Dinic'tis, a genus of sabre-tooth tigers of the Oligocene Epoch in North America. The animal was as large as a Canada lynx, and of somewhat the same proportions, but with long tail. Its teeth were less specialized than in the later sabre-tooth tigers or the modern cats, 34 being retained out of the 44 which all primitive mammals possessed. It has many characters allying it with the civets (*Viverridæ*), and especially with the fossa (q.v.) of Madagascar, indicating the descent of cats and civets from a common ancestor.

Diniz, *dē'nēs*, Julio, pseudonym of Joaquim Guilherme Gomes Coelho, Portuguese novelist and poet: b. Oporto 14 Nov. 1839; d. there 12 Sept. 1871. He introduced the village story into Portuguese literature. His first work: 'The Rector's Wards' (1866), is also his best; it was followed by 'An English Family' (1867), describing middle-class life in Oporto. His poems were published in 1880.

Diniz da Cruz e Silva, Antonio, *ân-tō'nē-ō dē'nēs dā kroos ē sêl'vā*, Portuguese poet: b. Lisbon 4 July 1731; d. Rio Janeiro, Brazil, 5 Oct. 1799. A lawyer and official, in 1776 he was made counsel to the superior court at Rio Janeiro. He was one of the founders of the celebrated literary society, the Lisbon Arcadia. His poetry comprises sonnets, eclogues, elegies, songs, epigrams, epistles, and several volumes of Pindaric odes; a lengthy poem, 'Brazil's Metamorphoses'; and a heroicomic epic, 'Hyssop,'—modeled on Boileau's 'Lutrin,' but a spirited, original composition, far superior to Boileau's,—which was republished several times in France, and translated into French prose.

Dinka, a powerful tribe of Negritos who live on both sides of the White Nile between lat. 6° and 12° N. Their territory covers 60,000 square miles. They are intelligent, have some skill in making articles for household use, and also follow agriculture. Each village is governed by its own chief. Consult: Schweinfurth, 'In the Heart of Africa.'

Dinkard (the enactments of religion), an important compilation of information concerning the doctrines, customs, and writings of the religion of Zoroaster. In its present form, much of the work is a descriptive list of the contents of a larger and earlier work.

Dinocer'ata (Gr. *δεινός*, terrible, and *κέρας*, horn), an extinct order of mammals, approaching the elephant in size and movements, remains of which have been found extensively in the Eocene lacustrine sediments of southern Wyoming. The dinocerata include three genera—*Uintatherium* (most primitive type), *Dinoceras* (intermediate form), and *Tinoceras* (youngest and most specialized). About 30 more or less distinct forms have been recognized.

Dinorah, *dē-nō'rā*, the title of an opera by Meyerbeer, produced in Paris 4 April 1859. The opera is now rarely presented. Its single effective scene is a shadow dance, with accompanying song.

Dinor'nis, a genus of large wingless birds, classed among the *Struthionidæ* or ostrich tribe, the fossil bones of various species of which have been found in New Zealand. These birds had bones devoid of air-passages, were three-toed, and some of them must have been of immense size. The *D. giganteus*, for example, is estimated to have been about 12 feet tall. See DINORNITHES.

Dinornithes. A group of extinct, flightless, ratite birds of gigantic size, the moas of New Zealand, with small heads, stout legs, usually with a hallux, wings absent or extremely reduced, furculum absent, and aftershafts large. The genera were *Dinornis*, *Pachyornis*, *Mesopteryx*, *Anomalopteryx* and *Megalopteryx*. See MOA.

Dinosauria, *dī-nō-sā'rī-ā*, an extinct order of *Reptilia*, with many characters allying them to birds in the structure of the skull and skeleton. The body was covered with scales or bony plates, the limbs long and stilted, the tail massive, and equaling or exceeding the rest of the body in length. Many of them were of gigantic size, beyond that of any other land animals living or extinct, and exceeded only by the whales. During the Triassic, Jurassic, and Cretaceous periods, this group was the dominant form of terrestrial life, occupying the same relative position as did the mammalian quadrupeds during the Tertiary, or as does man at present. The most ancient known dinosaurs of the Triassic Period were carnivorous land animals of moderate size, and comparatively light and agile; later appeared huge, massive herbivorous quadrupedal and bipedal types, some scale-covered, others with heavy bony plates, spines, horns, and frills to protect them against their carnivorous enemies. They disappeared at the close of the Cretaceous Period, leaving no descendants or near relatives. Like other reptiles, they appear to have been cold-blooded, slow-moving, and unintelligent compared with the mammals which succeeded them, and less able to adapt themselves to the new conditions of life brought about by gradual changes of climate during geologic time. Their extinction paved the way for the predominance of the mammals and their evolution into the various modern races.

Dinosaurs are divided into three or four orders or sub-orders of very diverse appear-

1. Skeleton of the Elephant-footed Dinornis.
2. Skeleton and Outline of the Dodo.

3. Duckbill (*Ornithorhynchus anatinus*).
4. A typical Paradoxure (*Dasyurus viverrinus*).

5. Manatee (*Manatus americanus*).
6. Dolphin (*Delphinus delphis*).

DINOTHERIUM — DINWIDDIE COURT-HOUSE

ance: (1) *Sauropoda*, or amphibious dinosaurs, quadrupedal, herbivorous, with long neck, small head, weak teeth, short elephantine five-toed feet, and blunt claws. These have been found only in Jurassic and Lower Cretaceous strata, and include the largest members of the sub-class. *Brontosaurus*, *Diplodocus*, *Camarasaurus*, and *Morosaurus* are the best known. (2) *Theropoda*, or carnivorous dinosaurs, bipedal, carnivorous, with sharp teeth, bird-like hind legs and feet, three-toed or four-toed, and large sharp claws on both fore and hind feet. It includes *Megalosaurus*, *Allosaurus*, etc. (3) *Preidentata*, or beaked dinosaurs, herbivorous terrestrial hoofed types with the front of the jaws covered by a horny bill or beak. These include the most highly specialized and bizarre forms, and were the latest development of the order, found chiefly in the Cretaceous Period. They are divided into three groups: (a) *Iguanodontia*, unarmored, bipedal, with small fore limbs and three-toed bird-like feet (but with hoofs instead of claws). *Iguanodon*, *Claosaurus*, and *Hadrosaurus* are the best known, each about 30 feet long. The skull of *Hadrosaurus* is four feet in length, and behind the horny beak is a magazine of several rows of small rod-like teeth set on end close together and wearing to a tessellated grinding surface like a mosaic pavement. (b) *Stegosauria*, heavy, quadrupedal, with five-toed elephantine feet, small head, large projecting bony plates on the back, and stout spines on the tail. The teeth are small and weak, somewhat like those of the iguana. *Stegosaurus* is the best known. (c) *Ceratopsia*, heavy, quadrupedal, with elephantine feet and very large head, with enormous horns projecting forward, and a great bony frill projecting backward and upward, and completely covering the short thick neck. The skull of *Triceratops* is sometimes eight feet long. The teeth of the *Ceratopsia* are like those of the iguanodonts, but larger and with fewer rows.

The brain in dinosaurs was disproportionately small, especially in the herbivorous types, and indicates a lower order of intelligence than in most modern reptiles. It is greatly exceeded in size by the spinal ganglia in the sacrum which govern the reflex (automatic) movements of the hind limbs and tail. Hence we may infer that the actions of these creatures were largely automatic and unintelligent, and this explains in part why they were unable to adapt themselves to the changes in physical geography, climate, and vegetation which ushered in the Cenozoic or modern era of geological time, and became totally extinct.

Comparatively little was known about the dinosaurs before 1880, but since that time the exploration and research of American palæontologists, and especially of the late Prof. O. C. Marsh in the fossil fields of Wyoming, Colorado, and other western States, have greatly extended our knowledge, and shown how important a part these creatures played in geological history. The proper collecting of these huge skeletons, and their extraction from the rock without injury, is a difficult and tedious operation, and requires considerable funds, so that only a few well-equipped museums have been able to afford it. The chief collections in this country are in the museums of Washington, New York, New Haven, Pittsburg, and Chicago. It is not yet practicable to trace the evolution of the different races of dinosaurs, as has been

done with most of the mammal races, and much remains to be discovered as to the structure and habits even of the better known species.

W. D. MATTHEW,
American Museum of Natural History.

Dinotherium (Gr. *δεινός*, terrible; *θηρ*, beast), a genus of elephantine mammals occurring as fossils in the Tertiary rocks of Europe and India, characterized by having the lower incisors developed into dome-curving tusks and by having all the molar teeth in use at once. They probably had a proboscis like that of the elephants.

Dinsmore, Hugh Anderson, American lawyer: b. Benton County, Ark., 24 Dec. 1850. He was clerk of the circuit court 1873-4, when he was admitted to the bar, and began practice in Fayetteville; was prosecuting attorney of the 4th judicial district of Arkansas in 1878-84; a Democratic presidential elector in 1884; minister-resident and consul-general in the kingdom of Korea in 1887-90; and a member of Congress in 1893-1903.

Dinwiddie, Robert, British colonial official: b. Scotland about 1690; d. Clifton, England, 1 Aug. 1770. He was lieutenant-governor of Virginia 1752-8; and during his official career recommended the annexation of the Ohio valley and the erection of forts to secure the western frontier against the French. He was one of the most earnest supporters of the French and Indian war, which began about 1753 and lasted 10 years.

Dinwiddie, William, American journalist and author: b. Charlottesville, Va., 23 Aug. 1867. When only 14 years of age, he was assistant electrician of the National Museum at Washington. He became inspector of customs at Corpus Christi, Texas, in 1883; was connected with the Bureau of American Ethnology from 1886 to 1895, at which time he went into journalism, serving as correspondent and illustrator for the *New York Herald*. He became photographer for the Baltimore & Ohio Railroad in 1897. During the campaign in Cuba and Porto Rico he served as war correspondent. He has published: 'Puerto Rico and Its Possibilities'; 'The War in the Philippines'; 'The War in South Africa.'

Dinwiddie Court-House and White Oak Road, Battles of. Gen. Grant, while besieging Petersburg, issued orders 24 March 1865 for a movement on the 29th to destroy the railroads leading into the city from the south, force Gen. Lee to come out of his entrenchments and fight on open ground, or so far attenuate his line that a successful assault could be made. The result was the battle of Five Forks (q.v.), the fall of Petersburg and Richmond, the surrender at Appomattox, 9 April and the close of the Civil War. The movement to the left was led by Warren's Fifth corps and Sheridan's cavalry, and the first encounter was near the Boydton road, where Warren's leading division (Griffin's) defeated two brigades sent out from Lee's right, driving them back to White Oak road. On the 30th the Second and Fifth corps closed in on the White Oak road on Lee's right, and Wilcox's Confederate division, coming out of the entrenchments, attacked Warren and was driven back. Warren's advance division was now within 600 yards of the road, and, on the

31st, Lee ordered another attack. Hunton's and Wise's brigades attacked in front, and McGavan's and Gracie's on the left flank. Ayres' and Crawford's divisions were driven back in disorder upon Griffin's division, which checked the Confederate advance. Gen. Miles, with two brigades of the Second corps, struck Wise's brigade on the left flank, drove it back with severe loss in killed and wounded, and the entire Confederate attacking party retreated, and Warren, resuming the offensive, pushed his advance across the White Oak road. It cost the Second and Fifth Union corps, on the 31st, 1,311 killed and wounded, and 556 missing.

Meanwhile Sheridan had reached Dinwiddie Court-House, 12 miles southwest of Petersburg, and on the 30th Devin's division and Davies' brigade were pushed 10 miles in advance in the direction of Five Forks, where they encountered the Confederate cavalry under Gen. Fitz Hugh Lee. At night Gens. W. H. F. Lee and Rosser joined Fitz Hugh Lee, and Gen. Pickett, with five brigades of infantry, marched down the White Oak road to Five Forks, and assumed command of all the troops operating against Sheridan. Munford's cavalry division engaged Devin in front and Pickett moved with infantry and the other two divisions of cavalry to gain Sheridan's left, crossed Chamberlain's creek, struck Davies' brigade in flank and drove it back on Devin, interposed between Devin and Crook, and with the assistance of Munford drove both Davies and Devin northeastwardly across the country. Fitz Hugh Lee moved up and formed his cavalry on Pickett's flanks. In following Devin and Davies, Pickett had exposed the rear of his column and it was attacked by the brigades of Gibbs and Gregg, which attack forced Pickett to face about. He drove back the two brigades and advanced upon Dinwiddie Court-House. Sheridan had called up Custer with his two brigades, some artillery had come up, and a barricade was thrown up about three fourths of a mile northwest of the court-house, behind which Gibbs and Gregg rallied, and Smith's brigade, slowly driven back by the Confederate cavalry, formed on the left. It was now near sunset, and as Pickett advanced, artillery opened upon him, and when within short range the cavalry from behind the barricades poured such a shower of bullets upon him that he was quickly repulsed, and the battle of Dinwiddie Court-House was over. Sheridan says his loss was about 450. The Union forces engaged at Dinwiddie Court-House and White Oak Road numbered about 42,000; the Confederates about 20,000. The Union loss 29-31 March was 2,198 killed and wounded, and 583 missing. The Confederate loss is unknown. Consult: 'Official Records,' Vol. XLVI.; Humphreys, 'The Virginia Campaign of 1864-5'; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; Grant, 'Personal Memoirs,' Vol. II.; Sheridan, 'Personal Memoirs,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Di'ocese, the territory and population over which a bishop exercises jurisdiction. The word diocesis was originally a term of civil administration, when toward the end of the 3d century the Roman empire was divided into 12 dioceses governed by the emperor's lieuten-

ants, each diocesis comprising several of the divisions called provinces. When the word came into ecclesiastical use it signified rather one of the grand divisions, patriarchates or primate jurisdictions, instead of the territory presided over by one of the bishops subject to a patriarch or primate or an archbishop. The word began to be used in the meaning it now has in the latter part of the 13th century; but even later it was used in the sense of our present word parish.

Diocle'tian (Caius Aurelius Valerius Diocletianus, surnamed Jovius), Roman emperor: b. Dioclea, Dalmatia, 245 A.D.; d. near Salona, Dalmatia, 313. He was made emperor by the army 284 A.D. and was generally beloved for the goodness of his disposition. But troubles disturbed the Roman empire, and compelled him to share the burden of government with colleagues; at first with M. Aurelius Valerius Maximian (286), who defeated the Gauls. Diocletian, at the same time, was successful against the Persians in the East, and afterward penetrated to the sources of the Danube, in Germany. He subsequently, in 292, named C. Galerius, Cæsar, and Maximian raised Constantius Chlorus to the same dignity. Thus the empire was divided into four parts. Diocletian resigned the imperial dignity at Nicomedia (305), as did Maximian at Milan at the same time. Diocletian retired to Salona in Dalmatia, where he found happiness in the cultivation of his garden. In the latter part of his reign he was induced to sanction a persecution of the Christians, whom he had long protected.

Diodati, Giovanni, jō-vā'n'ē dē-ō-dā'tē, Italian Protestant clergyman: b. Lucca about 1576; d. Geneva 3 Oct. 1649. He was for some time professor, first of Hebrew, then of theology, in Geneva, and in 1619 represented the Genevan clergy at the Synod of Dort, and aided in drawing up the Belgic confession of faith. He is most celebrated for a translation of the Bible into Italian, which is superior to his translation of it into French.

Diodon, dī'ō-dŏn, a genus of teleostean fish, family *Gymnodontes*, order *Plectognathi*, deriving their name from the fact that the ivory-clad terminations of the jaws show no suture, and the fish thus appear to possess but two teeth. The body, as in other members of the family, can be inflated with air till the creature floats on the surface of the water under side uppermost; it is likewise covered with ossifications in the skin, each with a pair of lateral roots and a stiff, movable, erectile spine. The rotundity of these fish when distended has earned for them the name of globe-fish, or prickly globe-fish, in addition to the designations porcupine-fish and sea-hedgehog, suggested by the numerous spines. The four species of *Diodon* are found in all the seas between the tropics, and range to the Cape of Good Hope. The largest species (*D. hystrix*) attains the length of two feet six inches. The food of *Diodon* consists of crustaceans and seaweeds, for the trituration of which its jaws are admirably adapted. This genus has by some naturalists been made the type of a family *Diodontidae*.

Diod'orus (surnamed SICULUS), Greek historian: b. Agyrium, Sicily; fl. second half of 1st century. In order to render his history as complete and exact as possible, he traveled through a great part of Europe and Asia. It

is very much to be regretted that the greater part of this history, which the author called the 'Historical Library,' in the composition of which he combined the ornaments of rhetoric with the detail of facts, after the example of Theopompus and Ephorus, and on which he had bestowed the labor of 30 years, has not reached our times. It consisted of 40 books, and comprised the history of almost all nations. It is written in the style of annals, and the events are narrated in a confused and discordant manner; but the work is valuable as containing a great mass of materials collected from a number of writers whose works have perished. Only the books 1 to 5 and 11 to 20, and a number of fragments, are now extant.

Diœcious, di-ê'shūs, in botany, a term applied to unisexual plants, such as the willow and the hemp, in which the stamiferous and pistilliferous flowers are on separate individuals. In zoology, a term applied to those animals in which the sexes are distinct; that is, those in which the ovum is produced by one individual (female) and the spermatozoid by another (male). It is opposed to monœcious.

Diog'enes of Apollonia, Greek philosopher: b. Apollonia, Crete, fl. in the 5th century B.C. Very little is known of his life. His philosophical speculations were developed in his work 'On Nature,' still extant in the 6th century, but of which we have at present only fragments, preserved in the works of Aristotle, Diogenes Laertius, and Simplicius. His great object was to find the first principle of the world, out of which all things were evolved. Like his master Anaximenes, he came to the conclusion that this great first principle was air.

Diogenes Laer'tius, Greek philosopher: b. Laerte, Cilicia, toward the close of the 2d century A.D. His chief work is 'Lives, Doctrines, and Apophthegms of those who have distinguished themselves in Philosophy.' The book is full of absurd and improbable anecdotes, and characterized by much confusion and careless mistakes, yet as containing a mine of information regarding the private life of the Greeks, and many fragments of works now lost, it is of considerable value. It was long the foundation of most modern histories of philosophy, and has preserved the names and doctrines of numerous writers, of whom but for it little would have been known.

Diogenes of Sino'pe, the most famous of the Cynic philosophers, was born about 412 B.C., in Sinope, a city of Pontus in Asia. Having been banished from his native place with his father, who had been accused of coining false money, he went to Athens, and requested Antisthenes to admit him among his disciples. That philosopher in vain attempted to repel the importunate suppliant, even by blows, but finally granted his request. Diogenes devoted himself, with the greatest diligence, to the lessons of his master, whose doctrines he extended still further. At the same time he applied, in its fullest extent, his principle of divesting himself of all superfluities. He taught that a wise man, in order to be happy, must endeavor to preserve himself independent of fortune, of men, and of himself: in order to do this, he must despise riches, power, honor, arts, and sciences, and all the enjoyments of life. He endeavored to exhibit, in his own person, a model of Cynic

virtue. For this purpose he subjected himself to the severest trials, and disregarded all the forms of polite society. He often struggled to overcome his appetite, or satisfied it with the coarsest food; practised the most rigid temperance, even at feasts, in the midst of the greatest abundance, and did not even consider it beneath his dignity to ask alms. By day he walked through the streets of Athens barefoot, without any coat, with a long beard, a stick in his hand, and a wallet on his shoulders; by night he slept in a tub, though this last has been doubted. He defied the inclemency of the weather, and bore the scoffs and insults of the people with the greatest equanimity. Seeing a boy draw water with his hand, he threw away his wooden goblet as an unnecessary utensil. He never spared the follies of men, but openly and loudly inveighed against vice and corruption, attacking them with satire and irony. The people, and even the higher classes, heard him with pleasure, and tried their wit upon him. When he made them feel his superiority, they often had recourse to abuse, by which, however, he was little moved. On a voyage to the island of Ægina he fell into the hands of pirates, who sold him as a slave to the Corinthian Xenias in Crete. The latter emancipated him, and entrusted him with the education of his children. In summer he lived at Corinth, and in winter at Athens. It was at the former place that Alexander found him on the roadside basking in the sun, and astonished at the indifference with which the ragged beggar regarded him, entered into conversation with him, and finally gave him permission to ask for a boon. "I ask nothing," answered the philosopher, "but that thou wouldst get out of my sunshine." Surprised at this proof of content, the king is said to have exclaimed: "Were I not Alexander, I would be Diogenes." At another time he was carrying a lantern through the streets of Athens in the daytime: on being asked what he was looking for, he answered, "I am seeking a man." Thinking he had found in the Spartans the greatest capacity for becoming such men as he wished, he said, "Men I have found nowhere; but children, at least, I have seen at Lacedæmon." We are told that Socrates once remarked to him, "I see your vanity through the holes of your coat"; but chronology will not admit of the truth of this anecdote. No doubt many of the anecdotes told of this singular man are fiction. He died 323 B.C., at a great age. When he felt death approaching, he seated himself on the road leading to Olympia, where he died with philosophical calmness, in the presence of a great number of people, who were collected around him.

Diogne'tus, Epistle to, a defense of the beliefs and the religious and social usages of the Christians, written in the 1st century by one who appears to have been himself a disciple of the apostles, but of whose name and history nothing is known. He refutes the false and malicious accusations brought against his brethren—as that in their assemblies they were wont to practise abominable immoralities, that they were atheists, enemies of all government, etc. He writes with the simplicity and candor of one who has nothing to conceal or to explain away; who rather pities the ignorance of the persecutors than reproaches them for their cruelties.

DIOMEDE ISLANDS — DIONYSIUS THE AREOPAGITE

and injustices. "The Christians," he writes, "live in their fatherland, but like wayfarers in a strange land; citizens themselves, they share with their stranger brethren; they calmly bear all adversities; they find a fatherland everywhere: but their earthly fatherland is an exile. They marry, like others, but unlike others they do not expose their babes. They live in the flesh, but not according to the lusts of the flesh. They are dwellers on earth, but their true home is heaven. They obey the laws and by their mode of life rise superior to all law. They love all mankind, and all men persecute them. They are delivered up to death and death is for them deliverance."

Di'omede Islands, a group of three small islands in Bering Strait, and midway between Asia and America. They were discovered by Bering in the early part of the 18th century.

Diomedea, *dī-ōm-ē-dē'ā*, a genus of birds, including the various species of albatross (q.v.).

Diome'des, king of Argos. He was one of the heroes at the siege of Troy, the son of Tydeus. His daring courage rendered him one of the most distinguished heroes, and, according to the testimony of Nestor, superior to all his contemporaries. Protected by Pallas, he not only encountered the most valiant of the enemies, many of whom he killed, but even ventured to attack the immortals. He was equally distinguished in the council. He boldly opposed the proposal of Agamemnon to leave the plains of Troy without having gained the object of the expedition, and prevailed; he even adhered to his opinion after Achilles had rejected the proffered reconciliation. By carrying off the horses of Rhæsus from the enemies' tents he fulfilled one of the conditions on which alone Troy could be conquered. With Ulysses he removed Philoctetes, who had the arrows of Hercules, from Lemnos, which was another condition of the fall of Troy. Finally, he was one of the heroes who were concealed in the wooden horse by whom the capture of Troy was at length accomplished.

Diomedes, Villa of. See POMPEII.

Di'on Cassius, Greek historian: b. Nicæa, Bithynia, about 155 A.D.; d. there after 230 A.D. He went to Rome about 180; was appointed successively to many high offices; was twice consul; and wrote, in Greek, the 'History of Rome,' from the arrival of Æneas in Italy to 229 A.D. The small portions extant of Dion's work are highly valued.

Dion Chrys'ostom. See CHRYSOSTOM, DION.

Dion of Syracuse, in Greek history, a connection by marriage of the elder and the younger Dionysius, tyrants of Syracuse, over whom he long exercised great influence. He attempted to reform the younger Dionysius, but his enemies succeeded in effecting his banishment. He afterward returned and made himself ruler of the city, but became unpopular, and in 353 B.C. was assassinated.

Dionæa (*dī-ō-nē'ā*) **Muscip'ula** ("Venus' fly-trap"), a plant of the sundew family (*Droseraceæ*), found in sandy bogs near the coast of the Carolinas. Audubon reported specimens of enormous size as growing also in Florida. It is a common plant in hothouses. It exhibits in a remarkable degree the irritability common to some plants. There are three hairs upon each division of the leaf, which are so

sensitive that an insect alighting upon one of them causes the two sides of the leaf suddenly to come together with considerable force, the strong bristles of the marginal fringe crossing each other like the teeth of a steel-trap, so as to retain the intruder, whose struggles to escape only increase the pressure of the leaf-trap. The insect is retained until its soft parts are digested and absorbed by the plants, after which the leaf opens and the hard parts drop out. This operation requires about 14 days, but if the insect exciting the leaf is not caught, the leaf opens again after an hour or two. The leaf does not retain its vigor for any length of time, gradually becoming inert and drying up. Consult: Darwin, 'Insectivorous Plants.'

Dio'ne, in Greek mythology, the mother of Aphrodite (Venus).

Dionysia, *dī-ō-nish'ā*, festivals in honor of Dionysus, or Bacchus, which, originating in Egypt, were introduced into Greece by Melampus, 1415 B.C. They were four in number, the Rural or lesser Dionysia, which was the most ancient, the Lenæa, the Anthesteria, and the Dionysia proper, all of which were celebrated annually, with much extravagant merriment, though they were not disgraced by the excesses of the Roman Bacchanalia.

Dionysius, Saint, elected pope in the year 259. He is supposed to have been a native of Greece, but the exact date of his birth is not known. He died 26 Dec. 269, having reigned as pontiff 10 years. Prior to his election as pope he was held in high repute by the theologians of his day, as history states that Dionysius of Alexandria sent him a most important letter on baptism; and later he was the chief theologian in a synod (262) where the principal question had reference to the Trinity. His able commentaries convinced many who had held views different from those taught by the Church.

Dionysius, Saint, "OF ALEXANDRIA": b. Alexandria in the last years of the 2d century; d. there 265 A.D. His family were noble, wealthy, and pagans. Early in his life his philosophical studies turned his attention to Christian writings, and they so influenced his mind, especially the epistles of St. Paul, that he left the pagan schools and became a pupil of Origen. About the year 232 he was ordained a priest, and given charge of the Alexandrian school of theology. In 248 he was consecrated bishop. Shortly after he became bishop of Alexandria the persecution of Decius began, and Dionysius was among the first arrested, and sentenced to be tortured and beheaded. He was rescued by a band of peasants, and for more than a year remained concealed in the Libyan desert. In 257, during the persecution under Valerian, he was again exiled from Alexandria. The writings of Dionysius were numerous, but many have been destroyed. His works were chiefly controversial, or attacks on the heresies of his day. Consult: Butler, 'Lives of Saints'; the English translation, 'Ante-Nicene Fathers.'

Dionysius the Areopagite, converted to Christianity by St. Paul (Acts xvii. 34), during the apostle's visit to Athens. Dionysius is called the Areopagite because he was a member of the high court of Athens, the *Areopagus*, which held its sessions on Mars Hill. It was generally believed by the early historians that this Diony-

DIONYSIUS THE ELDER — DIOPSIDE

sius was ordained a priest, was made bishop of Athens, and ended his life by martyrdom. The New Testament tells us only that he "did believe" and adhered to St. Paul. He has been wrongfully credited with being the author of certain ancient writings on subjects chiefly mystical which, though attributed to that member of the court of Areopagus who was converted to Christianity by the preaching of the Apostle Paul, Acts xvii. 34, must be referred to some unknown writer of the 4th or the 5th century: hence the author is now usually styled Pseudo-Dionysius, or Dionysius Pseudo-Areopagite. The titles of the works attributed to the Areopagite, and which seem to have been his writings, are 'The Heavenly Hierarchy'; 'The Ecclesiastical Hierarchy,' 'Divine Names,' 'Mystical Divinity.' Ten letters are attributed to him, purporting to be addressed to St. John the Evangelist, Titus, Polycarp, and others, their contemporaries. These writings came first into notice in 533 at Constantinople when certain Monophysite heretics presented them in confirmation of their doctrines: but they were repudiated by the orthodox as manifestly spurious. Nevertheless before long they came into high favor both in the East and the West and throughout the Middle Ages were received by the most eminent schoolmen as indispensable monuments of the teaching and belief of the early Church. Mgr. Darboy says: "There is scarcely a passage in the writings of Pseudo-Dionysius that has not been quoted by Thomas Aquinas."

Dionysius the Elder, Syracusan tyrant: d. 367 B.C. He contrived to make himself master of the citadel of Syracuse, together with all the arms and provisions contained in it, and finally to declare himself tyrant, at the age of 25 years. After having finished a short war against the Carthaginians he made preparations for a great war against Carthage. He attacked the Carthaginians at once by land and water, and gained a complete victory, which was soon followed by an advantageous peace. In 368 he commenced a new war against the Carthaginians, intending to drive them entirely out of Sicily. He did not, however, succeed in this attempt, and was obliged to conclude a disadvantageous peace. He holds the unenviable place in ancient history as the representative tyrant. He lived in continual dread of assassination, of which the sword of Damocles has become the symbol. He had the state prison so constructed that even the solitary murmurings of its inmates could be heard by him, and it was hence called the Ear of Dionysius.

Dionysius the Younger, Syracusan tyrant. He succeeded his father, Dionysius the Elder. Dion his kinsman directed his attention to the doctrines of Plato, representing to him that this great philosopher alone was able to teach him the art of government, and the means of rendering his subjects happy. In consequence of this advice Dionysius invited Plato to his court. The latter succeeded in tempting him into the path of virtue and knowledge, and in giving a new character to his whole court. An opposite party, however, awakened the king's suspicions against Dion, and caused his banishment. Dion subsequently made himself master of Syracuse, to which Dionysius did not return until after the murder of Dion. The rule of Dionysius now

became so oppressive that Timoleon appeared with a fleet before Syracuse, and expelled the tyrant. Dionysius was carried to Corinth, where he is said to have gained a scanty living by giving lessons in grammar.

Dionysius, Ear of. See EAR OF DIONYSIUS.

Dionysius Exiguus, an eminent scholar of the 6th century. He it was who introduced the now existing method of calculating the Christian era. He was a monk and, according to his close friend Cassiodorus, was of Scythian origin (*natione Scythia*). His surname Exiguus (little) was perhaps self-assumed by him out of humility, for lowly mindedness is one of the virtues enumerated by Cassiodorus in his eulogy of his friend; but the surname may have had reference to his stature. His reputation was high as a theologian and as one intimately conversant with the Scriptures and with the ordinances of the Church. He is author of a collection of ecclesiastical constitutions and canons which is still extant. Many writings of ancient Greek authors have been saved for us in the translations made of them into Latin by Dionysius.

Dionysius of Halicarnassus, Greek critic, historian, and rhetorician: b. about 50 B.C.; d. 7 B.C. He came to Rome about 29 B.C., and lived there on terms of intimacy with many distinguished contemporaries till his death. His most valuable work is his Greek 'Archæologia,' a history of Rome down to 264 B.C. Of the original 20 books, we possess only the first nine in a complete form. He was a greater rhetorician and critic than historian, and his extant works on oratory, on the criticism in detail of the great Greek orators, on the characteristics of poets and historians from the time of Homer to Euripides, and upon Thucydides and Dinarchus, possess great interest and value.

Dionysus, δι-ὸ-νῆ-σῦς, the original Greek name of the god of wine, the name Bacchus, by which he was also called by both the Greeks and the Romans, being at first a mere epithet or surname. See BACCHUS.

Diophantine Analysis, that branch of algebra which treats of the method of solving certain kinds of indeterminate problems relating principally to square and cube numbers, and rational right-angled triangles. The following are examples: (1) To separate a given square number into two parts, each of which shall be a square number; (2) to find three square numbers which are in arithmetical progression; (3) to find a right-angled triangle whose sides shall be commensurable with each other.

Diophantus of Alexandria, Greek mathematician. He flourished, according to some authorities, about the middle of the 4th century, according to others about the end of the 6th. He left 13 books of 'Arithmetical Questions,' of which only six are extant; and a work on 'Polygon Numbers.' See DIOPHANTINE ANALYSIS.

Diopside, δι-ὀπ-σῖδ, a variety of the mineral pyroxene occurring in monoclinic prisms. It is a silicate of calcium and magnesium, having the formula, $\text{Ca Mg} (\text{SiO}_3)_2$. Iron is occasionally present in considerable amount, replacing the magnesium, and it then graduates towards hedenbergite. It has a hardness of

DIOPTASE—DIOSCURUS

about 6, and a specific gravity of about 3.3. It is usually pale green to nearly colorless and when transparent yields gems of considerable beauty. The finest gems come from Dekalb, New York, where it occurs in transparent crystals varying from colorless to a deep, rich green. Ala, Piedmont, is another celebrated locality.

Diopase, *dī-ōp'tās*, a rare, beautiful and highly prized mineral, occurring in prismatic crystals of rich emerald-green color and vitreous lustre. Its inferior hardness, 5, greater specific gravity, about 3.3, the terminal rhombohedrons on its crystals, and its reactions for copper, easily distinguish this so-called "emerald-copper" from the true emerald. It is found sparingly near Clifton and near Riverside in Arizona, also in the French Congo, Chile and Hungary, but the finest specimens are from Russia.

Diop'trics (from Gr. *dia*, through, *ōp*, see), the science which treats of the refraction of the rays of light, when the rays pass through different refracting mediums—for instance, from the air, through the lenses of a telescope. Diop'trics, consequently, is a branch of optics. It demonstrates the different directions in which the rays move, according as they are broken on plane or curved surfaces. The principles deduced from these observations determine the nature of the various lenses, explain the manner in which the light is refracted in the human eye, teach the manner of making telescopes, microscopes, etc. The ancients were not acquainted with this science. Natural science in modern times has been greatly indebted to it. By its aid the human eye has been enabled to reach objects previously unknown. Kepler, Snellius of Leyden, Descartes, Newton, etc., not only extended this science, but founded a great part of their discoveries on it. In modern times, science has been enriched by the invention of the achromatic telescope. See LENS; OPTICS; REFRACTION; TELESCOPE.

Diorama, a method of reproducing landscape scenery, invented or perfected by M. Daguerre, and first exhibited by him in 1823. The particular advantage which this method possesses is, that it causes the light to play over the picture with an intensity graduated at will. The illusion is heightened by the transparencies, through which light is poured from behind the picture. The principle of the diorama has been successfully applied in producing some of the prettiest scenic effects of the modern stage.

Diorite, *dī'ō-rīt*, a rock consisting essentially of hornblende, biotite mica, and plagioclase feldspar that have a granitoid, or completely crystalline, texture. According to variations in composition, there are augite-diorites which grade into gabbros and quartz-diorites which grade into granites. The hornblende and augite-diorites are dark-colored; the quartz-diorites, light-colored. As augite changes readily to hornblende, many so-called diorites may represent altered diabases and gabbros; by further metamorphism the hornblende changes to chlorite. Diorites under shearing stresses may be changed into hornblende and chlorite schists. Andesites and dacites are rocks of the diorite family, but having a porphyritic texture. As compared with the syenites, diorites contain less potash and soda but more lime and magnesia, hence the principal feldspar is soda-lime. True diorites are

rare in the United States, though quartz-mica diorites and augite-diorites are not uncommon, and grano-diorites—the intermediate stages between diorite and granite—occur in great masses in the Sierra Nevada, in California. True diorites occur in various places abroad. One from Wales contains: SiO_2 61.75; Al_2O_3 18.88; Fe_2O_3 0.52; FeO 3.52; CaO 3.54; MgO 1.90; Na_2O 3.67; K_2O 1.24; and has a specific gravity of 2.79.

Dioscoreaceæ, *dī-ōs-kō-rē-ā'sē-ē*, a natural order of monocotyledonous plants, with alternate reticulate-veined leaves, tuberous rootstocks, and twining stems. The flowers are small and unisexual. There are nine genera, with about 175 species, chiefly inhabiting tropical America and South Africa. The typical genus is *Dioscorea*, which includes the yam of commerce (*D. sativa*). The best-known species in eastern America is the wild yam-root (*D. villosa*), which is found in moist thickets from Rhode Island north, south to Florida, and west to Texas. It ascends to 4,000 feet in the Virginia Mountains. The flowers are of a greenish-yellow bloom in June and July, and the fruit, which adheres to the vine until late in the winter, is ripe in September. *Tamus* (*Tesudinaria*) *elephantines*, a South African species, sometimes called elephant's foot, and Hottentot's bread, has a large fleshy rhizome, with a rough cracked bark, which is used as food by the Hottentots in times of scarcity.

Dioscorides, *dī-ōs-kōr'ī-dēz*, **Pedanius**, physician: b. Anazarbus (Cæsarea Augusta), in Cilicia, in the 1st century A.D. He was author of a celebrated work on materia medica, in five books. It is particularly valuable in regard to botany, as most of the medicines which the author mentions are taken from the vegetable kingdom. Two other works are also attributed to him—the 'Alexipharmaca,' which was united with the 'Materia Medica,' forming the three last books of it, and treating of the poisons in the three kingdoms of nature, and their antidotes; and the 'Euporista,' which treats of remedies that are easily procured. The best edition of Dioscorides is that of Sprengel (1829-30).

Dioscuri, *dī-ōs-kū'rī*, the classical name for Castor and Pollux, twin brothers, and tutelary deities of wrestlers, horsemen, and navigators. Their transplantation to the sky as one of the 12 constellations of the zodiac (the Twins) is a celebrated allegory of mythology. They are sometimes styled Tyndaridæ, because Tyndarus was the nominal father of both.

Dioscūrus, or **Dioscorus**, patriarch of Alexandria, immediate successor (444) of St. Cyril, was a supporter of the heresiarch Eutyches (q.v.). Pope Leo and Flavianus, patriarch of Constantinople, having condemned the teachings of Eutyches, Dioscurus procured from the Emperor Theodosius II. the convocation of a council of bishops at Ephesus in 449. To this council Pope Leo sent three legates as his representatives. Dioscurus was present, surrounded by a host of his satellites, and with their aid prevented the legates from presiding in the council and even from reading to the bishops the letters addressed to the assembly by Leo. Flavianus was so roughly handled by the rabble that he died shortly after in consequence of the injuries he received. The council thereafter got the title of Latrocinium (Brigandage) from the

Latins, and of Σύνοδος ληστρική from the Greeks (robbers' synod); but Theodosius upheld its decisions, and Dioscurus procured the appointment of one of his partisans, Anatolius, to succeed Flavianus in the see of Constantinople. After the death of Theodosius another council assembled at Chalcedon in 451, which annulled the decrees of the Latrocinium of Ephesus and decreed the deposition of Eutyches from his offices as presbyter and archimandrite.

Dios'ma, a genus of plants belonging to the rue family (*Rutaceæ*). They are small shrubs with white or red flowers; leaves alternate or opposite, simple. They are remarkable for their overpowering and penetrating odor, arising from the presence of a yellowish volatile oil. They are the buchu plants of the Cape of Good Hope. The plant has been employed in chronic affections of the bladder and urinary organs in general, and has also been administered in cholera.

Dios'pyros, a genus of plants belonging to the ebony family (*Ebenaceæ*). There are about 160 species, most abundant in Asia. They consist of trees and shrubs with white or pale yellow flowers. *D. lotos* is the Indian date-plum, and is supposed by some to be the lotus of the ancients. The trees of several of the species furnish ebony wood. The fruit of *D. kaki* is occasionally brought from China as a dry sweetmeat. *D. virginiana*, the American representative of the family, is the persimmon (q.v.).

Dip, in geology, the angle of inclination of any stratified rock to the horizontal of its bedding planes. In the same way the cleavage planes of any metamorphic rock are said to dip and a thin intrusion of igneous rock, a dike, has a dip. Also the contact plane of an igneous and a sedimentary rock may have a well-defined dip. The direction of the dip is the line of highest inclination and is expressed by compass bearing; thus a bed may dip 63° N., 35° E. The angle of dip is determined by an instrument known as a clinometer. Initial dip is the name given to the slight inclination away from the land that sedimentary beds have as a whole when laid down in the sea. Such initial dips are often of importance in determining flexures when the sediments are subsequently subjected to mountain-building pressures. See FAULT; FOLD; GEOLOGY; MOUNTAIN.

Diphthe'ria (Gr. *diphthera*, a skin, piece of leather, extended in meaning to comprise membrane), a contagious and (in its severe forms) malignant disease, caused by a specific bacillus, and generally characterized by the formation of a fibrinous false membrane in the throat. Although previously observed, it was first clearly described in 1826 by M. Bretonneau of Tours under the name of "diphtherite," as a form of very fatal sore throat occurring chiefly in children. It is now known that most cases of membranous croup are identical with diphtheria. The membranous inflammations of the throat occurring sometimes in scarlet fever and other infectious fevers may or may not be true diphtheria, a bacteriological examination being usually necessary to determine this point.

The period of incubation is usually from two to seven days. The disease begins by malaise, feeling of chilliness, loss of appetite, headache and more or less fever; soon the throat feels hot and painful and the neck is stiff and

tender. If seen early, the throat is red and swollen, but a false membrane of yellowish or grayish color quickly appears in spreading patches, usually first on the tonsils, whence it often spreads to the pillars of the fauces, uvula and back of the throat, and may even extend down the cesophagus or gullet; extension of the membrane into the nasal cavities is a grave symptom. There is usually enlargement of the glands at the angle of the jaw, and albuminuria generally occurs at some stage of the disease. Diphtheritic membrane may be formed on any mucous surface, or even on a wound; if it extends into the larynx it gives rise to cough and difficulty in breathing. The throat affection is often accompanied by a low and very dangerous form of fever, with quick, feeble pulse and great and rapid loss of the patient's strength, which is still further reduced by the inability to take food; in other cases, the disease is fatal by paralysis of the heart or by suffocation, due to invasion of the larynx. Invasion of the larynx may necessitate intubation or tracheotomy. After the acute disease is over, the recovery may be delayed by paralytic symptoms of various kinds; or simply by extreme debility with exhaustion and loss of appetite. In the early stages of convalescence there is danger of sudden heart failure upon exertion.

Diphtheria is contagious. It may occur as a complication of scarlet fever, measles, and other infectious diseases. All gradations in the intensity of the disease from mild sore throat to septic and gangrenous forms occur. Damp and temperate climates seem to favor its development. Insanitary conditions favor its occurrence, but the disease may appear under the most favorable hygienic surroundings. An important mode of its spread is by school children, either infected in a mild form or coming from households where the disease exists. One attack affords little or no protection against recurrence. In the treatment of the disease the patient should be isolated and all clothing and other articles which have been in contact with the sick, as well as the discharges, should be disinfected. Local applications to the diseased parts and means to maintain the strength of the patient were the most valuable therapeutic measures before the introduction of the antitoxin treatment.

True diphtheria is now known to be caused by a specific bacillus called *Bacillus diphtheriæ*, or the Klebs-Löffler bacillus. This bacillus was first recognized by Klebs in 1883 by microscopical examination of diphtheritic membranes, but it was first successfully cultivated by Löffler in 1884. Its causal relation to the disease was not thoroughly established till the investigations of Roux and Yersin in 1888, who demonstrated the existence of a peculiar and intensely poisonous substance known as the diphtheria toxin. It is now generally admitted that the Klebs-Löffler bacillus is the cause of true diphtheria. The diphtheria bacillus is a slender rod characterized especially by irregularities in shape and staining with aniline dyes. It grows best at about the temperature of the human body, and all growth ceases below 20° C. It can be cultivated artificially on various media, but best on a mixture of blood serum and beef-broth rendered solid by heating. In a moist condition the bacilli are killed in a few minutes by a temperature of 60° C. They survive for months in a dried condi-

tion. Exposure to the direct rays of the sun kills the bacilli in a short time. Guinea-pigs, when inoculated beneath the skin with a small quantity of a pure culture of the virulent diphtheria bacillus, die within two to five days with characteristic changes in the body. Skilled bacteriologists can recognize the presence of diphtheria bacilli in the throat by microscopical examination and the appearances in the cultures within 24 hours or less, but their complete identification may require the inoculation of a guinea-pig. Both in human beings and in animals the bacilli grow only or mainly locally in the false membrane, the severe constitutional symptoms being due to the absorption of a powerful poison secreted by the bacilli.

The ways in which diphtheria bacilli may be conveyed from sick to healthy persons are almost countless. In ordinary breathing the expired breath contains no germs, but in speaking and especially in coughing, a fine spray is emitted which may contain the bacilli and thus convey the disease. All sorts of articles, such as handkerchiefs, toys, drinking utensils, furniture, clothing, bed-linen, and the like, may become contaminated with the bacilli and be the means of spreading the disease. The specific germs have been found in the hair, on the shoes, and elsewhere on the persons of those brought into frequent and close proximity to the patient. Direct contact with the patient, as in kissing, may communicate the disease. It is especially through direct or mediate contact with infected individuals that the disease is spread. Hence, preventive measures, consisting in isolation of the patient till the bacilli have disappeared from the throat, and in thorough disinfection, are of the first importance in checking the spread of diphtheria. Insanitary conditions, formerly thought to be the direct cause of diphtheria, are now regarded only as accessory causes in affording opportunities for the prolonged survival of the specific germs or in weakening the powers of resistance of the individual.

The discovery of the diphtheria bacillus has led to the introduction of a new and most successful method of treatment of the disease, known as serum-therapy or the antitoxin treatment. The establishment of the principles and the introduction of this treatment are due especially to Behring of Germany and Roux in Paris. The underlying principle of the treatment is based on the fact that, if a susceptible animal is inoculated first with small and then with increasing doses of the toxin produced by the bacillus, the blood of the animal is found to contain a substance called antitoxin, which has the power of neutralizing or rendering harmless the toxin. In order to obtain large quantities of the healing serum a horse is generally selected for the process of immunization. By proper methods very powerful antitoxins can be obtained. The antitoxin is used not only to cure the disease, but also to render persons insusceptible for a time to the disease. This latter procedure of preventive inoculation has been found especially useful in preventing extensive outbreaks in children's hospitals and asylums after the introduction of one or more cases of diphtheria. Dr. William H. Welch, of the Johns Hopkins University, in 1895, in an analysis of over 7,000 cases of diphtheria treated by antitoxin found that the fatality was reduced by this treatment by over 50 per cent of the previous

death-rates; he concluded that the antitoxin serum is a specific curative agent for diphtheria, surpassing in its efficacy all other known methods of treatment for this disease. Since his report, this conclusion has been confirmed and even more favorable results have been obtained.

Some idea of the great benefits which have been derived from the discoveries outlined above may be had by comparing the death rate before and after the serum therapy became the practice. For the five years immediately preceding the discovery and use of antitoxin in the city of Berlin the death rate for diphtheria in every 10,000 inhabitants was 10.2 per cent, and for the next five years it fell to 3.7 per cent; in Paris, 6.5 per cent before antitoxin, and 1.3 per cent afterward; in New York 14.5 per cent before, and 6.3 per cent after antitoxin. So safe is the use of antitoxin, it is now advised that every child exposed should receive an immunizing dose, as that confers protection.

WILLIAM J. WELCH, M.D.,
Professor of Pathology, Johns Hopkins University.

Diph'thong, two vowel sounds, following one another so closely as to form but one syllable, as in out, where the sound is really composed of a and u. Many double vowels in English are not real diphthongs, there being only one sound heard, whereas some single vowels have a diphthongal sound. The only real English diphthongs are i as in high; i as in aye; oi in boil; ow in how; and ew in mew.

Diple'gia. See PARALYSIS.

Diploblas'tica. See EMBRYOLOGY.

Diplococ'cus. See BACTERIA.

Diplodocus, dī-plōd'ō-kūs, a saurian-footed, herbivorous dinosaur found in the American Jurassic deposits. The length of skull of this species was about 21 inches, of brain about 3 inches, and of body 50 feet. The animal is supposed to have been a hippopotamus-like wader, and to have lived on vegetation in the water.

Diplo'ma (Gr. *diploō*, "fold" or "double"), originally a document on two tablets of wax (see DIPTYCH), or on writing material which was folded. The Roman emperors granted diplomas to couriers, giving them the use of public servants and horses; hence diploma came to signify a writing or document conferring some power, authority, privilege, or honor, usually under seal and signed by a duly authorized official. Diplomas are given to graduates of a university on their taking their degrees; to clergymen who are licensed to officiate; to physicians, civil engineers, etc., authorizing them to practice their professions.

Diplo'macy, simplified, means political negotiation. Commonly applied the term refers to international relations and the adjustment of differences between nations. The principle objects of diplomacy have always been and are to-day to preserve the independence, rights and security of state and nation. Under diplomacy has been preserved the European "balance of power," the prevention of general wars and the securing of commercial advantages under treaty regulations. As a matter of fact all treaties are the result of diplomacy. In the past there have been many international and other conventions or congresses of diplomats, to preserve the peace

of the world and to settle differences of international moment. Such was the congress of Westphalia held in 1648, to settle the issues involved in the Thirty Years' War; the Congress of Vienna (1814-15); and the more recent Hague conference (1899) held at the instance of the Czar of Russia, for the promotion of the peaceful settlement of international differences among civilized nations. In the various countries, under modern methods and conditions, the usual instruments of diplomacy are: (1) the secretaries of state for foreign affairs; (2) regular diplomatic agents or representatives of various grade ranging from ambassadors to *chargés d'affaires* or consular agents; (3) special embassies and diplomatic agents or representatives appointed for the accomplishment of a particular purpose, as the case of the Alaskan Boundary Commission at London (1903). Prior to the 15th century diplomats were of the last named class. See INTERNATIONAL LAW. Also consult: 'A Hundred Years of American Diplomacy' (1900).

Diplomat'ics, Diplomatic, the science of deciphering ancient MSS., inscriptions, etc. See PALEOGRAPHY.

Diplopia, dī-plō'pī-ā, an affection of the sight in which objects are seen double. It arises from derangement of the visual axis.

Diplop'terus, a genus of fossil ganoid fishes, of four species, belonging to the Old Red Sandstone.

Diploz'oon, a parasitic trematode worm which infests the gills of the bream, and which appears to be formed of two distinct bodies united in the middle, and resembling an X or St. Andrew's cross, two sexually mature individuals being thus united. The larva, formerly called *Diporpa*, swims about in the water for a time, but ultimately settles in the gills of a fish, where it remains during the rest of its existence. The larvæ then unite in pairs by the attachment of the ventral sucker of one individual to a knob on the back of another.

Dip'noi, one of the primary subdivisions of fishes, characterized by the presence of membrane or covering bones on the skull, the absence of secondary bony jaws (maxillary, premaxillary, and dentary bones), and the direct articulation of the lower jaw with the skull. The *Dipnoi* were early predominant in geological times, many and varied forms occurring as fossils in the Middle and Upper Palæozoic strata. Some of these, forming the order *Arthrodira*, are of doubtful relationship, and are classed with the *Dipnoi* only provisionally. The best-known representatives of this group have the anterior region of the body enclosed in continuous bony plates, with a complex articulation between the head and trunk. In the Devonian of Ohio are found giant forms, like *Dimichthys* and *Macropetalichthys*, from 10 to 25 feet long, and with sharp-beaked jaws like a turtle's. Numerous other *Dipnoi*, more closely resembling the still living ones, have been found as fossils in various parts of the world. At the present time the group is decadent, and but three genera and as many species, each found in a restricted area in widely separated regions of the earth, remain. They are, *Protopterus* from Africa, *Lepidosiren* from South America, and *Ceratodus* from Australia. On account of the lung-like structure of

the swim-bladder and its function as an organ of respiration, they are known as lung-fishes. Being the earliest vertebrates which are believed to have breathed air, the *Dipnoi* have an exceptional interest, and many zoologists consider them to have been the original stock from which the *Amphibia* and all other terrestrial vertebrates arose. Consult: Dean, 'Fishes, Living and Fossil.'

Dippel, Johann Conrad, yō'hän kōn'rād dīp'pēl, German mystic and alchemist: b. Frankenstein, near Darmstadt, 10 Aug. 1673; d. Berleburg, Prussia, 25 April 1734. He led a wandering life for many years, involved in difficulties political and theological, and he finally wrote a tract which appears to have ruined him with all parties, and to have provoked replies in the same spirit as that in which the attack had been made. He now fell in with some alchemical books, and at once threw himself into the search for the philosopher's stone. In this also he was assisted by others, who hoped to profit by the discovery, but when no result was obtained, and the money was not forthcoming, Dippel retired to Berlin, where he induced some persons of rank and wealth to help in the search. During his residence here he produced what is known as Dippel's Oil (q.v.), from which followed indirectly that of Prussian blue—an accidental discovery, it is true, but one of a class that could hardly have been made but for the constant and multifarious, though not well-directed labors, of such men as Dippel.

Dip'pel's Oil, the black fetid oil which was formerly produced by the distillation of stag's horn or ivory, and was used medicinally. Dippel, in the 17th century, refined it by washing with lime or potash, and rectifying the oil until it became limpid and aromatic. This rectified oil was the *oleum animale Dippelii* of the older pharmacopœias, which was prescribed in doses of a few drops as an antispasmodic and diaphoretic, and as a hypnotic.

Dipper, a name given to the seven stars in the constellation of the Great Bear, from their being arranged in the form of a dipper, or ladle.

Dipper, a water-ousel. See OUZEL.

Dipping-needle, or **Inclination Compass**, an instrument for measuring the magnetic dip or inclination; that is, the angle which a magnetized needle, free to move in the plane of the magnetic meridian, and about a horizontal axis, makes with the horizontal plane at the place. The dipping-needle is a light magnetized steel bar supported on a horizontal axis which passes, as nearly as possible, through the centre of inertia of the bar. The axis is either a steel knife-edge which rests on agate plates, or a fine wire supported by friction-rollers. A vertical circle surrounds the needle, the axis on which the needle turns being at the centre; the circle is graduated, and the needle moving over the graduations, the inclination to the horizon can be read off by means of it. The vertical circle is mounted on a vertical pillar, which turns round its own axis; and to the pillar there is attached at the foot an arm or pointer, which moves over a horizontal graduated circle. This last is supported on three legs furnished with leveling screws.

DIPROTODON — DIPTYCH

To observe with the dipping-needle the vertical circle must be placed in the plane of the magnetic meridian, and then the angle at which the needle is inclined must be read off by means of the graduations on the circle. The plane of the magnetic meridian might, of course, be determined by means of a separate instrument, such as the declination compass (q.v.). But this is not necessary, the vertical pillar and horizontal circle described above furnishing all that is required. A complete observation is made in the following way. The instrument having been properly leveled, the vertical circle is turned round on the pillar till the needle points vertically downward. When this is the case we know that the needle must be moving in the vertical plane at right angles to the plane of the magnetic meridian, because it is only in this plane that there is no horizontal component of force acting on the needle. The vertical circle is now turned round on the pillar through 90 degrees, which is done exactly by means of the horizontal circle at the foot. The needle is thus free to move in the plane of the magnetic meridian, and the inclination is read off.

Corrections for defects in the instrument must be applied in order to make the determination exact. In the first place, in order to correct for any error in centering of the axis on which the needle turns, readings are taken at both ends of the needle. Next, because the magnetic axis of the needle may not coincide with the axis of the figure, the needle is turned over on its bearings, and fresh readings are taken. Thirdly, the axis on which the needle turns may not pass exactly through the centre of inertia of the needle. If this were the case the needle would not balance about the axis exactly, one or other end of it being the heavier. To do away with error from this source, after one set of readings have been taken, the needle is lifted from its bearings and remagnetized, the end that was formerly north being now made the south end. A complete new set of readings is taken. The mean of all these gives the true inclination. See DECLINATION NEEDLE; MAGNETISM, TERRESTRIAL.

Diprotodon, di-prō'tō-dōn, a huge extinct marsupial of the Pleistocene Period in Australia. Its nearest living relatives are the wombats and kangaroos, which it somewhat resembled in the character of the head. The animal was by far the largest of the marsupials, almost equaling a small elephant in size, and resembling the elephants in its rather long legs and short post-like feet. The structure of the foot-bones is very remarkable; the great toe is short and stout, the others reduced to small slender rudiments. Its remains have been found in great abundance in certain dried-up salt lakes (Lake Callibona, etc.) of the central Australian deserts.

Dip'sacus, the typical genus of the *Dipsacaceæ*. See TEASEL.

Dip'sas, a genus of tropical opisthoglyph serpents, mostly tree-snakes with greatly elongated bodies and protective coloration, which are usually nocturnal, and feed mainly upon lizards and birds and their eggs, though some species pursue mammals and other birds exclusively. Their posterior poison-fangs (see OPISTHOGLYPHA) are large, but they differ in venomous

ability, which is rarely deadly to a large animal. This and several allied genera form the colubrid sub-family Dipsadinae.

Dipsoma'nia. See ALCOHOLISM.

Dipsosaurus, dip-sō-sâ'rūs, a reptilian genus of the family *Iguanidæ* (plurodont lizards), whose habitat is confined to the warmer parts of the United States. The genus contains but one species, *D. dorsalis*, which is terrestrial in its habits. When alarmed, it raises its head and tail and glides swiftly to its burrow in the sand.

Dip'tera, an order of two-winged insects, of which the common housefly and bluebottle are familiar examples. They are characterized by a body with slight coriaceous coverings, a trunk open beneath, and containing a sucker composed of two, four, or six lancet-shaped elongated scales, two palpi, antennæ almost always composed of three joints, large eyes, an abdomen of four to seven distinct segments, tarsi with five joints, and two short clubbed appendages called *halteres* or balancers, which seem to be the rudiments of the posterior pair in four-winged insects, and are kept in continual motion. They all undergo a complete metamorphosis. They are found in the earth, the air, and the water, in all climates and in all localities. The far greater number live exclusively on the sap of flowers.

Diptera'ceæ, or **Dipterocarpeæ**, an important order of exogenous trees. They are found in India, and especially in the eastern islands of the Indian archipelago. There are about 8 genera and 48 species known. The trees belonging to this order are handsome and ornamental, and abound in resinous juice. When young, the *Dryobalanops camphora* yields, on incision, a pale yellow liquid, consisting of resin, and a volatile oil having a camphoraceous odor; when old, it furnishes a kind of crystalline camphor. Other species produce fragrant resins used in temples, also varnishes; while some of the commonest produce pitches, and valuable timber.

Dip'terus, a fossil fish occurring in the Devonian rocks, and belonging to the Dipnoi sub-class, family *Dipteridæ*, of which this is the typical genus. Its distinguishing character is the possession of double dorsal and caudal fins. An interesting fact connected with it is that it approaches nearer to the lung-fishes than do any of the present existing ganoids.

Diptych, dip'tik, a tablet consisting of two leaves, light boards, held together by a hinge. In the time of the Roman empire diptychs were much used in correspondence between friends; even when three boards or more were used the name diptych (*Sintoxos*, folded double) was generally retained instead of triptych, tesseraptych, etc. Diptychs figure largely in the history of the Church for several centuries, being tokens of intercommunion between the assemblies of the faithful throughout the world. The use of diptychs in the liturgical service was in full vogue in the middle of the 4th century and it must have commenced much earlier. It was continued in the Latin Church to the 12th century and in the Greek Church to the 15th. The Diptychs of the Living had inscribed on them the names of the pope, patriarchs, bishops then living and presiding over the faithful in their respective spheres; also the names of the clergy of the particular churches in which they were

kept; names also of benefactors of the churches, of the emperor, and the empress, etc. For all these the faithful offered their prayers. The Diptychs of the Dead contained usually the names which had once been written in the Diptychs of the Living. In the diptychs were also inscribed the names of the Virgin Mary, martyrs, and other saints. If any name, whether of the living or the dead, was erased from the diptychs of a church, that erasure signified that the person was regarded as out of the communion of the Church. The diptychs both of the living and dead were read from the *ambo* or pulpit to the congregation. Church calendars and martyrologies seem to have had their origin in the diptychs. In the Roman Missal, the marks of the diptychs are very evident. At the prayer, "Te igitur," the names of the reigning pope and the bishop of the diocese are mentioned. In other prayers of the Mass the diptychs are followed. Consult: Kraus, 'Real — Encyclopädie'; Benedict XIV., 'De Missa.'

Dipus. See **JERBOA**.

Dique, *dêk*, **Canal del**, Colombia, an "artificial arm" of the Magdalena River in the department of Bolívar. It is navigable by steamers, and is a means of communication between Cartagena and the interior of the republic. Its total length is about 74½ miles, and in its course it passes through several swamps and receives the waters of various conduits, reaching the coast south of Cartagena.

Diræ, *dî'rê*, or **Eumenides**. See **FURIES**.

Dirce, *dêr'sê*, in Greek legend, the second wife of Lycus, king of Thebes, who from jealousy imprisoned Antiope, whom Lycus had divorced in order to marry herself; but Jupiter set Antiope at liberty, when she soon gave birth to two sons, Amphion and Zethus. These latter having grown up, put Lycus to death, and attached Dirce to the tail of a wild horse, which dragged her over the rocks, on which she was dashed to pieces. The gods, pitying her misfortunes, changed her into a spring, which bears her name and flows near Thebes.

Dircks, **Henry**, English civil engineer: b. Liverpool 26 Aug. 1800; d. Brighton 17 Sept. 1873. He published: 'History of the Search for Self Motive Power' (1861); 'The Ghost as Produced in the Spectre Drama' (1863); etc.

Direct and Retrograde, terms which, when used in astronomy, have reference to the real or apparent motion of the planets. When the planet moves forward or appears so to move, from west to east, in accordance with the order of signs in the zodiac, the motion is said to be direct. When the motion appears contrary it is said to be retrograde.

Direct Taxes, those which in theory the bearer cannot transfer to others, by adding correspondent charges to goods or service; as distinguished from indirect, those on goods for sale, which will be added to their selling price. The former in current understanding include taxes on polls, property, incomes, and privileges — that is, fees and licenses for doing business, keeping pets, carriages, etc. But the Supreme Court of the United States, in the income-tax cases, decided that only taxes on polls and property are direct; which is law for this country. The theory at best does not quite

conform to facts. Taxes on real estate occupied by the owner, for example, are not transferable; but those on property for rent are so much added rent charge, and as indirect as customs duties. The heavy license fees charged by many municipalities for doing certain classes of business are *pro tanto* an increase of the business expense, and must be met in the charges if the business is to live; often, indeed, they are used openly as "protective," to give industries of one State an advantage over others — this is especially so with insurance companies. On the other hand, income taxes on salaries cannot in practice be transferred, as an employer will not raise salaries on account of his employees' taxes; while those on mercantile incomes are in the same category as those on licenses, and can to some extent be recouped from customers. All State and municipal revenues in the United States are raised from direct taxes in the broader sense; the Constitution prohibits them from laying duties on exports or imports, but not on internal manufactures, which, however, are also left entirely to the general government. The latter restricts itself to customs and excises. Only five times in its history has it resorted to direct taxation, in the narrower sense above: in 1798, 1813, 1815, and 1816, on real estate and slaves; and in August 1861 a levy of \$20,000,000 for war expenses was laid on all house lots with dwellings and improvements. The operation of the act was suspended 1 July 1862, when \$15,000,000 had been collected; and the act of 2 March 1891 refunded it to the States.

Directors, the persons authorized to manage and direct the affairs and business of a corporation or company. The directors are sometimes called managers or trustees, in accordance with the purpose and nature for which the corporation or company was formed. At the present time, nearly if not all, corporations are formed under general laws and it depends on the law under which the corporation is created as to the number of directors and their qualifications. The general qualification is that all directors must be stockholders in the corporation or, if it has no stock, they must be members of the corporation. The directors are generally elected by the stockholders, and some States have passed laws allowing cumulative voting, by which each stockholder may multiply the number of his shares by the number of directors to be elected, and cast all his votes for one director or distribute them in any manner he desires. It has been held that this kind of a law is unconstitutional, if applied to corporations created before the law was passed; as it impairs the obligation of the contract. It may be valid, if applied only to corporations created after the passage of the act. In some cases directors are appointed. The directors must act as a body and not as individuals. A majority of the board of directors is necessary to a legal meeting and if that number is present a majority of those present will be sufficient to perform any act. When there is a quorum present, all acts performed are presumed to be done in the regular course of business. The directors for the purpose of the business of the corporation are held to be the corporation itself; and their powers and duties depend on the laws under which the corporation is formed and the charter and by-laws

DIRECTORY

of the corporation. Notice to the board of directors during a meeting of any matter in which they are required to act is notice to the corporation.

The directors are considered as general agents of the corporation, and they are the only ones that can manage the business of the corporation; although the directors are generally elected by the stockholders they are responsible to the corporation and through the corporation to the stockholders. As the directors derive their power from the charter their acts are of no effect if they are outside of the delegated power; and all acts performed by the directors which are outside of their power must be passed upon by the stockholders.

While directors are sometimes called trustees, they are not held to the same strict accountability as an ordinary and regular trustee; although their position is a fiduciary one. The directors may deal with the corporation the same as any other individual; but they cannot use their position for any special benefit to themselves. They may even go so far as to buy up the indebtedness of the corporation and at a sale buy in and acquire the absolute title to the corporate property. The directors may delegate their power to an agent, as a private individual may do, and the agent's power is not impliedly revoked by a change of the members of the board, as the act of appointment is not that of the directors individually but of the board. The directors have a discretionary power and when it is honestly exercised there is no one that can make them account for their acts. A frequent illustration of this power is in relation to suit by or against the corporation, as to whether they shall be brought or defended. If a director's individual interests are in conflict with the interests of the corporation the act must be fair and just to the corporation.

Directory, a compilation of the names and addresses of the persons in a city, or in a special line of trade, or the like. The first directory of the city of London was issued in 1677, under the title 'A Collection of the Names of Merchants,' and the first New York directory in 1786, the latter containing less than 1,000 names. The London directory of 1732 is believed to be the first which bore the title "directory." Every American city of moderate size now has its directory, and many directories of towns and counties are issued. There are also a few State directories, and a great number of business directories, arranged according to the needs of the respective localities. Directories of firms in each of the leading lines of trade are issued regularly, often in connection with some sort of commercial rating. Directories of people in society are commonly termed blue books. Telephone companies also issue directories of their subscribers.

City directories constitute the most important class of these publications, and are commonly issued by private enterprise. The concern that issues the first directory of a town or city, and continues to issue the same at regular intervals, usually yearly, soon establishes a sort of franchise, which enables them to control that field as long as they issue a satisfactory book. There are a number of firms in the United States whose sole business is publishing directories, and they have acquired

territory by being the first in their respective fields. As a rule they do not compete with each other in the same territory, for even in very large cities a second directory rarely pays.

The gathering of names and addresses for a directory, when rightly done, is an expensive matter, involving a house-to-house canvass of the entire territory, within a short space of time. Sometimes the work is cheapened by the copying of assessors' lists or lists of voters, but the great majority of directory publishers find that the best way is to make their own canvasses yearly. To protect themselves against the competition of firms that might simply copy the book and thus compete with them at a much reduced cost, all experienced directory publishers now insert a number of bogus names and addresses in their books, which are copyrighted. While a competitor would have a right to issue another correct, and therefore very similar, book without infringing the copyright, the fact that he copies these bogus names is direct evidence of infringement, calculated to result in a judgment of damages to the injured party.

The mere placing of names in alphabetical order for a directory seems a simple matter, yet in reality it involves considerable care and judgment. Take the names "McNeil" and "MacNeil" for instance. If they are separated, a person searching in the directory under one spelling might miss the other altogether. As it is generally understood that "Mc" is simply an abbreviation of "Mac," the directories now commonly begin the lists of M's with the "Mcs," which ever way they are spelled, allowing such names as "Madison" and "Magee" to appear farther on. The location of such names as begin with figures also calls for discretion, as when it is desired to insert "1st Ward Republican Club." Such an entry is usually put in the f's, even if "1st" is the authorized way of spelling it.

The profit in directories is mainly in the advertising, and few of them would be issued simply for the sake of the sale. The number of firms that buy them is naturally limited to successful business concerns whose business requires frequent reference to a directory. Drug stores habitually carry copies on their counters for the benefit of the public, and many banks and newspaper offices have copies in their offices placed conveniently for the use of customers.

The advertising in the directory of a large city commands a high price, and yields large returns. It is customary to place the advertising on the margins of the leaves of the directory, and almost all over the cover, as well as the edges of the book. No available spot is considered sacred from such intrusion, as is the case with most newspapers and magazines. Any man or firm that will pay for it can have his or their name inserted in as big type as desired, or secure conspicuousness in any other way that ingenuity can suggest.

At the present time the directory field of industry in the United States appears to be rather crowded, and many directories are published not for immediate profit, but simply to hold a field until it shall grow large enough to be profitable. A few years since an association of directory publishers was formed, which holds annual meetings, and endeavors to check unwise competition, and to conserve the interests of the trade as a whole.

DIRECTORY — DISCIPLE

Directory, in French history, the executive body established by the constitution of the French republic in 1795. (Fr. *directoire*.) This body consisted of five members, called directors (*directeurs*) who were chosen by the Council of Elders from candidates presented by the Council of Five Hundred. Each director was president for three months in rotation, and one was compelled to make room for a new member every year. The unpopularity of the directory's home policy was increased in 1799 by the disastrous results of its war policy, and it was easily overthrown by the *coup d'état* of Napoleon and his brother Lucien, 9 Nov. 1799. See FRANCE.

Directrix (Lat. *linea directrix*, "a directing line"), in mathematics, a line governing the direction of another line. If a point so move that its distance from a given fixed point is to its perpendicular distance from a fixed straight line in a constant ratio, it describes a conic section, of which the fixed straight line is termed the directrix, and the fixed point the focus. The constant ratio referred to is termed the eccentricity, and its magnitude determines the nature of the conic. Thus, if in the figure AB be the directrix and F the focus, if the point P move so that its distance from F is to its distance PM from AB in a constant ratio, then P will trace out a conic section, which will be an ellipse, parabola, or hyperbola, according as the ratio in question is less than, equal to, or greater than unity—that is, as FP is less than, equal to, or greater than PM, or FV than VI. A quadric surface has a directrix with analogous relations. The fixed lines on which rests the line whose motion, right or curved, generates a surface, are called directrices, or directing lines.

Dirhem, *dér'am*, or **Dramm**, a modification of the Greek *drachma*, the name under the caliphs for a weight of silver equivalent to about 45 grains, and was also used for precious stones and medicine in Arabia, Persia, Egypt, and Turkey. As a coin the value varied, but may be given at 11 cents under the caliphs. In Turkey, the name dirhem has lately been given to the much smaller weight, the French gramme.

Dirk, a kind of dagger formerly carried sheathed between skin and stocking as a weapon by the Highlanders of Scotland. Dirks are worn by midshipmen and cadets of the British navy. See DAGGER.

Dirk-Hartog (*dérk-här'tög*) **Island**, an island on the west coast of western Australia, at one of the entrances to Shark Bay, which it partly encloses; area, about 450 square miles. It forms a plateau with good pastures and plenty of water. The pearl oyster and edible oysters are here in great abundance.

Dirschau, *dér'show*, Prussia, city, about 19 miles southeast of Danzig, on the Vistula. The city has railroad and machine shops, and large sugar works. Pop. 12,000.

Dirt-eating. See GEOPHAGISM.

Dis (also **Orcus** and **Tartarus**), in Roman mythology the name given to Pluto, the Greek

god of the lower regions. The word *dis* is akin to *divus*, and originally denoted merely godhead.

Disability, in law, when absolute disables the party from holding public office or doing any legal act, and is usually the result of murder, outlawry, or any outrage upon person or property. Aliens, infirm and aged persons, dependent on public charity, are under this ban of incapacity, and in most Catholic countries those individuals who have been excommunicated. There is a disability termed partial that covers infancy, minority, lunacy, and drunkenness. Also a term in accident insurance policies which, on account of inability to work or perform natural duties resultant from injuries, provides payment for the afflicted party. See ATTAINDER.

Disassociation. See DISSOCIATION.

Disbar'ment, the expulsion of an attorney, counselor, or advocate from practice at the bar, this act depriving him of the privileges of his profession. A lawyer suffers this penalty if adjudged guilty of any misconduct of grave nature, as gross contempt of court, bribery, etc. The courts alone have this power of dealing with a man. Before disbarring him the accused is given every opportunity to refute the charge, being allowed to defend himself in open court. A lawyer so dealt with may, at the discretion of the authorities, be restored when sufficient proof is brought them that there is no likelihood of a future offense.

Discharge, in architecture, the relieving part of a wall, or a beam or other piece of timber, from the superincumbent weight by means of an arch thrown over it. In hydraulics, the issuing direction of water from a reaction or turbine wheel; as the outward discharge, or Fourneyron turbine; the vertical discharge, or Jonval turbine; the centre discharge, etc. In bankruptcy, a writing or document certifying that a bankrupt has satisfactorily passed the necessary forms, and is thereby discharged from all further responsibility for the debts contracted by him previous to his bankruptcy. In the military and naval services, a document given to each soldier or sailor on his dismissal from or quitting the service, in which are detailed full particulars as to his length of service, conduct, reason for discharge, etc. In electricity it signifies the removal of the charge by communication between the positive and negative surfaces or poles, or with the earth.

In dyeing, a substance such as chloride of lime or nitric acid, used by calico-printers to remove a color. Suppose a white pattern is to be produced on a uniformly colored ground. The cloth is first dyed, and then the pattern is printed with an acid, such as the tartaric, thickened with gum. When passed through a dilute solution of bleaching-powder, the acid decomposes it, and the liberated chlorine destroys the color at the parts where the pattern was printed. Sometimes the cloth is prepared at the same time for subsequent pigment printing.

Disciple, literally, one who learns anything from another; and hence, the followers of any teacher, philosopher, or head of a sect. In this sense the word is sometimes used in Scripture, as when we read of the disciples of Moses, of John, of Christ. Generally, however, it is used with reference to the last of these—the followers of Jesus. Sometimes all who re-

DISCIPLES OF CHRIST

ceived the doctrines of Christ are called disciples, but in a more limited sense, it is applied to the 70, or 72, persons who were his more immediate followers and attendants. Sometimes it is used as synonymous with apostle, and is applied to the Twelve.

Disciples of Christ. The religious movement, whose representatives have come to be known as Disciples of Christ, or Christians, may be said to date its origin from the 'Declaration and Address' issued by Thomas Campbell, September 1809, and endorsed by his son, Alexander Campbell, who later became the leader of the movement. Thomas Campbell migrated from the northern part of Ireland in 1807, to seek a home for himself and his family in the New World. He located near Washington in western Pennsylvania. He was related by blood to the poet, Thomas Campbell, and was a man of learning and profound piety. Being a minister in the Seceders' branch of the Presbyterian Church, he entered upon his labors in connection with that denomination immediately upon his arrival in this country. His experiences in seeking to assemble the scattered people of God of different names and creeds, and to instruct them in spiritual things, led him to realize more fully the evils of divisions among Christians. In his efforts to promote greater unity and co-operation among the members of these different sects, he found himself in conflict with the ecclesiastical authority under which he was working and was brought to trial before his presbytery, which censured him for his course. Mr. Campbell soon withdrew from the ecclesiastical authority under which he had been preaching, but continued his ministry to an increasing number of people in private dwellings and wherever else an audience could be gathered.

In the 'Declaration and Address' referred to it was declared that "the Church of Christ upon earth is essentially, intentionally, and constitutionally one, consisting of all those in every place that profess their faith in Christ and obedience to Him in all things according to the Scriptures, and that manifest the same by their temper and conduct; and of none else, as none else can be truly and properly called Christians." While admitting the necessity of "distinct societies, locally separate one from another," this new declaration of independence declared that "there ought to be no schisms, no uncharitable divisions among them. They ought to receive each other as Jesus Christ also received them, to the glory of God, and for this purpose they ought all to walk by the same rule; to mind and speak the same things, and to be perfectly joined together in the same mind and in the same judgment." The address adds that "in order to do this, nothing ought to be inculcated upon Christians as articles of faith, nor required of them as terms of communion, but what is expressly taught and enjoined upon them in the Word of God. Nor ought anything to be admitted as of divine obligation in their church constitution and management but what is expressly enjoined by the authority of our Lord Jesus Christ and his apostles upon the New Testament Church, either in express terms or by an approved precedent."

In a word, the new movement had for its aim no less an object than the unity of Christians as they were one in the apostolic Church. In order to realize this consummation in harmony

with the Lord's intercessory prayer they decided to reject all party names for those given in the New Testament, and all human creeds or formulas as authoritative or binding on the human conscience, or as bases of fellowship, and to take the word of God alone as their rule of faith and practice, and especially the New Testament, which was given for the guidance and instruction of Christians in their new life in Christ. Believing it to be necessary to return to the original foundation and practice of the Church in order to realize its unity and its power, they made a fresh study of the New Testament to ascertain (1) what was the essential creed or confession of faith required in the early Church; (2) on what conditions persons were received into its membership; and (3) what was the nature of their organization and government. They reached the conclusion that the confession of faith made by Simon Peter, on which Jesus declared he would build his Church, namely "Thou art the Christ the Son of the living God," was the creed of Christianity and the essential faith, and that all those who would make this confession from the heart, being penitent of their past sins, were to be admitted by baptism into the membership of the Church; that baptism in the early Church consisted of the burial of a penitent believer in water in the name of the Father, and of the Son, and of the Holy Spirit, and that only such were fit subjects for baptism; that the form of Church government was congregational; that each congregation had its deacons and elders or bishops, the former to look after the temporal, and the latter the spiritual interests of the Church. The Lord's Supper, it was found, was observed at first daily perhaps, but later weekly, on the first day of the week, in remembrance of Christ's suffering and death. Hence they practice weekly communion.

With this plea for the New Testament basis of fellowship, and a return to the original purity and simplicity of the gospel and Church organization, the Disciples have made a marvelously rapid increase. The movement at present has reached a numerical strength of 1,250,000, having its colleges, its religious journals, and its missionary, educational, and benevolent organizations, all of which are doing effective work. The American Christian Missionary Society is the national organization for home missions. The Foreign Christian Missionary Society, as its name indicates, has for its object the evangelization of the world. Besides this the Christian Woman's Board of Missions is an organization of the Christian women, which is doing mission work in both the home and foreign fields.

The Disciples of Christ raised over \$600,000 for missionary purposes in 1902, while contributing a grand total of over \$6,000,000 for all religious purposes in that year. They are supporting missions in India, China, Japan, Africa, the Philippines, Cuba, Porto Rico, Mexico, Scandinavia, and Turkey. Their aim is to be evangelical without being sectarian, and to be liberal without being latitudinarian. They attribute their success to their advocacy of Christian union, the simplicity and directness of their preaching and the freedom which they enjoy, untrammelled by human creeds or by any hierarchical authority.

DISCIPLES OF CHRIST — DISCOBOLUS

The following statistics are taken from the annual official report for 1902:

No. Churches.....	1902
No. Communicants.....	10,957
No. Bible Schools (Sunday Schools).....	1,207,377
No. Scholars, Officers and Teachers.....	8,271
No. Ministers.....	796,699
	6,477

MISSIONARY.

Foreign Christian Missionary Society.....	\$178,324
Christian Woman's Board of Missions.....	139,034
American Christian Missionary Society.....	82,931
Board of Church Extension.....	54,866
State and District Missions.....	154,059
Miscellaneous Missions.....	15,000—\$ 624,214

EDUCATION AND BENEVOLENCE.

Buildings and Endowments of Schools.....	\$175,000
Homes for Orphans, the Aged, etc.....	72,332
Ministerial Relief.....	7,421—\$ 254,753

LOCAL CHURCH WORK.

Ministerial Support.....	\$3,665,000
Incidental Church Expenses.....	760,000
Church Buildings.....	550,000
Church and Bible School Literature.....	340,000—\$5,315,000
Total from all sources.....	\$6,193,967

Editor The Christian-Evangelist.

Disciples of Christ. See CHRIST, DISCIPLES OF.

Disciplī'na Arca'ni, the modern name of an ancient usage of the Christian Church in withholding from pagans, and even from catechumens during their preparation for admission to baptism, the knowledge of certain of the Church's doctrines. The existence of this rule of silence in the Church in the 4th century is shown by the Catecheses of St. Cyril (q.v.) of Jerusalem, where the lectures on the sacrament of the Eucharist are deferred till after the catechumen had been baptized. He was then made acquainted with the *catechesis mystagogica*, or mystic catechism. Sometimes in that age when the sacred mysteries had to be referred to in a mixed assembly of believers and pagans, or in writings addressed to pagans, the fathers would use forms of speech quite unintelligible to the uninitiated, adding, "the believers will understand." On one occasion St. Epiphanius alluded to the sacramental words of institution of the Eucharist, "This is my body" in this cryptic fashion, saying instead of τοῦτό ἐστιν τὸ σῶμα μου, τοῦτό μου ἐστι τὸδε. And St. John Chrysostom writing to Pope Innocentius about the profanation of the Sacrament on a certain occasion, writes plainly: "The most holy blood of Christ was spilled upon the clothes of those soldiers." But Palladius, in his life of Chrysostom, uses a cryptic form of language to denote the same occurrence; his words are: "They spilled the *symbola*." St. Paul is quoted as enjoining a like reticence where he writes to the Corinthians that he fed them with milk, not with strong meat, because they were not able to bear it. Testimonies of the ancient fathers concerning the existence in their times of the *disciplina arcani* are numerous and, says Newman, "that it existed even as a rule with respect to the Sacraments, seems to be confessed on all hands."

Discipline, in military and naval affairs, the general term applied to the prescription and enforcement of statutes, rules of procedure, orders, and regulations governing officers and men

in service. Regimental discipline is chiefly maintained by the adjutant. He inspects and tells off all guards, escorts, and parties; keeps the regimental books; receives all garrison orders; superintends the drill and field movements, etc. In matters of discipline the adjutant-general is to the whole army what the adjutant is to a regiment.

Discipline, Books of, two books connected with the Scottish Church. The First Book of Discipline was drawn up by John Knox and four other ministers, and laid before the General Assembly in 1560. It was also submitted to the privy council; and though not formally ratified by them, it was subscribed by the greater part of the members. A similar document, called the 'Second Book of Discipline,' was prepared and sanctioned by the General Assembly of 1578; and from that time it has been recognized as the authorized standard of the Church of Scotland in respect of government and discipline. It lays down principles regarding the relations of Church and state; defines the provinces, duties, and relations of church-officers, the mode of their election, etc., and states the operation of the Presbyterian polity in the General Assembly, synods, and presbyteries of the Church of Scotland.

Discipline, Ecclesiastical, the control and correction which ecclesiastical bodies claim the right to exercise and administer for the purpose of maintaining correctness of living, and soundness of belief among their members. The only form of discipline at present exercised over contumacious lay members of a religious body consists of excommunication, or exclusion from a share in the ministrations and offices of the Church. The clergy, on the other hand, are liable to suspension or deposition; the former a temporary, the latter a perpetual, deprivation of office and authority. For methods by which the civil power was authorized by the Church during the Middle Ages to discipline heretics or notorious evil doers, see INQUISITION.

Disclaimer, in equity, a plea put in on the part of a defendant in which he disclaimed all right or title to the matter in demand by the plaintiff's bill. In patent law, disclaimer is the renunciation or relinquishment of all claim to patent rights in an invention. The term is also applied to the refusal to accept a gift or devise of land or other property, and generally to the waiving of any claim.

Dis'co, an island on the west coast of Greenland, under the parallel of 70° N. It is mountainous, reaching a height of 3,000 feet; about 90 miles in length; and contains much excellent coal. The harbor of Godhavn is on the south coast.

Discob'oli, Cuvier's name for the lump-suckers (*Cyclopterus*), beside which he placed the *Remora* (q.v.). The term is still used for the family to which the lump-sucker (q.v.) belongs.

Discob'olus, (1) in classical antiquity, a thrower of a discus, or quoit; a quoit-player; specifically, the name given to the famous Greek statue of the quoit-thrower, preserved among the Townley Marbles in the British Museum. (See DISCUS). (2) In ichthyology a name given by Cuvier to his third family of soft-finned teleostean fishes, having the ventral fins under the

pectoral. The name is derived from the ventral fins forming a disk on the under surface of the body, by which the fishes are enabled to catch hold on the points of rocks.

Dis''comedu'sæ. See JELLYFISH.

Discoph'ora. See HIRUDINEA; LEECH.

Discord (Latin *discors*, inharmonious), in music, is a combination of sounds producing irregular vibrations and technically called cacophony. It is a direct violation of harmonic laws and frequently spoken of as nothing but downright noise. Often confused with dissonance (q.v.) which, however disagreeable the effect it has upon a hearer, obeys certain grammatical rules in the science of music, though never consonant. Celebrated composers have used discords purposely in their compositions requiring *macabre* character. Berlioz in his 'Damnation of Faust' is a case in point, while Wagner's scores bristle with cacophonies and dissonances.

Discount (O. F. *discontes*, to count off), a deduction made from a quoted price, in consideration of a cash payment. Discount is also the amount deducted from the face value of a bill of exchange or promissory note, as the price for cashing it to the payee so many months or weeks before it is payable by the person who is primarily responsible for its payment. Bank discount is simple interest on the face value of a promissory note, and deducted from the face value, instead of being reckoned on the amount advanced. True discount is such an amount deducted, as would be simple interest on the amount advanced, for the time specified in the note.

Discoveries of America to 1542, Spanish and Portuguese: John Fiske writes: "Properly regarded, the discovery of America was not a single event, but a very gradual process. It was not like a case of special creation, for it was a case of evolution, and the voyage of 1492 was simply the most decisive and epoch-marking incident in that evolution."

Half of a century was occupied in the principal Spanish and Portuguese discoveries which, being followed by colonization, gave to those nations their vast possessions in the western hemisphere. In 1492 Columbus landed on Watling Island, which the natives called Guanahani, and which he named San Salvador, 12 October (see BAHAMAS); discovered Cuba 28 October; Hispaniola, now called Haiti or Santo Domingo, 6 December; thought Haiti must be Japan, and Cuba the Asiatic mainland; deserted by Martin Pinzon with the *Pinta*, and his flagship the *Santa Maria* having been wrecked, he returned to Spain in the *Niña*, arriving at Palos 15 March 1493. In 1493, seven weeks after the return of Columbus, Pope Alexander VI. assigned undiscovered lands, etc., west of a certain line to Spain, and east of the same line to Portugal (see DEMARCATION, LINE OF); on 25 September Columbus sailed from Cadiz, his second voyage bringing him in sight of the island of Dominica, 3 November; Guadeloupe and Marie Galante were discovered 4 November; Antigua 10 November; Porto Rico later in November, and the town of Isabela was founded on the northern shore of Hispaniola in December. The ruins of Isabela, the first town established by Europeans in America, are to be seen about 25 miles west of

Puerto Plata. In 1494 Columbus discovered Jamaica, 3 May; the Isle of Pines 13 June. In 1497 Vicente Yañez Pinzon, Solis, Amerigo Vespucci, and others sailed from Cadiz, 10 May; probably their first landfall was the coast of Honduras, whence they followed the coast of Mexico and the United States, rounding Florida, and proceeding up the Atlantic coast to "the finest harbor in the world," conjectured to be the Chesapeake Bay; returning to Spain by way of the Bermudas, and reaching home 15 Oct. 1498. In 1498 the third expedition of Columbus started on 30 May from the Spanish port of San Lucas de Barrameda; discovered Trinidad 31 July; Columbus caught a glimpse of the land at the delta of the Orinoco, and called it *Isla Santa*, or Holy Island, 1 August, but after passing the mouth of the Orinoco reasoned that so vast a stream of running water could be produced only upon a continent; went westward to Cubagua. In 1499 Vespucci, with Ojeda and La Cosa, followed the northern coast of South America for a long distance, seeing a part of the coast of Brazil, the Guianas, and Venezuela, and proceeding west of Cubagua as far as the Gulf of Maracaibo and Cape de la Vela. In 1500 Vicente Yañez Pinzon (who had sailed for Spain in December 1499) struck the Brazilian coast near the site of Pernambuco, 20 January, and discovered the Amazon 26 January; Diego de Lepe, between January and June, followed the Brazilian coast to latitude 10° S. approximately. Cabral landed on the Brazilian coast, which he explored from about 12° to 16° 30' S., taking possession in the name of the king of Portugal (see BRAZIL); Bastidas, La Cosa, Balboa, and others (see CENTRAL AMERICA), sailing in October, explored westward from Cape de la Vela to the Gulf of Urabá, and beyond that to Puerto Bello on the Isthmus, the voyage ending September 1502; Gaspar and Miguel Cortereal made voyages to Labrador in the interests of Portugal (1500-1-2), but the coasts visited were mainly within the region previously explored by the Cabots. In 1501 Vespucci sailed for the Brazilian coast, 14 May, his voyage ending 7 Sept. 1502; he explored the Atlantic coast of South America from 5° S. to 34° S., and sailed thence to South Georgia Island, 54° S. In 1502 Columbus set out on his fourth voyage, 11 May; discovered Martinique 13 June; during the latter part of that year and the earlier part of 1503 he carefully studied the coast between the gulfs of Honduras and Darien, especially that of the narrowest part of the Isthmus (see CENTRAL AMERICA). In 1503 and 1504 Coelho and Vespucci sailed along the coast of Brazil, the former to about 40° S., the latter to about 23° S.; Jaques explored the Brazilian and Patagonian coasts to about 52° S. In 1505 and 1507 Vespucci, La Cosa, and others explored the Atrato River and the Darien region. In 1508 Cuba was circumnavigated by Ocampo, and thus first known to be an island; during a voyage extending from 29 June 1508 to October 1509, Solis and Pinzon explored the Brazilian coast to about 40° S. In 1512 and the following years explorations of the interior of Colombia, etc. (see DABIBA), were undertaken in the hope of finding an Eldorado. In 1513 Balboa (q.v.) discovered the Pacific; Ponce de Leon in March discovered some of the Bahamas, and on Easter Sunday, 8 April, landed on the coast of

Florida. In 1516 Solis, searching for a strait at La Plata River, was killed by the natives. In 1517 Córdova explored the coasts of Yucatan. In 1518 Grijalva explored the Mexican coast, gulf, etc. In 1519 Cortés discovered and began conquest of the Mexican uplands of the interior. In 1520 Magellan discovered the straits which bear his name, 21 October; entered the southern Pacific Ocean 28 November. In 1524 the first (unsuccessful) expedition sailed from Panama bound for Peru. In 1527 Narvaez led an expedition to the upper Gulf of California. In 1531-33 a part of the empire of the Incas (see Cuzco; PERU) was explored and conquered by Francisco Pizarro and others. In 1535 Grijalva discovered California; Diego de Almagro led a force into Chile, but was compelled to withdraw. In 1540 Pedro de Valdivia set out from Peru to succeed where Almagro had failed. In 1541 Francisco de Orellana descended the Amazon from Peru. In 1542 Gonzalo Pizarro returned to Quito from the exploration of the heart of the South American continent; and about the same time De Soto died in the Mississippi valley, having discovered the great river of the North American continent.

MARRION WILCOX,
Authority on Latin-America.

Discovery, in law, the act of a litigant who is called on to reveal or make known any matter or document which will aid in enforcing a right or repelling an unjust demand.

Discovery, The, a ship noted in the history of exploration, as the vessel built by the East India Company in 1602 to determine the whereabouts of the northwest passage. She was originally commanded by Capt. George Weymouth, who sailed with a consort from Greenland, 2 May 1602. In 1610 Henry Hudson discovered the Hudson Bay in the same vessel, spending the succeeding winter in the ice. In 1611 the crew mutinied and set Hudson and some of his companions adrift, never again to be heard of. Later she was commanded by Sir Thomas Button (q.v.) who discovered Nelson's River and other points. In 1615 and 1616, the *Discovery* sailed with Baffin (q.v.) and Bylot, making important discoveries and explorations. In 1875-6 the name was borne by a steam vessel, one of the two in Nares' expedition.

Discovery of America. See AMERICA; NORSEMAN.

Discus, among the Greeks and Romans a quoit of stone or metal, from 10 to 12 inches in diameter, convex on both its sides, sometimes perforated in the middle. The players aimed at no mark, but simply tried to throw the quoit to the greatest possible distance. It was sometimes furnished with a thong of leather to assist in the throwing. The throwing of the discus was a notable feature of the revival of the Olympian Games at Athens in 1896. In these games the discus-throwing event was won by Robert Garrett of Princeton University, who far outclassed all the foreign competitors. The world's record in 1900 was 118 feet 9 inches, held by C. Henneman, an American. See DISCOBOLUS; QUOITS.

Disease, a term which refers to any morbid deviation from normal health—as disease of mind or body—and refers specifically to a group of morbid conditions which may affect the

same part of the body and exhibit similar symptoms, such as disease of the lungs, disease of the brain, Bright's disease, that disease of the arteries which causes a hardening of the muscular elastic coat, and which is called arteriosclerosis, disease of the mind (Jastrow). Such a definition posits the knowledge of what is normal, and this is often a very difficult position to understand. Thoma has suggested as an empirical definition of disease a deviation from the normal in its anatomical or chemical structure, or in the functions of the body, its organs and elements of organs, which exceeds the limits of individual physiological variation. This definition, the author himself admits, gives no explanation of the nature of the processes. It does no more than to give the criteria for deciding when any condition is to be called pathological. That is, it may readily be seen that any definition of disease from a general standpoint must necessarily take into consideration what normal physiological variations may be, and it is now acknowledged that no hard and fast lines can be drawn between normal and pathological processes. Barker has well said: "The activities of cells are subject to certain definite laws, which hold in diseased conditions of the body as well as in health. When the structure or function of the organism differs markedly from a normal standard for the species, the reason lies either in abnormality in the inherent activities in some or all of the cells of the body or in the abnormal nature of the environmental influences to which some or all of the cells are exposed, or in both. In any of these cases, morbid instead of normal reactions are encountered. In the first instance, environmental influences, normal for healthy individuals, would call forth morbid reactions; in the second instance, individuals previously healthy would become diseased through environmental influences which are incompatible with the maintenance of health because outside the ordinary deviations from the average; and in the third instance the two conditions would be combined. Properly speaking the science that studies diseased or abnormal conditions is called pathology, but because of the extension of the science it is divided into several departments. Thus one distinguishes general pathology from descriptive pathology. General pathology stands with reference to special pathology in the relationship that philosophy occupies with reference to the individual sciences. It is the synthesis of the forms which special pathology affords. It endeavors to find out the laws that govern disease in general, searches for the causes of disease, discovers the order of events in diseased conditions, and groups the symptoms and lesions common to whole series of special pathological processes. Commonly it is popular to speak of diseases as organic and functional; organic diseases having attached to them definite structural changes in the organs affected; functional diseases being understood as diseases in which no such structural changes are demonstrable. This is a purely artificial distinction, however, and on close analysis cannot be maintained. Diseases are classified in general for purposes of general inquiry, particularly as to the statistical studies for economic purposes such as are involved in tabulation of cases of death, by health boards, for hospital returns, and for medical departments in the army and navy. These classifications are of great importance for the gathering

DISEASES

of much useful information, but they are naturally subject to much change, as new discoveries ally certain heretofore apparently unrelated diseases under common heads. Consult Hektoen, 'American Text-book of Pathology.'

Diseases, Germ Theory of. As a speculation, the germ theory of disease is centuries old; as demonstrable in fact, however, it is a thing of but yesterday. Aristotle in the second century believed that certain diseases were due to microscopical organisms, although he and many others who believed the same could not prove it, but it was reserved for Pasteur, Koch, and other modern students of the young science of bacteriology to demonstrate beyond doubt that certain disease processes result from the invasion of the human body, as well as those of animals and plants, by certain forms of lowly organized plant and animal life, and that the disturbance in the healthy functions of these animals and plants is an indication of the battle taking place between the living animal or plant cells and their animal or plant parasites.

In the early days of the germ theory of disease, it was thought that only plants such as molds and bacteria could give rise to disease, but it has been further demonstrated within recent years that there are a large number of lowly organized animals which might obtain an entrance into the body and there cause disease. Historically it is of interest to note that one of the first diseases definitely proven to be associated with bacteria was a certain disease of silkworms. This was studied by Pasteur, and opened the way to subsequent discoveries of modern bacteriologists, so that at the present time it is clearly proved that such affections as diphtheria, tuberculosis, typhoid fever, pneumonia, cholera, tetanus, anthrax, relapsing fever, influenza, erysipelas, rheumatism, the plague, glanders, and actinomycosis, are due to definite bacteria, while malaria, certain forms of dysentery, certain forms of abscess of the liver, and some skin diseases are known to be caused by low forms of animal life, the protozoa; and still higher in the animal kingdom it is known that certain parasitic worms give rise to definite forms of disease, some of these being known as distomiasis, ascariasis, trichinariasis, uncinariasis, filariasis. In addition to these the ordinary tapeworms may be mentioned. With reference to the bacterial agents that cause disease, in the article on bacteria (q.v.) it was pointed out that there were a great many forms of these plants and that only a few of these were known as pathogenic, or as disease-producing. This term pathogenic, however, is purely a relative one, because under certain circumstances the introduction of well-known pathogenic micro-organisms in the human body may be harmless. In the study of the pathogenic effects of any given bacterium both the micro-organism and the animal host should be taken into consideration, because any resulting disease is a product of some detail of the characters of the infecting agent on the one hand and of the subject of the infection on the other. There may be many modifying circumstances, involving each of these factors. Thus as regards the character of the particular species of bacterium that may enter the body, its effect will depend chiefly upon its inherent virulence, the number that may be introduced into the body at one

time, and the path through which the infection takes place. Thus the virulence (meaning largely the power of multiplying) of many micro-organisms in the body varies greatly under different conditions. With reference to the number: The healthy tissues can resist the certain number of pathogenic micro-organisms of given virulence, but if a larger number are introduced it may be that the animal will succumb. This is a fact demonstrated to be true for tuberculosis in high degree. The path of infection is of much importance, for if virulent micro-organisms are thrown directly into the blood-stream, and can thus traverse the entire body looking for a favorable nidus or growth, the chances are much against the organism. With reference to the subject of infection: The species of the animal, his race peculiarities, and his age are all important items. Thus it is known that tuberculosis among the Indians is extremely fatal; whooping-cough, when first introduced into New Zealand, was almost universally fatal; children are susceptible to infectious diseases which the adult escapes; local diminished vitality plays a very important role in the production of disease in many individuals. See IMMUNITY.

As to the modes of bacterial action, two main factors are known to be involved; one concerns the ability of the bacteria to multiply in the animal body after they have once entered, and the other, the production of poisons by them that may act upon the tissues. The former process is known as the infection, the latter as the intoxication. Thus in the discussion of the germ theory of disease, it is understood here that the disease process as seen in the individual is nothing more or less than an evidence of the struggle that takes place between the protective agencies of the body on the one hand and similar self-assertive processes taking place in the bacterial body, for it can hardly be denied that rapid multiplication and the production of poisons are the means employed by bacteria for self-protection. This production of poisons is one of the most interesting features of the study of bacterial diseases, and it is probably true that these poisons, or toxins as they are termed, result both from the breaking down of the nutrient materials on which the bacteria feed, and as a result of their intravital activities. It is probably true that the action of bacteria as disease-producers depends largely upon the chemical products formed directly or indirectly by them, and that this action is shown by certain tissue changes that are produced in the body, local or systemic, and by symptoms of intoxication of varying character. The tissue changes that may be produced by bacteria are so various as to include almost every type of known pathological change. In general, however, they are those of a degenerative or necrotic nature, indicating direct damage, or they are those of a reactive defensive nature on the part of the body of the infected animal, the former indicating the degree of vulnerability, the latter the protective power that the tissues possess. Many of the symptoms occurring in bacterial affections result from the changes just outlined, and it is of importance to note as a special proof of the truth of the position that bacteria may cause disease that nearly all, if not quite all, of the changes found in the organs

DISEASES OF PLANTS

of a diseased body, and also the symptoms observed in infective disease, can be experimentally reproduced by the injection of bacterial poisons. Of the precise chemical nature of these poisons very little is known, therefore the general term toxins has been applied to them. It is known, however, that both the living and the dead bacteria contain these intracellular toxins, and therefore dead bacteria under certain circumstances can bring about destructive changes in the human body. It would seem from the recent work of Brieger, Martin, Fraenkel, and others that these bacterial toxins belong to the general group of albumoses, and that their action is analogous in many ways to a number of enzymes. Many of them are allied to well-known animal and vegetable poisons, such as ricin, abrin, and a number of the snake-poisons, particularly those of the rattlesnake and the heloderms. For theories of toxic action, and details regarding protective agencies of the human or other animal body in its struggle with disease-producing micro-organisms, see IMMUNITY. See also ANTITOXINS; DISEASE.

Diseases of Plants. Diseases in plants have existed as long as plants themselves—ages before the advent of man. Civilization and agriculture have usually developed together in all parts of the earth and it is not strange that anything that troubled or destroyed an important food plant should be observed and the cause sought. In the earliest historic records as well as in early Greek and Roman times some of the more destructive diseases of plants, like rust and mildew or blight of cereals were widely known and discussed. A special deity was recognized who ruled these phenomena and to whom sacrifices were offered.

Injury due to animals, especially insects, and to extremes of weather and unfavorable soil conditions were early often associated with their appropriate causes. It was not, however, until the latter part of the 18th and the beginning of the 19th century that the solid foundations of plant pathology were laid by the development of anatomy and physiology. The early works of Unger, 'Die Exantheme der Pflanzen,' etc., (1833); Weigmann, 'Die Krankheiten und Krankhaften Misbildungen der Gewächse' (1839); and of Meyen, 'Pflanzenpathologie' (1841), mark an important step forward in the embryo science of plant pathology. During this period microscopical, chemical, and physiological work with plants was active. The writers of this period rather overworked unfavorable nutrition as the cause of disease. Maladies that could not be traced to visible external causes were usually held to be due to unsuitable nourishment or the lack of something in the soil. It was not believed that the fungi so often found associated with diseases had any causal relation to them. They were held to be abnormal developments of the diseased cells themselves and not independent organisms. It remained for De Bary to determine the true nature and habits of fungi and bacteria and to demonstrate their causal relation to disease in many cases. His careful work gave a great stimulus to investigation in plant and animal pathology and opened what has proved to be the most important field of the science. His two most important works are 'Untersuchungen über die Brandpilze,' etc. (1853), and 'Morphol-

ogie und Physiologie der Pilze,' etc. (1866). Since De Bary the rapid development of the subject is well represented by the works of Hartig (1874-89), Frank (1880-96), Sorauner (1886-8), Marshall Ward (1889-1901). The last work, 'Diseases in Plants,' is one of the most excellent and readable expositions of the subject that has appeared.

Health and Disease Compared.—That there is no defined line between health and disease is generally recognized by pathologists and physiologists. A plant continually varies in response to changes in its environment. There is, however, for each individual and for a given species as a whole a certain accustomed range or power of adaptation to each factor of its environment and to the various combinations of these factors. The process of natural selection operates to perfect this adaptive attuning of the individual and the species as a whole to the conditions under which they live. If these conditions are subject to great extremes of moisture and dryness or heat and cold, the natural or indigenous vegetation will be found, as a rule, equal to the emergency, while an introduced species, if developed under an environment not subject to such extremes, might be seriously injured or destroyed, and if the change is very unusual even the indigenous species may suffer. A moist, warm, cloudy spring may be followed by dry hot weather and the tender watery growth be so much dried out and checked that it may be deformed and abnormal in shape, structure, and size. This variation may be slight or it may be great. If it is slight it may have no appreciable effect on the vigor and growth of the plant. The leaves become a little firmer and smaller and more resistant to the hot, dry conditions, while the maturer leaves that can not adapt themselves to the change turn yellow and fall, cut off by the parent plant. The plant is better for the change and can live under the modified conditions with greater ease and safety.

If the variation is greater the growth of the plant may be decidedly checked, the leaves being small and many more of them shed. In still more extreme cases the tender leaves may be dried up and killed either wholly or in part. According to Hartig, "It is only when the sickly condition leads to the death of some part of the plant that we may speak of actual disease." Where a few leaves, unable to adapt themselves to a changed condition, turn yellow and fall, the leaves themselves may be diseased, but the plant as a whole is benefited by their loss by being relieved of sources of uncontrolled drain of its water supply. As the loss of leaves becomes greater, however, we pass from the extremely localized disease to a point where the whole or a considerable part of the plant is weakened, either by the direct loss of food that should be furnished by the leaves to the rest of the plant structure, or by the use of reserve food in the reproduction of lost parts. It is evident in such cases that the border line between health and disease is hard to define. The case is not much easier if, instead of variations produced by moisture and temperature, we consider those caused by insects or fungi. A few leaves eaten from a tree by some insect or destroyed by a fungus might have no injurious effect on the tree as a whole, and might even be an advantage, but as the number of injured leaves increases the tree is weakened and

DISEASES OF PLANTS

its life threatened. Slight doses of certain poisons stimulate the cells to more vigorous growth, acting as a tonic, while a little larger dose poisons and destroys the cell. Leaving all questions of consistency of definition, we may practically define as diseased all those conditions of a plant which directly or indirectly endanger its life or prevent normal development under given conditions of environment. Or, as Marshall Ward puts it, "We may define disease as dangerous disturbances in the regularity, or interference with the completeness or range of the molecular activities constituting normal life—that is, health—and it is evident that every degree of transition may be realized between the two extremes."

Classification of Diseases.—The method of classification adopted is more a matter of convenience than importance. Most writers in plant pathology base their classifications on the causes of disease. Frank, for example, adopts the following outline: (1) Effects of insufficient room or space; (2) Effects of wounds; (3) Diseases due to atmospheric influences; (4) Diseases due to soil influences; (5) Diseases due to the action of injurious substances; (6) Diseases due to injurious plants; (7) Diseases due to injurious animals; (8) Diseases without any noticeable causes.

Hartig discusses diseases of trees according to the following scheme: (1) Diseases induced by Phanerogams; (2) Diseases induced by Cryptogams; (3) Wounds; (4) Diseases due to unfavorable conditions of soil; (5) Diseases due to unfavorable atmospheric conditions. While a classification based on cause is more scientific and more convenient for the pathologist, classifications based on the plant, the part of the plant attacked and the symptoms, are the most intelligible and convenient for those who devote themselves to the practical cultivation of plants. According to such an arrangement we should have diseases of roses, carnations, violets, lilies, wheat, corn, oats, rye, apple trees, peaches, plums, maple, alder, birch, etc. Under each head we could subdivide into diseases of roots, stems, leaves, flowers, and fruits, and again according to symptoms—decay or loss of parts, swellings, galls, shrinking, cankers, spots, discolorations, etc., finally coming down to the causes. It cannot be too strongly urged that pathologists writing for practical men adopt this latter type of classification at least as a key for the identification of specific diseases, as Hartig has done in his excellent work on the 'Diseases of Trees.' In practice we have in plant pathology, the same as in animal pathology, first carefully to examine, determine, and interpret the symptoms (diagnosis), then to find and study the causes (etiology). We are then in a position to determine curative measures (therapeutics) or preventive measures (prophylaxis).

The general survey of the subject of plant pathology as planned in this article is based on the following classification:

I. Constitutional conditions—predisposition and immunity.

II. Diseases without apparent cause.

III. Diseases caused by the non-living environment.

- (a) Conditions of soil or substratum.
- (b) Atmospheric conditions.
- (c) Temperature.

- (d) Light.
- (e) Electricity.
- (f) Shock or jars—mechanical.

IV. Diseases caused by the living environment.

- (a) Antagonistic association, crowding, isolation, etc.
- (b) Vegetable parasites.
- (c) Animal parasites.

Constitutional Conditions—Predisposition and Immunity.—A plant may be likened to a very delicately constructed and complex machine automatically adjustable under certain conditions and capable of running and doing work if properly supplied with energy. The accurate and perfect working of the machine depends first upon the perfection of its construction and adjustment, down to the minutest detail. If it comes from the manufacturer with a wheel or screw missing, or the parts incorrectly adjusted or made, it must do its work, if at all, with more or less imperfection, and we may consider that the mechanism has a constitutional difficulty or imperfection. Perhaps a new machine is assembled from parts of old ones so differing from each other that it becomes impossible to produce a perfectly co-ordinated mechanism. Some of the variations that occur in the constitution and organization of plants during the processes of reproduction and development are of the nature of such imperfect construction or adjustment. When these imperfections endanger the life of the plant we have a constitutional disease, or at least a predisposition to disease.

Predisposition to disease may be normal or abnormal. Normal predisposition is where some perfectly normal condition of growth makes the plant liable to injury. Young cereal plants, for example, are liable to infection by smuts, while older plants are quite resistant. When the formation of young, tender growth coincides with the spore dissemination of some fungus or the prevalence of some insect best able to attack growth in such condition, the plant is at this stage normally predisposed to such attack. In the same way there may be normal predisposition to injury by cold, light, heat, etc., but in no case of this kind could the predisposition be considered in any sense disease. Abnormal predisposition is where some abnormal change takes place in the plant from any cause which lowers its vitality or resistance, and which is in itself a pathological condition. Wounds and mechanical injuries may permit the entrance into the plant of insect or fungous parasites, as is the case with many of the wood rot fungi. Injuries from cold or heat may reduce the normal resistance to parasites. Plants which have been severely chilled during rapid growth, though not to the point of killing or even freezing, are often unable to resume normal growth even under the most favorable conditions. They appear to be partially paralyzed and are in this condition extremely subject to insect and fungous attack. So may predisposition develop as the result of starvation, overfeeding, or unbalanced nutrition even before the initiative pathological changes have become chronic.

Genera, species, and individuals vary among themselves in liability to disease or resistance to it as they do in other ways. Races resistant or immune to certain unfavorable conditions or

1-6. Brand-fungi (Ustilaginaceae) of Oats and Wheat, with Spores. 7-10. Potato Rot. 11-15. Rusts, showing effects on leaves. 16. Leaf affected by Ergot-fungus, showing development and effects. 17. Oidium-growth. 18-23. Hymenomyces Fungi (Oidium).

DISEASES OF PLANTS

parasitic enemies are common in nature, and may develop as the result of natural selection, or more quickly and certainly as the result of artificial selection of a natural tendency. If a natural tendency to resistance is not present in a given species, race, or variety, it may be introduced into new generations through the processes of breeding and selection combined. The production of plants for special purposes resistant or immune to certain diseases, is proving of immense value to agriculture. On the other hand, both in natural and artificial selection and breeding, non-resistant or sensitive individuals, varieties, and races may develop or be developed unusually subject to disease.

Seedless or non-fertile individuals may result from too close fertilization, or where the parents are too distantly related; or if seeds are produced in such cases, the individuals grown from the seeds often lack in vigor or reach an incomplete or imperfect development the same as in animals.

Many species of plants, like the violet, strawberry, lilies, and bulbous and tuberous rooted plants in general, are naturally propagated by vegetative offshoots, runners, buds, bulbs, etc., and by seeds. The seed generations under normal conditions are usually the most vigorous and variable. Take, for example, plants from the seeds of *Lilium harrisii* (Bermuda lily), derived from crossing individuals of the same variety, as compared with plants from bulblets of the same individuals propagated for many years by bulb generations, and note the differences. The plants direct from the seed and from the bulbs produced by the seedling generation are relatively much more vigorous than the plants from bulbs distantly removed from a seed generation. The latter are much more sensitive than the former to the attacks of aphides and red mites on the leaves and the bulb mites on the bulbs and roots. The latter are also more sensitive than the former to fungous parasites, and to unfavorable conditions of the non-living environment. The same is true of the cultivated violets, especially the varieties that are propagated from runners and seldom produce seed on account of the doubling of the flowers. Long continued asexual propagation appears in these cases to gradually reduce the power of individual adjustment or adaptation to changes in environment, resulting in decreased vigor and resistance to unfavorable conditions. On the other hand, there are many varieties of plants thus propagated that do not appear to suffer in this way. That it is the cause of predisposition to disease in some cases, and even constitutional derangement, must not be overlooked in the study of the ætiology of a disease.

Diseases without Apparent Cause.—Under this head a number of obscure but well-defined diseases are grouped, the ætiology of which is still unknown. Among these are the California vine disease, peach yellows, and peach rosette, little peach, some forms of gummosis of the stone fruits, die back of the orange, and a score of other diseases, apparently contagious, though the cause has not yet been found.

Variegation.—Formerly variegations were included in this class. These are characterized by the development of white, yellow, or colored spots, blotches, segments, stripes, or bands in the otherwise apparently normal green leaves. The transition from the diseased to healthy

cells is usually sharp and well defined from the youngest to the oldest stages of the leaves or other tissues involved. Any particular cell is subject to the disease only while in a state of active division. It therefore never spreads to a cell that has stopped dividing. The diseased cells are usually smaller than healthy cells, and are of much slower growth. The nucleus and protoplasm are more vacuolate, but the most apparent change is in the development of the chloroplast and the chlorophyll. The chloroplasts may be reduced in number and size, and the chlorophyll may be reduced or entirely absent. The change in the diseased cells themselves is often progressive, starting with a reduction of chlorophyll, gradually fading to yellow, then to white as the cell matures. In many cases the disease is transmitted through the seed and is thus hereditary. In others it is propagated only by division of the original plant by buds, cuttings, etc. When a variegated bud or branch is grafted into young, rapidly-growing tissues of a normal or healthy plant of the same variety, branches formed above and below the graft often become variegated, demonstrating that the disease is thus transmissible or infectious. When it once appears in a plant it is very persistent, especially when it has gone to the point of involving the seed generation. Sometimes, however, a plant which has been producing variegated growth suddenly returns to the normal green. While such changes are usually classed as spontaneous variations, they differ in many respects from normal variation. Recent investigations by the writer and others have demonstrated that variegations, including the so-called mosaic diseases, develop as the result of certain disturbances of nutrition of the young dividing bud cells. Certain substances (oxidizing enzymes) present in the cells in an inactive form or in small amount become active or increased in quantity and prevent the development of chlorophyll or cause it to fade. These enzymes injected into the growing points of healthy buds, as demonstrated in the case of tobacco, cause the disease in all dividing cells infected. We have here, then, a toxic enzyme produced by the plant itself under certain disturbing conditions capable of producing the same disease whenever the enzyme comes in contact with dividing cells. The abnormal increase in this enzyme may be brought about in several ways—as by a chill during rapid cell division, severe cutting back, root injury, or defoliation, followed by the production of new growth in the absence of sufficient reserve food, especially proteid. Consult Bulletin 18, Bureau of Plant Industry, United States Department of Agriculture.

All forms of variegation weaken the tissues involved and make them more subject to insect and fungous attack and more easily injured by cold or high temperature. Besides this the changes are in themselves strictly pathological, and threaten or cause the premature death at least of the parts affected.

Albinism.—When the loss of the green coloring matter is complete and apparently spontaneous, not curable by addition of some lacking nutrient, it may be classed with variegations. Other forms of albinism, yellowing or chlorosis are brought about by lack of iron, excess of lime, carbonic acid, lack of light, etc., and will be further discussed when these factors are

DISEASES OF PLANTS

considered in relation to disease. The cure and prevention of diseases of this class must be based on securing and maintaining a correctly balanced nutrition for the young cells—protecting them from shocks, especially those due to temperature variations. Peach yellows and rosette, California vine disease, die back of the orange, and diseases of this type can be controlled only by rooting out the diseased individuals upon the appearance of the first symptoms. At the present time we know no cure for these particular diseases. In many respects they behave like variegation or mosaic diseases.

DISEASES CAUSED BY THE NON-LIVING ENVIRONMENT.

From what has been said in previous paragraphs, it is evident that unfavorable physical and chemical conditions of the soil, excessive dryness or moisture of the soil or atmosphere, unfavorable conditions of temperature, light, etc., may cause derangements resulting in temporary or chronic disease. Plants which have become adapted by natural or artificial selection to a certain range and sequence of soil, moisture, temperature, and light conditions usually suffer some sort of derangement if exposed to a set of conditions materially different in any particular factor, group of factors, or in the relation of these to each other. It is absolutely necessary, therefore, in studying the ætiology of diseases to know the natural or constitutional requirements of the plants and their powers of adaptation. This knowledge can be obtained only by long and intimate acquaintance with the kind of plants in question under varying conditions.

Soil.—In natural conditions it is a matter of general observation that certain varieties of plants thrive best on particular kinds of soil, the same as in particular conditions of light, temperature, and moisture. The storage and movement of water in soils and its availability to plants, the solution of soil foods, nitrification, temperature, and aëration depend largely upon the structure or physical composition of the soils. Water, food, air, and temperature are among the fundamental requirements of vegetation. It is the varying amounts and relations of these factors maintained by a given soil that largely determine whether or not it is *naturally* suited in a given region to a particular class of plants. Where all these conditions are under easy control the kind of soil is a matter of less importance. The work of furnishing and maintaining proper conditions is done by the gardener instead of by the soil in the latter case. It is not profitable, however, to employ soils that require close and constant attention, even where conditions are largely under control. It is the aim of economical production to select a soil for a given crop that, with a minimum of labor expended on the part of the cultivator, produces the desired results. It is evident from these considerations that the conditions of the soil must be considered in connection with all of the other factors of environment, as no one of them ever acts independently and alone in the production of disease. The plant, too, has to be considered. It may be adapted to withstand the variations that take place in a sandy soil in a locality characterized by particular meteorological conditions,

while it could not thrive in a clay soil in the same locality. On the other hand, with changed meteorological conditions the same plant might do best in the clay soil.

Root Suffocation.—This is one of the most usual diseased conditions caused by physical conditions of the soil preventing the ready access of atmospheric oxygen or the ventilation of the soil. A very fine sand closely packed, or a clay soil with a crust excludes the air, unless the sand is stirred or the crust broken. Carbon-dioxide accumulates and the oxygen is reduced. The root hairs and feeding roots die for lack of sufficient oxygen for respiration. Growth is checked by starvation due to reduced root action. The tissues become hard and woody. The plant may then die in dry, hot weather by desiccation, or it may simply starve to death. Plants injured in this way, even slightly, often become the prey of insects and fungi, especially of those that attack the roots. This form of suffocation is also often found where the roots of plants have to grow under close pavements or hard packed ground or heavy sod. Another form of root suffocation results from poor drainage or excess of moisture in a soil, thus excluding the oxygen and preventing soil ventilation. The feeding roots die and ferment, not only cutting off the proper absorption of soil food elements but resulting in poisoning the plant by products of fermentation. The leaves rapidly turn yellow and drop, and unless the soil is dried out and aërated the plant soon dies. This latter form of root suffocation is very common among plants grown in pots or tubs. When the natural drainage is stopped up or the plant is over-watered, the soil becomes sour.

The best thing to do in such cases is to repot the plant into fresh soil containing a little lime or wood ashes, first washing off the old soil and trimming off the diseased roots. Good drainage must be furnished and over-watering avoided. It must be clearly understood that the roots of all plants require an abundant supply of oxygen, and that they will suffocate and die if they do not get it.

Poisonous materials in the soil are also often the cause of serious root injury. Illuminating gas leaking from gas mains or pipes and diffusing through the soil in the minutest quantity kills and poisons the roots of all kinds of vegetation. The only thing to do in such cases is to stop the leak and air the soil.

The decomposition of organic matter, especially manures rich in nitrogen, in soils not well supplied with oxygen, results in the formation of products injurious to the roots of plants. Injurious acids are often set free from their combinations in the soil by the action of plant roots, bacteria, and fungi, and by chemical changes brought about by the use of certain fertilizers, like the acid of superphosphates. In all those cases a liberal addition of lime to the soil acts as a cure to the injured plant and corrects the acid condition.

Alkali Soils.—In some cases, on the other hand, there is too much lime or other alkaline material such as carbonate of soda, etc., in the soil. The root hairs and feeding roots are killed by a sudden rise of a soluble alkali, or they may die a slow death if there is too much lime. It is a curious fact that a liberal addition of gypsum tends greatly to reduce the injury in both these cases and to raise the limit of endurance

DISEASES OF PLANTS

of most crops to alkali. Where alkalies can not be washed out of soils through proper drainage, much can be done by breeding and selecting varieties of plants better adapted to such condition. Great progress has already been made in this direction with alfalfa, sugar beets, cereals, date palms, etc.

Soil Nutrients.—Every green plant requires for its healthy development, besides water, oxygen, and the CO_2 of the air, a certain proportion of nitrogen in the form of nitrates or ammonia, a salt of potassium and of phosphoric acid, available calcium and magnesium in about equal proportion, sulphur, and a trace of iron and chlorine. If these are not available to the plant in the right form or ratio, or if any of them is too greatly in excess or lacking, a diseased condition of the plants in such soils quickly develops.

Nitrogen.—Lack of nitrogen in available form causes a proportionately diminished vegetative growth, light green or yellowish leaves, even where there is abundant moisture and other nutrient materials. An excess of nitrogenous fertilizer, on the other hand, causes various pathological derangements. Abnormal vegetative growth at the expense of flowers and fruit thus inducing temporary sterility is one of the commonest results of a food containing too much nitrogen in comparison with potassium and phosphoric acid. The tissues in such cases are likely to be soft and watery, easily injured by unfavorable temperature or moisture conditions as well as by insect and fungous parasites.

Tissue degeneration is in many cases the result of over-feeding with nitrogenous fertilizer. This appears to be one of the commonest causes of "die back" or gummy degeneration of the orange. Peaches and plums also suffer from a similar malady from the same cause. Large gum pockets develop in the wood as a result of the degeneration of the cells. The movement of water and food materials in the plant is greatly interfered with. The wood does not mature properly and as a result winter kills, or is destroyed by insect and fungous parasites.

Phosphoric acid is an important constituent of every living cell, entering largely into the composition of the nucleus. Its reduction below the cell requirements is followed by a cessation of cell division and growth and in green cells by disorganization of the chlorophyll which first becomes reddish, then yellow. These latter changes take place first in the maturer leaves, then in the younger parts. An application of phosphates or superphosphates usually promptly corrects these pathological conditions.

Potassium also is required in considerable quantity by all plants. One of the first signs in a plant of a lack of available potassium is a decided cessation of growth without other apparent cause of trouble. During the early stages of potash starvation the plants often retain their normal green color. In later stages very little starch or sugar is made and almost no protein or nitrogenous matter. Unless the missing element is supplied the plants finally become yellow and slowly die. Potassium hastens and perfects the maturing of plants, especially the ripening of the wood of perennial plants, making them less liable to winter injury.

Calcium.—Lack of this element in plant nutrition is first indicated by a more or less marked yellowing of the young leaves due to a reduction in number and size of the chloroplasts though the chlorophyll itself may be normal. The starch made by the chloroplasts is converted with difficulty into sugar. This retardation is probably due to the fact that in calcium starvation the production of the starch transforming enzyme (diastase) is greatly reduced.

Magnesium.—While this element does not appear to be of such fundamental importance to the vegetable cell it is nevertheless absolutely required, especially during the periods of flowering and fruiting. A very small amount may often suffice to meet the requirements of growth up to the flowering period, but at this time a decided lack of magnesium results in the failure to set fruit or its failure to mature. With a more decided lack normal vegetation soon ceases, proleptic shoots develop with shortened stems, small, distorted, yellowish leaves crowded together in rosettes somewhat resembling potash starvation except in color.

It appears to be necessary that magnesium and calcium always be associated in plant cells except in some of the lower classes of plants. The ratio of one part of

magnesium to three of calcium is the most favorable in many cases though this is quite variable for different species. In a large number of cases an excess of magnesium over calcium results in greatly retarded growth and an early death of the cells.

Both magnesium and calcium oxides (lime) play a secondary part in the soil by combining with the acids set free by root action, fermentations, and other biological and chemical processes. If these were not at once combined the root hairs and feeding roots would be injured or killed and the plant would suffer from general starvation if not actual poisoning.

Sulphur.—This element usually absorbed by plants in the form of sulphates is one of the absolute requirements of all organisms. It enters into the structure of protoplasm and the more highly organized nitrogenous foods, proteins, required as the direct food of growing cells. Its abnormal reduction results in the cessation of proteid manufacture and consequently causes proteid starvation. Growth ceases and death follows unless the element in some available form is supplied.

Other elements and compounds are often important to the plant though not required. Silica for example is found very commonly deposited in the cell walls of plants, especially in the epidermal cells of cereals and grasses. Its presence stiffens the stems and leaves and in a measure protects them from biting and sucking insects and other small animals. Aside from decreased resistance to such attack a plant grows as well without silica as with it.

Chlorine.—This element in very small quantity appears to be necessary to the vigorous growth of plants, especially during the formation of flowers and fruit. In excess it is usually injurious except to plants adapted to soils rich in chlorides, such as sugar beets, asparagus, celery, etc. It is an interesting fact that sugar beets and celery are rendered much more resistant to spot diseases caused by *Cercospora* when well supplied with sodium chloride, than without it. Why this is so has not been determined.

Iron.—A small amount of this element is necessary to the formation of chlorophyll. An insufficient amount of iron is indicated very quickly by the formation of chlorotic or white leaves which become green on the addition to the soil of a soluble iron salt, such as iron sulphate. Often the failure of a plant to obtain iron is due to the death of the root hairs and feeding roots from various causes, alkali or acid, excessive moisture or dryness, insect or fungous attack, etc. In such cases, however, there are indications of general starvation as well as of lack of iron, and the diseased condition can be cured only by removing the cause of the death of the roots.

Atmospheric Conditions.—The close co-ordination between the conditions affecting the plant in the soil and atmosphere is at once apparent. In most of our ordinary plants water, with various materials in solution, is absorbed by the roots from the soil and passes up through the stem to the leaves and other parts above ground. From these there is a continual loss of moisture, regulated in part by the plant, but depending largely upon whether or not conditions of the atmosphere, light, etc., favor evaporation, or transpiration as it is more correctly termed where living plants are under consideration.

Moisture Variation.—Plants growing in soil and air uniformly moist have smaller root systems and a larger total leaf surface than they would have if grown under constantly varying conditions of soil and atmospheric moisture. A plant reared in a moist greenhouse will gradually shed its older leaves if the air is allowed to become too dry or the plant is removed to an ordinary dwelling room. The new leaves that develop under such circumstances are adapted to the drier air and are better able to retain the water furnished by the roots. If, however, the change from moist to dry is too sudden, the defoliation will be excessive and the new growth may develop very slowly and be poorly nourished. In the case of house plants there is almost a universal tendency to over-water the plant at such times. This brings on suffocation

DISEASES OF PLANTS

and death of the root hairs and feeding roots, and ends in death of the plant. Instead of watering under such conditions the soil should be allowed to become comparatively dry until renewed growth of leaves creates a demand for water from the roots.

Plants which have been growing for a considerable period with a comparatively small water supply develop a large number of root hairs, and firmer and smaller leaves adapted to reduce transpiration to its lowest terms. If a cloudy, wet period suddenly follows, or the plants are over-watered, they become gorged with water. The more plastic tissues start into growth, with the result that the leaves often become distorted, wrinkled, curled, or twisted. If there is a continued excess of moisture many of the root hairs and finer roots may die, and symptoms of root suffocation develop, the leaves become spotted with yellow and finally drop off.

Edema is a pathological condition characterized by the formation of water blisters or warts on the stems or along the vascular bundles of leaves over-gorged with water. This diseased condition often develops in plants growing in moist situations, especially under conditions where the soil is likely to be warmer than the air, thus favoring absorption of water by the roots but not favoring transpiration through the leaves. The disease often develops, also, in extended periods of moist, warm, cloudy weather.

Burning or Scalding.—The growth that plants make under cloudy, moist conditions is often watery and soft, an easy prey for parasitic fungi, and likely to dry out, wilt, and die easily if suddenly exposed to clear, hot weather. Such "burning" or "scalding" of the edges and tips of leaves is very common in the spring, when moist, cloudy periods are suddenly followed by clear, hot days.

Wind often causes injury by whipping and tearing the leaves or breaking limbs. In the latter case injuries are produced which predispose the plant (especially trees and shrubs) to attack by insects or fungi. Whenever possible all such injured parts should be cut out to uninjured tissue, and protected by antiseptic washes or grafting wax. Dry, hot winds coming early in the summer often cause the death of tender foliage by desiccation.

Injurious Gases.—Slight traces of illuminating gas escaping in rooms or greenhouses, or the slightest trace of sulphurous fumes from burning coal from furnaces or stoves, is extremely injurious to vegetation. The presence of these gases in the atmosphere causes the gradual yellowing, browning, and finally the death of leaves, especially the tips and edges. Although the soil, temperature, and light conditions may be the most favorable, the plants gradually die where they are more or less constantly exposed to a trace of these gases. In the neighborhood of factories or large cities vegetation is often injured, as described, by these and other poisonous gases. In some cases the amount of poisonous gas thrown into the air with the smoke from certain factories is so great that vegetation of all kinds is unable to thrive in the neighborhood. The injury extends often several miles from the factory in the direction of the prevailing wind.

Temperature.—Many predispositions to dis-

ease, as well as specific pathological conditions, are produced in plants as the result of unfavorable temperature conditions. As a rule, when growth is taking place and the cells contain much water, vegetation is most sensitive to heat and cold. When growth has ceased and the tissues are mature or in a resting or dormant condition and contain much less water, they are least sensitive to heat and cold. The temperature range for any individual during growth, and even in the dormant or resting condition, varies for different individuals, varieties, and species. These temperature ranges have become more or less fixed within certain limits for different individuals and species through the influence of the temperature factor in the environment under which the species or individuals have developed. Thus, plants adapted to long growing seasons of the South will not thrive in the shorter, colder season of the North. On the other hand, many plants adapted to northern conditions do not thrive in the South. When an individual or a species becomes adjusted or accustomed to the conditions and changes of a particular environment it may be unable wholly or in part to adjust its life processes to an unusual change in any factor or group of factors or the relation of these to each other. The orange, lemon, lime, and numerous other sub-tropical fruits, for example, do not have a well-defined resting or dormant period like the apple, pear, peach, etc., in the North. They would therefore be quickly killed if exposed to severe frosts.

Certain varieties of peaches and plums which survive Northern winters without injury, when planted in the South often winter-kill. Extended warm spells in the latter part of winter, and the warming effects of the sun on the south and southwest sides of the trunk start the activity of the cambium, which is subsequently injured or killed by freezing, the same as are young buds pushing out too early in the spring under the influence of warm days and then caught by the late frosts.

Varieties that start into growth readily under such conditions may be completely winter-killed if the conditions are such as to stimulate a general premature activity. If only the tissues warmed by the direct action of the sun are involved, patches of various size may be killed. These usually start near the surface of the ground on the southwest side of the tree, and extend up the trunk to the limbs, varying in width from a few inches to the whole south and southwest side.

Winter Sun Scald.—This term is usually applied to cases like those just described where smaller areas on the south or southwest side of trees are killed during winter by the successive warming and freezing of the tissues. This form of injury is common in the North and West. Considerable protection may be afforded in all such cases by coating the tree with whitewash or protecting it from the direct action of the sun in some way.

Winter Desiccation.—Evergreen trees and shrubs are often killed or greatly injured during periods of bright, warm weather in the winter by rapid evaporation of water from the leaves while the ground and roots are frozen and unable to replace what is lost.

Another form of winter desiccation is through the direct action of freezing, where, by intense

DISEASES OF PLANTS

cold, the water is drawn so completely from the protoplasm into the cell walls or intercellular spaces in the formation of ice crystals that the cells are unable to re-absorb water on thawing. This effect of freezing is similar in many respects to that of drouth. Water is withdrawn from the protoplasm to a greater or less extent, according to the duration and severity of the cold and the retaining power of the protoplasm. If the withdrawal has not been too great, and thawing process is slow so that the cells can gradually re-absorb what was given up in freezing, the plant may suffer no harm. If on the other hand, the tissues are thawed rapidly, the air is driven out of the intercellular spaces and the cells may die for want of oxygen or the water may be lost by evaporation before it can be reabsorbed. Frozen plants should therefore be thawed slowly and protected from evaporation by sprinkling with cold water or shading. While most cases of injury from freezing are due to the conditions just described, there is another class of cases where the injury is apparently due to structural and chemical changes in the protoplasm induced by the cold.

Cold Rigor.—As already pointed out, the sensitiveness of protoplasm of various plants and at various stages of growth differs remarkably, but in all cases during vegetative activity there is a point either a little above or below the freezing point of water where protoplasmic movement and growth cease without the cells being necessarily frozen or killed. This condition is known as cold rigor, and is often taken advantage of by florists and gardeners in holding their flowers or fruits temporarily in some particular stage of development for a particular market period. Usually when the temperature is raised the growth continues normally, but occasionally, if the temperature is a little too low and long continued, the plant fails to respond again to a higher temperature and is found to be in a state of permanent rigor or paralysis; though the plant does not die, it makes little or no growth.

Mechanical Separation of Cells.—In many parenchymatous tissues, leaves, bark, parenchyma, fruits, etc., which can stand considerable freezing without injury to the protoplasm, there is more or less rupture of the cells from each other by the formation of ice in the cell walls or intercellular spaces. In some cases the epidermal cells are almost completely separated from the rest of the tissue. In other cases, as in apples and bark parenchyma, the individual cells may, in extreme cases, be separated and form a powdery mass. If the separation is complete the cells die after a time. In any case, even a partial separation and breaking of the protoplasmic connections between the cells interferes with normal development, and may cause the premature death of the whole or parts of the plant by interfering with the movement of food materials, etc.

Frost-cracks.—These usually occur as the result of rapid freezing and shrinking of the outer tissues of trees, especially while the inner tissues are relatively warm. After the cold period is over and warmer weather comes such cracks close up.

Frost Canker.—This name is applied to wounds that are prevented from healing through the action of late frost in killing the callus rings as they develop. The killing of roots and the

lifting of plants from the soil by freezing are familiar phenomena to all gardeners, but further consideration of this subject can not be undertaken here.

Scorching or Burning.—Sometimes in hot, dry weather smooth-barked trees and shrubs may have portions of their tissue exposed to strong sunlight actually killed by the high temperature. In light-colored, sandy soils the reflection of heat from the sand often kills the lower leaves of low-growing trees, shrubs, and especially of herbaceous plants. The reflection of sun heat from the south or west side of buildings, etc., may also cause similar injury. The direct injury in such cases is often, however, confused with the effects of excessive transpiration. The burning effect of hot, dry winds is largely due to the excessive transpiration they induce. The burning is especially severe when there is an insufficiency of soil moisture as the result of drouth or lack of proper cultivation.

Sudden Variations of Temperature.—As already indicated, the injury resulting from changes of temperature above the maximum or below the minimum for a species or individual depends in large measure upon the rapidity of the change. If the change is slow, even the individual plant may adjust its vital processes to temperatures which would have resulted in death had they been sudden. Some of the algæ, for example, live in hot springs at a temperature of 93° C., while the original stock from which these forms were derived lives in water rarely exceeding 40° C. A transfer of individuals from 40° to 93° would result in almost instant death, while by slow, gradual change they could be accustomed to this extreme temperature. For flowering plants (Phanerogams) the possible maximum is much lower, 50° being the extreme limit, while the average limit is from 37° to 46°.

Sudden variations well within the fatal limits, however, are productive of pathological changes. A rose, tomato, violet, or almost any other plant grown at a cool temperature (8° to 15° C.), all other conditions remaining the same and then suddenly exposed to 24° to 27° C., will turn yellowish, become weak and spindling and very sensitive to insects and parasitic diseases. The same plants, started at 24° to 27° and growing normally at that temperature, if suddenly dropped to 15° or 8° become yellowish and weak and very sensitive to parasite enemies. In either case the change from one temperature to the other could be made without serious injury if made gradually and slowly. For a general discussion of this subject with references to literature, consult Davenport's 'Experimental Morphology.'

Resting or Dormant Period.—A resting or dormant period is more or less well defined in many perennial plants. In northern and temperate latitudes this period coincides with cold weather and has developed in response to this constantly recurring seasonal change. In other cases in hot climates a partial rest may occur during the dry season. In many cases this period of rest has come to be a necessity to the normal and healthy development of the plant. Detmer and Müller-Thurgau have shown in the case of potato tubers and many dormant buds that in the fall and early winter the tissues contain only enough sugar to meet the demands of

DISEASES OF PLANTS

respiration of the dormant cells, not enough to stimulate growth. Müller-Thurgau has demonstrated that exposure of tubers dug in August to 0° C. for a few weeks causes an accumulation of sugar sufficient to start normal germination when the cooled tubers are placed under favorable conditions. The cold reduces the amount of sugar used in respiration and probably also causes an increase of diastase, the enzyme that converts starch into sugar. The same has been shown to be true also in the case of the dormant buds of many trees and shrubs. Exposure of dormant buds, bulbs, tubers, etc., to sulphuric ether for several days has a similar effect to that produced by exposure to cold. In the case of plants that have their dormant or resting period in dry weather there is an accumulation and modification of reserve foods preparatory to the next season of growth. Buds, bulbs and tubers may often be forced to grow before they have accumulated sufficient reserve food in the proper form, but the result is usually a weak plant very subject to disease. A good example of this may be seen in the attempt that is often made to force bulbs that are immature and that have not had their normal period of rest or have been forced the previous season. Variegation or mosaic disease is also often produced in this way.

Light.—Practically all the chlorophyllaceous plants are dependent upon sunlight for normal development and activity. Every individual and every species is adapted or attuned to a particular range of light intensity, and suffers injury if the intensity becomes too great or too small, or if the change from one intensity to another is too sudden.

Injury from Strong Light.—Many bacteria and fungi, for example, *Bacillus anthracis* and *Botrytis cinerea*, grow best in darkness or very weak light, but are killed in a short time by exposure to sunlight or to artificial light strong in the blue-violet rays. It is this portion of the spectrum that causes the chemical disorganization of the protoplasm, or rather its destruction by oxidation as in the absence of oxygen during exposure no change takes place. The same is true of the more highly developed chlorophyllaceous algae and shade plants—too strong light not only destroys the chlorophyll by oxidation induced by the blue-violet rays, but the protoplasm itself may finally be thus killed or chemically disorganized. This is also well shown in the injurious effect of the ultra-violet rays in the naked electric arc light. A glass globe which cuts off these rays prevents the injury. This pathological condition in varying degrees of intensity is produced not only in shade plants when exposed to direct sunlight, but also in other plants when grown in the shade and suddenly exposed to strong light. It is also common when an extended period of cloudy or foggy weather in the spring is suddenly followed by bright, clear days. Under such conditions there is not only a partial destruction of the chlorophyll, but an excessive loss of water from the poorly cuticularized leaves. Such leaves are also unable to close their stomata quickly, which is another reason for their suffering from excessive loss of water. The action of light in promoting evaporation or transpiration is mainly by raising the temperature of the tissues above that of the surrounding air. When the air temperature is very high the increased

temperature of the tissues of plants exposed to strong sunlight is often sufficient in itself to cause injury or death.

Injury from Weak Light.—While too strong light can not be endured by any plant, lack of light is injurious only to chlorophyllaceous plants. When the light intensity is reduced below the minimum for any of these plants the synthesis of carbon and nitrogen compounds is reduced accordingly until in very weak light or darkness the plant can make no use whatever of the carbondioxide of the air. That the plant will starve in proportion to the reduction in photosynthetic activity is evident.

Electricity.—That electrical conditions of the earth and atmosphere and of the plant have an important relation to the physiological condition of the latter has been demonstrated in many cases, but the full significance of this relation is not yet understood. Plants vary in sensitiveness to electric currents in much the same way that they do to light or heat. A current above the maximum for a plant causes the disorganization and death of the protoplasm. This is often accomplished by a comparatively weak direct or alternating current, but is perhaps most familiar in cases of injury or death from currents of high intensity, as from electric light wires or lightning stroke.

Mechanical Injury.—Finally, among the causes of disease in the non-living environment, we have to mention mechanical injuries, such as those produced by hail, wind, falling trees, etc. Hail stones often severely cut and tear the foliage of trees and herbaceous plants, and may also produce more or less serious wounds in the more resistant tissues. Wind may injure the foliage, break limbs, etc., as may also falling trees. In all these cases, except in the most severe forms, the greatest danger comes from the entrance into the tissues of the wounded plant of parasitic insects and fungi. Large mechanical wounds, however produced, should have antiseptic treatment where practicable, especially in large and valuable trees. The injured parts should be trimmed to healthy tissue in such a manner as to favor rapid formation of callus. After a wash of some disinfectant, such as copper sulphate 1 per cent solution in water, the wound should be protected by shellac or grafting wax, or white lead paint.

DISEASES CAUSED BY THE LIVING ENVIRONMENT.

Struggle for Room.—The results of crowding are so familiar and apparent that discussion of the subject is scarcely required. The strong plants occupy the soil with their roots and the air space with their leaves and branches, crowding out the more backward or weaker individuals or species. Some are thus starved to death, others are reduced in size and vigor according as they lack the proper space in which to grow.

Plant Associations.—Plant associations spring up controlled by certain dominant species. Each individual of such a community has its influence on the others. The shade of a tree keeps back some sun-loving species and makes it possible for shade-loving species to grow, and so, with countless inter-relationships, plant communities develop, often of great complexity. If the tree or other dominant factor is removed the changed conditions are followed by a breaking-up and readjustment according to the new conditions. Many of the former occupants of

DISEASES OF PLANTS

the area will be starved or crowded out in the struggle. Others may suffer from excess of light or too high temperature. Disregard of the natural requirements of plants and their interrelations in communities often leads to disastrous results in clearing or planting in landscape gardening.

Symbiosis.—This term was first used by De Bary to designate plant partnerships such as those represented by the co-operation of fungi and algae in the formation of organisms known as lichens. The fungous hyphae surround the algae cells and furnish them with water and dissolved salts from the substratum, and the algae in return supply to the fungus hyphae the required organic nutrient materials. The community forms in itself a specific vegetable organism, though under favorable conditions of nutrition both the fungus and the alga forming the lichen may live independently of each other. Another type of symbiotic relationship is found in the so-called *Mycorrhiza*, or fungus roots. These are specially common on plants growing in humus. Two types are distinguished, one where the fungus is in close external union with the roots, covering them with its filaments and preventing the formation of root hairs, actually taking their place by supplying the plant not only with water and mineral food but also with organic nutriment from the humus. These external associations are usually termed ectotrophic mycorrhiza.

Monotropa hypopitys is a good example of a non-chlorophyllaceous plant dependent upon ectotrophic mycorrhiza for its food. Among forest trees the phenomenon is very common, especially in the *Cupulifera* and *Abietinae*. That the fungus mantle in these cases supplies the host with food materials from the humus has been amply demonstrated. Ordinarily the host plant in these cases furnishes little or nothing to the fungus, which is able to obtain all its nutriment from the humus. In some cases, however, the Mycorrhiza fungus has been observed to penetrate the root sheath and become parasitic. It is a short step from this condition to the cases where the fungus is normally internal, forming the so-called endotrophic mycorrhiza, as in many of the *Orchideae*, *Ericaceae*, *Epacrideae*, *Empetraceae*, and representatives of other groups living in humus soils. In many of these cases, while the plants are not in any way apparently injured by the fungus, they can thrive as well without as with it, and the relation of the fungus to the host has not as yet been fully investigated. Among the *Leguminosae*, however, the case is different. All legumes in their native soils have their roots covered with "tubercles." These develop as the result of stimulation produced by certain bacteria which enter the young roots through the root hairs and grow symbiotically within the cells. The bacteria draw their organic nourishment from the stores in the root, and in return secure nitrogen directly from the atmosphere which afterward becomes available to the legume. Legumes with these tubercle bacteria can thrive in a soil absolutely devoid of nitrogen, whereas, without the bacteria, they could not live at all in such a soil. The failure of legumes to thrive in certain soils is often due to the absence of these tubercle organisms. On the other hand, the tubercle organism often degenerates into a mere parasite. Similar organisms are also

found in symbiotic relation in the alder and in several other groups of plants.

Vegetable Parasites. The true vegetable parasites (obligate parasites) are those which can not, in any phase of existence or stage of development live independent of the host plant. There are many true parasites both among the higher and lower orders of plant life. Many organisms, however, are parasitic during certain stages of their development, and saprophytic in other stages; where the parasitic nature is predominant they are called hemi-parasites; if the saprophytic phase predominates they are classified as hemisaprophytes. All of these classes are responsible for the production of diseases of various types. The true saprophytes, which live entirely on dead organic matter, are seldom the cause of diseases. The diseases of plants due to vegetable and animal parasites constitute by far the larger number of diseases and are those of greatest economic importance. In some cases, as previously suggested, it is difficult to determine whether we are dealing with a harmless symbiotic relationship or one where the host is more or less injured. In this doubtful category, for example, are to be placed the mistletoes (*Loranthaceae*). These plants possess leaves containing chlorophyll, and are related to their host the same as a scion to a stock. The true mistletoe of Europe (*Viscum album*) and its relatives in America (*Phoradendron flavescent*) are parasitic on a great variety of deciduous trees, and sometimes do considerable damage. Here also must be placed those endotrophic mycorrhiza of many plants growing in humus where neither benefit nor injury has been shown as a result of the presence of the fungus in the roots. Among the phanerogams, however, there are many true parasites, for example, the *Orobanchaceae*, which are devoid of chlorophyll and derive all their nourishment from the roots of the host plants to which they are attached. These parasites often do considerable damage to tobacco, hemp, lucerne, clover, and other crops. The Dodders (*Cuscuta*) are also true phanerogamic parasites, deriving all their nourishment from their host plants, which they overrun and penetrate with their sucker roots (haustoria). The most dangerous and prolific disease-producers, however, are the pathogenic fungi and bacteria.

Pathogenic Fungi.—The consideration of diseases caused by pathogenic fungi is usually based upon the fungus, and the genetic relationships of the fungi usually determine the order in which the diseases are discussed.

While this practice is undoubtedly the best one to follow in a systematic treatise, it is probably the cause of the erroneous impression sometimes encountered that the fungus is the disease. The disease is the functional or cell derangement of the plant or part of the plant. The same functional or cell derangement, and therefore strictly the same disease, may in some cases be produced by a great variety of totally unrelated causes. More attention should be given in plant pathology to the study of the disease itself, though not less attention should be paid to the determination and study of the cause. This latter course is especially necessary in the case of the pathogenic fungi, bacteria, or insects. A complete and accurate knowledge of the life history and nutritive requirements of pathogenic organisms furnishes

DISEASES OF PLANTS

the best foundation on which to base the procedure for preventing or controlling the diseases caused by them. As already suggested, there is every possible gradation among the pathogenic fungi, between the strict saprophyte (such as sooty molds), causing disease only by chance association, and the strict parasite (such as rusts and smuts), unable to exist independently of their living hosts.

Among the diseases caused by strict saprophytes may be mentioned the starved and chlorotic condition of many leaves and fruits due to the presence of sooty molds on their surface. These black, mold-like fungi grow in sugary excretions, especially the "honey dew" excreted by insects, aphides, scales, leafhoppers, etc. This black growth, where it covers the surface of leaves, occasionally cuts off so much light that the chloroplasts lose their green color, and the formation of starch and sugar is so greatly reduced as to cause partial starvation and general retardation of growth of the whole plant. This is intensified by the injury produced and the food removed by the insects.

Many of the saprophytic yeast fungi, molds, and bacteria cause fermentive decomposition in the weakened and dead cells of the wounded tissues, especially those rich in sugar or other reserve materials. Toxic products are thus produced which weaken or kill all the cells absorbing them. Such fermentations are especially common following mechanical injury to ripening fruits and to the sapwood of trees, in the latter case particularly following the work of borers. Fungi of this class grade imperceptibly into the hemisaprophytes or facultative parasites which start their vegetative development in dead or weakened tissues like the heartwood of a tree or the dead tissue of a wound, and then gradually spread into the living tissues, killing them. The best examples of this class are the wood-destroying *Polyporeæ* (bracket fungi), *Agaricineæ* (toad stools), and related fungi. When these get into the heartwood through a wound, or into an area of dead cambium bark or sapwood, they first fill the dead area with their mycelium and gradually spread into surrounding living tissue, in some cases by secondary action through decomposition products, or by cutting off the water or food supply from the living tissues, or by primary action, where the mycelium spreads from its saprophytic vantage ground directly into the neighboring living tissue.

In order to prevent wound infection of woody plants it is necessary either to keep the surface of the wound dry, preventing the exudation of sap and the entrance of water by searing with a hot iron, or by treating the injured surface with an antiseptic or protective coating, paint, or wash, such as coal tar, white lead, copper sulphate, etc.

Besides the hemisaprophytic wood-destroying fungi which gain entrance through wounds and are not able otherwise to infect a sound plant, there are others of the same class, such as *Agaricus melleus*, whose mycelial strands or rhizomorphs are able to work their way through the sound bark of numerous conifers, underneath the bark and in the wood of which the fungus produces dense white, felt-like mycelial membranes. These kill the bark and wood and stimulate an excessive flow of resin into the injured parts, finally resulting in the death of

the tree. This same fungus also attacks deciduous broad-leaved trees, but here it is more particularly a wound parasite.

Botrytis, *Pythium*, *Sclerotinia*, and many other fungi, though able to pass the whole of their existence as saprophytes, are also able under favorable conditions to infect the living tissues of plants and destroy them. It is a short step from these fungi to those of a slightly more decided parasitic nature, the *hemiparasites*, organisms which can not in nature complete their life history as saprophytes. The *Ustilagineæ* (smuts) are among the most familiar examples of this class. These grade imperceptibly into the strict parasites such as the *Uredineæ* (rusts), which can not live at all as saprophytes.

Among the strict parasites there is often a high degree of specialization, a given species of fungus being restricted in many cases to a particular genus or even species of plant. In some of the rusts there is a peculiar phenomenon of this nature known as heteroecism. Many species of rusts go through their whole life history producing all their various forms of spores on the same host. In other cases, however, spermatia and æcidiospores are produced on one host and the uredospores and teleutospores of the same fungus are produced on an entirely unrelated host.

Injury Caused by Parasitic Fungi.—It is extremely difficult to classify the various reactions of plants to parasitic attack. Every case has to be considered in a large measure individually. There are, however, certain general types of reaction and injury that may be noted. There are many parasitic fungi, for example, that attack the leaves of plants; some of these, like the powdery mildews, grow only on the surface of the leaves and younger stems, forming powdery, whitish spots or coatings and drawing nourishment from the surface cells by sending down into them short, root-like growths, *haustoria*. When these surface parasites attack the young growing leaves, stems, or fruits, the areas occupied by the fungus are greatly retarded in development, often causing more or less distortion of the leaves, and in severe cases often killing them and causing early defoliation. The flowers and fruit may thus also be destroyed. The proper ripening and maturation of the wood of perennials is often so much retarded by these direct and indirect effects that it winter-kills. When these fungi, however, attack only a few leaves on a plant, or where they attack the leaves after they are full grown, the injury is comparatively slight. Prompt burning of the fallen leaves in autumn is one of the best preventive measures. Sulphuring, so widely practised in the case of vine mildew, helps to rid plants of the fungus, and spraying with Bordeaux mixture is a good preventive as well as curative treatment.

Besides these external parasites there are a large number which penetrate and vegetate directly in the cells or in the intercellular spaces of the host. Some of these after a time kill the tissues in which they are growing, producing a dead area. If these dead areas are in the leaves and are numerous or large, the value and working power of the leaf may be seriously impaired or destroyed altogether. The destruction of the first crop of leaves often results from the attack of leaf-spot fungi early in the summer, and the plants are obliged to put out a

DISEASES OF PLANTS

second crop of foliage. This must be done at the expense of reserve food stores. In such crops as sugar beet, Irish potato, etc., this use of reserve food becomes evident in the reduction of yield of tubers and sugar. In crops like beets and potatoes, where there is a continual succession of new growth, a second attack is not so serious as in the case of trees and shrubs where two successive defoliations either kill the plant outright or so weaken it that it winter-kills or dies of starvation. The weakening effects of premature defoliation are often not fully realized. Where one premature defoliation has occurred from any cause, great effort should be made to protect the second crop of leaves and to stimulate the plant with nitrogenous fertilizers. If the plant is a perennial, some protection, if possible, should be furnished during winter, as the wood is likely to be poorly ripened. Practically all the leaf-spot diseases are easily controlled by spraying the foliage with Bordeaux mixture or other good fungicide. Immediate removal, if possible, and burning of the diseased leaves also serve to hold these diseases in check.

If prompt action of this kind is taken when the trouble first appears it may often be checked without other treatment. It is safest, however, to spray other plants with a fungicide whenever practicable.

Many fungi which may start by attacking the leaves are not limited to them, but spread to or even directly attack the stems. The *Peronosporae*, or downy mildews, are good examples of this class. Plants which have developed in moist, cloudy weather are particularly sensitive, and the parasite starting in leaves or stems may in a few days invade all the tissues of the plant, causing a rapid soft rot. The well-known "potato rot," often causing the complete destruction of the crop in a few days, is caused by one of this group of fungi. Many other crops are similarly affected by fungi of this group. Like the leaf-spot fungi, these are easily prevented from gaining entrance to the tissues of plants by keeping them well sprayed with Bordeaux mixture or other good fungicide.

The root rot and damp-off fungi—*Rhizoctonia*, *Ozonium*, *Agaricus melleus*, *Botrytis*, *Pythium*, *Fusarium*, etc., usually attack the plant through the roots or base of the stem, and cause a more or less rapid decay of the invaded tissues, followed by the starvation and death of the whole plant.

The cultivation of resistant individuals or the use of uninfected or sterilized soil and attention to general cultural conditions, especially rotation of crops, drainage, and aeration of soil, are the best preventive measures for diseases of this type.

In other cases stems and leaves may be invaded by fungi (rusts or smuts), but rotting or sudden death of the tissues does not occur. The plants may, however, be so reduced in vigor that they fail to mature. The cereal rusts, for example, often greatly reduce the yield of grain. In case of the smuts the grain is replaced by the spores of the fungus, but the plant is apparently not otherwise injured.

Hypertrophy.—In some cases the tissues attacked by fungi are stimulated to excessive growth. Finger and toe disease of turnip roots caused by *Plasmodiophora*, plum pocket and "leaf curl," "witches' brooms," etc., caused by

Exoascus, the large galls on *Vaccinium* and *Rhododendron* caused by *Exobasidium*, the large swellings produced on conifers by *Peridermium*, etc., are good examples.

Pathogenic Bacteria.—The casual relation of bacteria to numerous animal diseases has been the subject of much careful study, but until recently there were only a very few plant diseases known to be caused by these organisms.

Among the best known examples may be mentioned the "fire blight" of pomaceous trees, especially pear and apple. The tops of the trees are killed back as if burned by fire. The bacillus causing the trouble is carried from tree to tree by bees and other insects. The principal infection is through the nectaries of the flowers, and possibly, also, through the glands or water pores of the young leaves. The twigs are usually killed back for a few feet, then as the wood begins to mature the bacteria usually die, except where they have invaded a large limb or the body of the tree. To prevent the disease being carried over from season to season it is necessary only to find and remove all these latter sources of infection.

A bacterial disease of the English walnut on the Pacific coast is a serious menace to the culture of these trees. A bacterial gall or tumor of olive trees is serious in Europe, and has appeared in some of the olive groves of California. Among the bacterial diseases of vegetables may be mentioned the bacterial rot of the tomato, egg plant, and Irish potato, carried by biting insects, the brown rot of cabbages, and a bacterial disease of sweet corn entering the tissues through water pores in the edges of the leaves. Numerous other plant diseases have been shown to be due to bacteria, and the number will probably be greatly increased as the field is more carefully worked.

Diseases Caused by Animals.—Next to diseases of vegetable origin, those caused by animals, especially insects, are the most numerous and destructive. Many fungus and bacterial diseases are carried from plant to plant by insects; for example, pear blight by bees, potato rot by potato beetles, ferment and wood-rot fungi by boring beetles, etc. In the case of pear blight the bees, though they are carriers of the disease, are beneficial to the trees in aiding pollination. In other cases the injury caused by the insects may in itself be serious. The biting insects may in some cases cause more or less complete defoliation, or the sucking insects and mites may so reduce the stores of plant food as to seriously interfere with growth. Among the best known and most injurious of these are the scale insects, mealy bugs, plant lice (*Aphidae*), leaf hoppers, and the "plant bugs" (*Capsidae*). All of these feed on the sap of the plant by sucking it out of the tissues, but causing little or no mechanical injury to the cells. In many cases there is simply a general or local retardation of growth due to the removal of sugars and proteids; in other cases irritations are set up, possibly by some material injected into the tissues by the insect, resulting in gall-like swellings or various hypertrophied developments of the parts attacked, for example, *Phylloxera* on the leaves and roots of grape; woolly apple louse (*Schizoneura*) on roots of apple; *Colopha*, cockscomb gall on elm, etc. In other cases the growth of the tissue is checked, as where tis-

DISENTIS—DISINFECTANTS

sues are attacked by scale insects such as San José scale, and by many of the plant lice and leaf hoppers. In other cases growth is neither checked nor accelerated, but definite spots are produced which continue to enlarge, resembling a fungus or bacterial infection (*Stigmonose*) or puncture diseases, etc.

Borers may more or less completely ring a tree, cutting off the connection between root and leaves and thus resulting, in many cases, in death. Hypertrophy of tissues is also often the result of insect attack. Many insect larvæ developing from eggs laid in young tissues cause, by the irritations they set up, growths known as galls. Nematode worms attacking the roots of plants also cause gall-like swellings.

As in the case of the fungi, the complete life history and habits of any particular injurious insect must, as a rule, be determined before the greatest success in controlling it can be attained. Many insects have their natural enemies, which, if favored, may hold a serious pest in check. The development of natural resistance in plants by selection is also an important means of preventing injury in certain cases. And finally, the use of insecticides must be resorted to, as arsenic, etc., for biting and eating insects, and contact poisons for sucking insects.

ALBERT F. WOODS,
*Chief Pathologist and Physiologist, Bureau of
Plant Industry, Department of Agriculture.*

Disentis, Switzerland, a village in the canton Grisons, situated on the Hither Rhine. It is about $31\frac{1}{2}$ miles southwest of Reichenau, and 3,600 feet above sea-level. The monk Sigisbert, a disciple of Saint Columba, is supposed to have founded a large Benedictine monastery here in 614. Pop. (1900) 1,400.

Disestablishment, specifically the depriving a Church of its rights, position, or privileges as an established Church; withdrawing a Church from its connection with the State. A bill for the disestablishment of the Irish Church was introduced into the British House of Commons by Gladstone 1 March 1869. It was passed by Parliament within a few months of its introduction but did not take effect till 1 Jan. 1871.

Disfranchisement, the act of depriving a person of any privilege, liberty, franchise, or immunity, such as depriving a member of a corporation of his corporate rights. It is distinguished in this case from "amotion," which refers to the removal of an officer of the corporation from office, without affecting his membership. Another instance is the act of depriving a person of the rights and privileges of citizenship. This term is often applied to the act of depriving a citizen of the right to vote, and in Great Britain to the Act which deprives a constituency of the right to return a member to Parliament.

Dishonor, the refusal or omission of the drawee of a bill to accept, or of the acceptor of a bill, or of the maker of a promissory note to liquidate the obligation, on its maturity. There are generally three parties in a bill or note transaction, the holder, the drawer, and the person by whom the bill or note is payable, whether he be the maker or acceptor of it. In case the bill or note is dishonored, the holder must at once notify the endorser and the drawer,

if the paper be a draft or bill. Then the drawer, if there be funds of his in the hands of the drawee, will have an opportunity of withdrawing them. If a banker refuses to pay a customer's check, while holding an account of that customer sufficient to meet such check, he makes himself liable for damages.

Disinfectants, agents used for destroying or rendering inert the germs of infectious diseases. It has been amply proven that a large number of diseases are of microbic origin, and when these low forms of microorganisms are introduced into the body of susceptible individuals they multiply and thereby become capable of producing certain diseases, which are called infectious. Any agent capable of destroying these organisms is a disinfectant or germicide, and through disinfection we have a powerful and effective means of controlling these diseases and checking the spread of them.

In order to disinfect thoroughly, we must first trace the source of infection. In the eruptive fevers, such as measles, scarlet fever, smallpox, etc., the infectious agent comes directly from the body, attaching itself to the clothing, bedclothes, etc., and to objects handled by the infected person. The same is true of infectious skin-diseases, such as barbers' itch, ringworm, etc. In pneumonia, tuberculosis, diphtheria, and whooping-cough, the sputum and the breath take the germ of infection; in cholera, the alvine discharges, and possibly vomitus; in typhoid fever infection is largely due to the specific germ found in the discharges from the bowels; in malaria, anthrax, and elephantiasis, the germ is found in the blood; in hydrophobia it occurs in the saliva, spinal cord, and brain; in gonorrhœa, in the urethral discharges, etc. Some of the infecting agents do not multiply outside of the body, while others under favorable conditions are very procreative; therefore the object of disinfection is to destroy all infected material and, where this is not admissible, to subject it to a process of disinfection inimical to the life of the infecting germ. This must be complete and thorough. The selection of an appropriate disinfectant for each germ is the result of laboratory research. A culture of a germ is made in a medium best adapted to its propagation, and by experimenting with various agents one (or more) is found which proves most destructive to the germ, in the shortest possible time. The best and cheapest disinfectants known are supplied by nature, namely, sunlight and air.

Fire and heat are the most powerful disinfectants known. In the use of heat various kinds of mechanical apparatus for both dry and moist (superheated steam) heating are used. Boiling infected clothes, with or without the addition of a chemical disinfectant, is a popular means of disinfection. Where it is impossible to use either of these agents, gaseous elements are introduced. Cold (freezing) is a natural disinfectant, but fails in the case of typhoid germs, which have been known to resist freezing after 103 days; and the same is true of the tuberculosis germ. Camphor, medicated papers, or the burning of incense, may clear an odorous atmosphere impregnated with sewer-gas or fumes of decomposing animal or vegetable matter; but these are not disinfectants.

DISINFECTION — DISLOCATION

Of late the utility of disinfection has been forcibly demonstrated, and most cities and quarantine stations have established plants for steam disinfection. Clothing, bedding, etc., known or believed to be infected are placed in chambers or cylinders and subjected to a pressure of superheated steam (220° to 230° F.) for 20 or 30 minutes. This thoroughly disinfects all infected material. Dry heat is not so effective. The ideal disinfectant for all practical and domestic purposes, both inexpensive and easy of application, is chloride of lime in the proportion of six ounces to a gallon of water. All typhoid or cholera stools, likewise the sputum of pneumonia or tuberculosis patients, are rendered innocuous by it in less than 30 minutes. Carbolic acid in the proportion of four ounces to a gallon of water will destroy most bacilli, but not their spores. It is highly poisonous, and very destructive to the skin, therefore to be used with caution. Corrosive sublimate, in proportion of one part to 1,000 parts water, is not only an efficient disinfectant, but a powerful insecticide as well. It can be applied to wood-work, walls, floors, etc., but its corrosive action on metal renders its uses limited on sewers, drains, and the like. Milk of lime or common whitewash, so highly recommended by the German government in the cholera epidemic of 1892, is a ready and efficient means of disinfection. This may be prepared by sprinkling a quart of quicklime in a suitable vessel and, when the lime is reduced to a powder, adding three or more quarts of water, allowing the mixture to stand. It may then be applied with a brush to walls, floors, etc. Drains are flushed, and all excreta from infected cases treated with equal parts of lime solution.

The use of chlorine and sulphurous gases is objectionable because of their irritating qualities. Sulphur fumes are falling into disuse, in consequence of the foul odor and failure to accomplish the end sought. A more modern disinfectant is made by subjecting methyl-alcohol to oxidation, and is commonly known as formalin. It is readily soluble in water, does not destroy clothing or furniture, and is virtually non-poisonous. It is used in the preservation of meat and food, for disinfecting surgical instruments, for the washing out of sinuses and of indolent and foul ulcers, and for the disinfection of dwelling-rooms. Solid formaldehyde being introduced into a generator and burned, the resulting gas quickly penetrates all cracks and crevices, and renders the air clean and pure, besides destroying all infectious germs.

Most of the metallic and acid disinfectants are more or less objectionable on account of their destructive action to the skin and tissues. Permanganate of potash, osmic acid, bromine, and iodine are useful in their respective places. In all cases of infectious or contagious diseases disinfection should be complete; articles infected should be burned, boiled, or disinfected, and not buried or thrown into sewers before being treated with a proper disinfecting agent, for infecting germs have been known to lie dormant for years.

Disinfection, popularly speaking, the process of destroying infectious organisms. Various modes of general disinfection have been in use for a number of years, most of which are extremely crude and inefficient. It is be-

coming recognized more and more that a general mode of procedure for dealing with infectious organisms is of very little value, and it is becoming more and more evident that individual disinfection for each and every type of disease-producing organism is necessary. Thus the old-fashioned mode of disinfection in yellow fever, by means of steam, heat, chlorine gas, sulphur, etc., are shown to be absurd in the light of modern knowledge, as yellow fever is conveyed by means of mosquitoes, and as the knowledge concerning the cause of infectious diseases is becoming more and more definite, the means of preventing the spread of such diseases by proper disinfectants is taking on a more individual character. In any application of the principle of disinfection the first question necessary to ask is, by what agents and through what channels is a given disease propagated? Thus in diphtheria, it may be vastly more important to cleanse the throats of all persons who have come in contact with a diseased patient, than it would be to burn barrels of sulphur in a room where a sick child had lived. In typhoid fever it is now well recognized that the bacillus of the disease is eliminated in the feces and in the urine, and that flies and small animals are capable of carrying about on their feet the micro-organisms. Therefore if one would properly disinfect a typhoid fever patient, it is necessary to take great care with the feces and urine and other excreta, and, as far as possible, exclude all insects from the room. Of the value of general disinfectants, such as the burning of sulphur in a room, or the use of formaldehyde gas, or the cleaning out of ships and railway cars by aerial disinfectants, the writer believes them to be generally inefficient.* In this encyclopedia individual prophylaxis against contagion is described under each infectious disease, and can best be consulted in its proper place. See ANTISEPTICS; BACTERIA; DISEASE; GERMICIDES; INFECTIOUS DISEASE.

*The best disinfectants are fresh air and sunlight. Steam, boiling water, and burning are the best means of cleansing clothing. Formaldehyde gas is one of the best means of ridding a large room from noxious insects, and as a general disinfectant.

Disintegrator, a machine in which various substances are pulverized or crushed by beaters projecting from the faces of parallel metallic disks revolving in contrary directions. There are disintegrators for ore and for grain, and one form is used for mixing mortar.

Dislocation, the displacement of one bone from another with which it forms a joint. Thus by dislocation a limb is said to be put out of joint. Dislocations are the result of either disease, accident, or congenital malformation. The displacement may be either partial or complete, and cases are classified as simple, when the skin remains unbroken, and compound where a wound lays bare the bone; when a fracture of the bones, and injury to important blood vessels aggravates the case, the dislocation is said to be complicated.

The general treatment of dislocations consists in reduction, that is, drawing back the displaced joint into its socket. The contracted muscles oppose this reduction, and sometimes their spasmodic action has to be overcome by the administration of chloroform or ether. Up to the year 1870 or thereabouts the reduc-

DISLOCATION — DISPERSION

tion was generally effected by extension, that is, by pulling out the displaced limb, and stretching the restraining muscles until they are exhausted, when the bone would generally slip back into its place with an audible snap.

Of late years, however, reduction by extension has been to a very large extent given up in consequence of the general adoption of reduction by manipulation. This method, known it seems from ancient times, but curiously neglected, consists in executing certain complex movements of the dislocated limb which effect the return of the displaced bone to its socket by ingeniously utilizing its unruptured attachments and evading the opposition of the muscles, by fraud rather than by force. It is particularly applicable to the hip, which, as it is commanded by the strongest mass of muscles in the body, always presented the most formidable obstacles to the old method. The first paper on this subject which attracted general attention was by Dr. Reid of Rochester, N. Y. (1851); and in 1869 Prof. Bigelow of Boston published a careful and exhaustive discussion of injuries to the hip, with such full and clear directions for the manipulation method, as to secure its general adoption in the case of this joint by surgeons in Great Britain as well as in America. The method, however, had been described and used in France and elsewhere, though with less care and precision, in the earlier half of the 19th century.

In cases of congenital dislocation of the hip bone and other congenital misplacements of the bones, manipulation, intensified into powerful massage, has been developed practically to a wonderful extent by Dr. Adolf Lorenz, an Austrian surgeon who has lately visited this country. See LORENZ, ADOLF.

Dislocation (in Geology). See FAULT.

D'Isly, Duke. See BUGEAUD, THOMAS ROBERT.

Dismal Swamp, Great, a tract of marshy land, beginning a little south of Norfolk, Va., and extending into North Carolina; containing 150,000 acres; 30 miles long, from north to south, and 10 miles broad. This tract was entirely covered with trees, with almost impervious brushwood between them, but it has now in part been cleared and drained and is devoted to agriculture. In the midst of the swamp is Drummond's Lake, seven miles in length, the scene of Thomas Moore's 'Lake of the Dismal Swamp.' In 1899, the Dismal Swamp canal, connecting Chesapeake Bay with Albemarle Sound, which from about the beginning of the 19th century to the close of the Civil War was a famous historic waterway, was reopened for navigation. It extends from the village of Deep Creek, Va., to South Mills, N. C., a distance of 22 miles; and is one of the most important links in the chain of inland waterways extending along the coast from New York to Florida. A marked advantage of the restored canal is that it enables shipping to avoid the dangers of Cape Hatteras; another is that it will furnish the means of inland and protected navigation for the smaller vessels of the navy and the revenue service. Although only 22 miles long it opens up 2,500 miles of inland navigation. The improvement of this canal cost the United States government nearly \$1,000,000. Little Dismal and several smaller swamps are

along the coast of North Carolina; area, about 2,000,000 acres.

Dismas, Saint, according to ancient legends, based on doubtful authority, the name of the penitent thief who died on the cross beside Jesus Christ.

Dispart', the difference between the semi-diameter of the base ring at the breech of a gun and that of the ring at the swell of the muzzle. On account of the dispart the line of aim makes a small angle with the axis, so that the elevation of the latter above the horizon is greater than that of the line of aim. In modern guns the dispart is of little practical consequence on account of the present placing of the sights.

Dispensary is literally a place where medicine or food is weighed out for distribution; in our own day the term is applied to a charitable institution where medical and surgical aid are given without charge to those who desire or need them. Such dispensaries are found in most large towns of the United States and Europe. In the Old World they originated in the monasteries. The Royal General Dispensary, Bartholomew Close, London, is the oldest dispensary in England and was founded in 1770. The oldest in the United States was opened in New York in 1795.

Dispensa'tion, in canon law, is the relaxation of a law in a particular case: it is an act for which the lawgiver is competent as regards laws enacted by himself or by his predecessors to whose powers he succeeds. It is claimed for the Supreme Pontiff that he can dispense in matters where the *jus divinum* springs from a human act of will, as in vows and promissory oaths (Liguori): in such case casuists hold that the Pope does not do away with the *jus divinum* but removes the ground of the obligation of oath or vow: in the words of Aquinas, "He determines what is pleasing to God." The claim of power in the Pope to do this rests on the power granted to St. Peter, of loosing and binding. Bishops by their ordinary power can dispense from the laws and statutes of their own diocese, and from general laws of the Church by virtue of powers delegated by the Pope, as in most vows and in the laws relating to fasts, abstinences, observance of holidays, etc.

Dispensatory, a work of reference, concerning itself more particularly with the subject of materia medica and therapeutics. Dispensatories are not official volumes, such as pharmacopœias. They represent solely the opinions of scholars who are hired by publishers to issue at more or less regular intervals such works of reference. They are usually encyclopædic in character. At the present time there are two recognized dispensatories widely in use in the United States, the 'National Dispensatory' and the 'United States Dispensatory.'

Dispenser, dē-spēn'sēr, Hugh le, English jurist: b. about 1210; d. Evesham 4 Aug. 1265. He was justiciar of England in 1261 and during the war of the barons with Henry III. joined the former. He was killed at the battle of Evesham.

Disper'sion, an optical term applied to the angular separation experienced by the component rays of a pencil of light on emerging from a refracting medium, whose surfaces are not

parallel to each other, as in the case of the common prism. The refractive index of a transparent medium is different for different kinds of light. Thus, when white light passes through a given prism, the rays of different refrangibility of which it is composed are bent by different amounts from their original common direction. They are said to be dispersed. The dispersion for the given prism depends upon the difference of the refractive indices of the extreme rays of the visible spectrum. It varies with the substance and the angle of the prism. The relative breadth of any two parts of the spectrum varies with the substance of the prism. This constitutes the so-called irrationality of dispersion. In general, rays of short wave-length are more refracted than rays of long wave-length, but in some refracting media this law breaks down in part. This is known as anomalous dispersion. The term false dispersion is applied to the scattering of light by reflection from motes suspended in a transparent medium. See LIGHT.

Displayed, a heraldic term used to describe the position of an eagle or other bird with its wings expanded.

Dispossess, in law, to put out of possession, to dislodge and evict; to deprive of actual occupancy, particularly of real property. Dispossess *proceedings* are begun against a tenant who is then served with a dispossess *warrant*, and ejectment from the premises follows. See EJECTMENT AND EVICTION.

Disraeli, dīz-rā'li, Benjamin. See BEACONS-FIELD.

D'Israeli, Isaac, English author: b. Enfield, Middlesex, May 1766; d. Buckinghamshire 19 Jan. 1848. His father, Benjamin D'Israeli, was the descendant of a family of Spanish Jews which had settled at Venice in the 15th century to escape the persecutions of the Inquisition. In 1791-3 appeared his 'Curiosities of Literature,' the most entertaining of his works, and that by which he is best known at the present day. Its success was such as to determine D'Israeli to pursue the same path through the literary field, the collection of instructive and amusing gossip relative to literary men and their writings. From this period up to 1812 he appears to have been principally engaged in the collection and preparation of literary materials, the results of his labors appearing in the following works, published between that year and 1822: 'Calamities of Authors'; 'Quarrels of Authors, or Memoirs of Literary Controversy'; and 'Inquiry into the Literary and Political Character of James I.' These were afterward published collectively under the title of 'Miscellanies of Literature.' In 1828 appeared the commencement of his 'Life and Reign of Charles I.,' a work completed in 1831. In 1841 appeared his 'Amenities of Literature.' D'Israeli was a man of a pensive and solitary turn of mind, and his life was quite that of a literary recluse, spending the greater part of his time in his library. A memoir of him, prefixed to a new edition of his 'Curiosities of Literature,' was published by his son, Benjamin Disraeli, afterward Earl of Beaconsfield (q.v.).

Disruption, the name commonly applied in Scotland to the act by which, in 1843, about 400 ministers gave up their livings to vindicate principles which they held to be essential to the

purity of the Church, and in harmony with its earlier history. They held themselves at liberty to return when the Church which they had left had abandoned the opinions on civil and ecclesiastical government which had caused the rupture. See FREE CHURCH.

Dissection, the process of studying the parts or organs of animals or plants by cutting or tearing operations. Practically, no complete knowledge of the structure of organized bodies can be obtained in any other way than by complete dissection, and in human anatomy its place in the curriculum is most important. The dissection of human bodies in the study of anatomy has probably taken place as long as we know the history of civilization; although, in certain countries and at certain ages, the practice of human dissection has been forbidden by certain ruling classes,—at one time the Church, another time the state, another time the aristocrat, at another time public opinion. At the present time, however, dissection of the dead body is recognized to be a prime essential to the study of medicine, and throughout all civilized countries it is widely practised.

Dissection Wounds, wounds made by cutting instruments, during the process of dissection, which differ from ordinary wounds of accidental origin, largely in their greater liability to become infected by pus-producing bacteria. The human body after death makes an excellent host for a number of these septic organisms, notably the staphylococci and streptococci. It is by the entrance of these usually present organisms into the wounds that this ready infection takes place. Often dissection wounds prove fatal by the extension of the infection, with resulting blood poisoning. Great care should be taken by all students of anatomy as well as by undertakers and their assistants in order to avoid accidents of this kind. See SEPTICÆMIA.

Disseizin, dis-sē'zīn, or **Disseisin** (Fr. *dessaisir*, to disseize, deprive of), is the dispossessing one of a freehold estate, or interrupting his seisin. Under the feudal law, when a vassal was admitted to an estate by the ceremony of investiture, he was said to be seized of it. The disseizing of him was the turning him out of his fee. This term is synonymous, in modern law, with "adverse possession." There is also what is called in law disseizin by election, when a property holder chooses to consider himself disseized of certain real estate, in order to avail himself of remedies at law applicable only to a disseizee.

Disseminated Sclerosis. See MULTIPLE SCLEROSIS.

Dissenters, the common name by which in Great Britain all Christian denominations, excepting that of the Established Churches, are usually designated, though in acts of Parliament it generally includes only Protestant dissenters, Roman Catholics being referred to under their specific name. The most important bodies of English dissenters are the different bodies of Methodists, the Congregationalists, and the Baptists; and of Scotch dissenters, the United Free Church. The term nonconformists is often used as synonymous with dissenters. For its historical significance, see NONCONFORMISTS.

Dissepiment, a division of the ovary; a true dissepiment is formed when the carpels are

DISSOCIATION

so united that the edges of each of the contiguous ones by their union form a septum. Each dissepiment is formed by a double wall of two laminae: when the carpels are placed side by side, true dissepiments must be vertical and not horizontal. A spurious or false dissepiment is formed when the divisions are not joined by the union of the edges of contiguous carpels. They are often horizontal, and are then called phragmata. In the Cruciferae they are vertical.

Dissociation, in chemistry, is the resolution of a substance into other substances, whose molecules have a simpler constitution; but the word is usually applied only to those reversible resolutions in which the secondary products are capable of recombining to form the primitive substance, when the conditions that led to the dissociation are removed or reversed. Dissociation is therefore to be contrasted with "decomposition," for the latter word is used without any implication as to the subsequent behavior of the products into which the primitive substance is resolved. Dissociation, in the usual sense of the word, is induced directly by the application of heat, and many cases of it have been exhaustively studied. Calcium carbonate may be taken as an example. When this substance is heated in a closed vessel it parts with a portion of its carbon dioxide and becomes reduced to a mixture of calcium oxide, calcium carbonate, and free carbon dioxide gas. The decomposition proceeds only up to a certain limit, however, and if (as in "burning" limestone for the production of quicklime) it is desired to reduce the carbonate of calcium entirely to the form of the oxide, it is necessary to provide for the removal of the carbon dioxide gas. If the operation be carried out in a strong closed vessel which contains nothing but calcium carbonate, calcium oxide, and carbon dioxide, the decomposition proceeds only until the liberated carbon dioxide attains a definite pressure called the pressure of dissociation, which is always the same for the same temperature, and bears no relation to the quantity of calcium carbonate that is present, provided some quantity of it (no matter how little) still remains. Sir James Hall showed, many years ago, that when calcium carbonate is confined in this way it may even be fused without undergoing decomposition to any considerable extent. The explanation of these curious facts is, that the carbon dioxide is continually combining with the calcium oxide in certain parts of the vessel with the production of calcium carbonate, while in other parts of the vessel the calcium carbonate is simultaneously dissociating into free calcium oxide and free carbon dioxide. The recombination proceeds with a velocity that is proportional to the density of the free gas, while the dissociation proceeds with a velocity which, for the purpose of illustration at all events, may be regarded as constant. It follows that at low densities of the gas the dissociation will proceed faster than the recombination, the result being that the density of the free gas will increase. But this will also cause the recombination to proceed faster, and finally, when the density of the gas reaches a certain critical value, the recombination and dissociation will proceed with equal velocity, and a state of apparent equilibrium will be attained. No further visible decomposition of the carbonate will take

place, unless the equilibrium is disturbed by the removal of some of the carbon dioxide (in which case the dissociation will again proceed until the same critical density of the free gas is restored), or by a further increase of temperature (in which case the dissociation will proceed until the density of the gas attains to a new critical value, higher than the first one, and whose value depends upon nothing but the new temperature to which the system has been raised). Reactions such as the one here described thoroughly refute the old doctrines of chemical affinity, which taught that two substances either will or will not combine under given circumstances, according as the chemical "affinities" of the constituent elements would be more or less thoroughly "satisfied" in the possible new compound than they are in the separate substances that might combine to produce that compound. In the case considered above, combination and decomposition go on simultaneously, and the only question is, which of the two will proceed the faster under given conditions. (See *EQUILIBRIUM, CHEMICAL*.) The quantitative study of the phenomena of dissociation is beset with difficulties, for the extent of the dissociation cannot be ascertained with satisfactory precision in all cases. The products into which the primitive substance is resolved are (by the definition of dissociation) capable of recombining when the conditions that lead to the dissociation are removed. Hence it is by no means easy to determine what proportion of a compound is dissociated under given circumstances. When (as in the case of calcium carbonate) the primitive substance and one dissociation product are solid, and the other dissociation product is gaseous, the extent of the dissociation may be inferred by computing the mass of the free gas, from observations of its volume, pressure, and temperature. When the original substance and the products of dissociation are all gaseous, the problem becomes exceedingly difficult, and special means must be devised to fit each special case. In the case of nitrogen tetroxide, N_2O_4 , which dissociates into the oxide NO_2 , the degree of dissociation may be inferred optically, since N_2O_4 is nearly colorless, while NO_2 has a pronounced brownish-red color. In other cases, the extent of the dissociation may be inferred from observations of the vapor density of the mixture. This method has been used quite successfully in the case of iodine, the vapor density of this element indicating a molecular formula of I_2 at temperatures below $700^\circ C.$, and I at temperatures above $1,500^\circ C.$; while at intermediate temperatures the vapor is a mixture of I and I_2 . The dissociation of acetic acid vapor has been studied by the vapor density method, and also by observing the specific heat of the mixture at different temperatures, the specific heat being assumed to be greater (on account of the work done in separating the molecules) as the dissociation proceeds than it is before the dissociation begins, or after it is complete.

Certain compounds (such as sodium chloride) appear to be more or less completely dissociated when they are dissolved in water; but the constituents into which they are resolved possess certain distinctive properties that are not manifested by the resolved parts of substances that are dissociated by the action of heat. For this reason it is now usual to dis-

DISSOLUTION — DISTEMPER

tinguish this particular phenomenon by a special name, and the dissociation that occurs in such cases is called "ionization." See ELECTROLYSIS; SOLUTION.

Dissolu'tion, the resolution of any body into the smallest parts by chemical agency. In English politics, the act of dissolving or putting an end to the existence of a Parliament. It differs from a prorogation, which is the continuance of a Parliament from one session to another, and from an adjournment, which is its continuance from one day to another. A dissolution is the civil death of a Parliament; and this may be effected in three ways: (1) By the will of the sovereign. (2) By the demise of the crown. This dissolution formerly happened immediately upon the death of the reigning sovereign, but it being found inconvenient to call together a new Parliament immediately on the inauguration of the successor, and dangers being apprehended from having no Parliament in being in cases of a disputed succession, it is provided by several statutes that the Parliament in being shall continue for six months after the death of any sovereign, unless sooner prorogued or dissolved by the successor. (3) A Parliament may be dissolved or expire by length of time. As the constitution now stands the Parliament must expire, or die a natural death, at the end of every seventh year, if not sooner dissolved by the royal prerogative.

Dissolving Views, paintings upon glass magnified and thrown with great distinctness upon a screen by means of one or two magic lanterns with strong lenses, and illuminated by the oxyhydrogen light. If one lantern is used the picture is drawn out of focus gradually, and a second substituted, which is brought gradually into focus, thus producing the haze and brilliancy which have gained this sort of exhibition its name. If two lanterns are used, they are placed side by side with their lens tubes slightly convergent, so that the images may be superposed on the screen. An opaque rectangular shutter, capable of revolving vertically upon a pivot fixed midway between the lanterns, is placed before the lenses in such a position that, when horizontal, it cuts off one half of the pencil of light from each lens. When this shutter is made to revolve through a small arc, it shuts off the whole of the pencil of light from lantern No. 1, allowing that from No. 2 to pass unhindered. When the shutter is in this position the image from No. 2 falls on the screen in full distinctness; but when the shutter is made to revolve in the opposite direction, the image from No. 1 will be gradually disclosed, as that of No. 2 becomes concealed.

Dis'sonance (Lat. *dissonantia* — *dissonare*, to sound harshly). A word in music wrongly supposed by the general public to mean the same as discord (q.v.). Technically, it is a sound of two or more tones struck together which are at variance with the formation of a common major or minor chord. Thus it is an interval, one or both of whose members must move in a certain way to satisfy the ear — demanding resolution into consonance (q.v.). If the dissonance is minor or major one member only is compelled to move. If augmented or diminished both members must move, toward each other if the interval is diminished, and contrary if augmented. All augmented and di-

minished intervals, seconds, sevenths, and ninths are dissonances. Dissonance, however, disregards all limitations, and it is next to impossible to form rules to govern it. In recent years especially, it seems to have become a law unto itself, and appears reaching out for a new science of sound outside of natural harmony. As witnessed in the work of the new school of composers, with such men as Richard Strauss and Edward Elgar for leading exponents, it wields a new and strange power which may revolutionize the tonal world. To demonstrate the progress of dissonance in modern music it is only necessary to cite the very important part the "fifth" plays to-day even in compositions of conservative musicians. Thirty years ago this interval ("fifth") was abhorred by theorists and looked upon as an abomination. See ACOUSTICS; CHORD.

Dis'taff, the earliest instrument of spinning, a staff, on one end of which the wool or flax was rolled. The spinner held it in the left hand, and drew out the fibres with the right, at the same time twisting them. A spindle was attached to the thread, the weight of which carried down the thread as it was spun. When the spindle reached the ground the thread which was wound round it was then again fastened near the beginning of the new thread. The 7th of January is called St. Distaff's Day, because it marks the return of the women to their usual household duties, after the revels of Twelfth Day.

Distem'per, a disease of the dog commonly considered as of a catarrhal nature. In most cases a running from the nose and eyes is one of the first and chief symptoms. This defluxion becomes after some time mucous and purulent, loading the eyes and obstructing the nostrils; and whenever the animal is subjected to a draught of air, or excitement of any kind, it has violent fits of coughing combined with vomiting, it soon begins to lose appetite, its flesh begins to waste, and it becomes listless and irritable. If the disease be virulent, symptoms of affection of the brain manifest themselves, accompanied by fits, which come on especially at the sight of another dog, or by convulsive twitchings, resembling St. Vitus' dance. In such cases the dog is often supposed to be mad, and frequently destroyed in consequence. Inflammation of the lungs is not an infrequent consequence of the disorder, and the bowels are more or less affected by diarrhœa and dysenteric discharges. Protracted cases are attended by eruptions on the chest and abdomen, and the surface of the body becomes of a yellow hue. These are always fatal symptoms. In the first stage of the disease laxatives, emetics, and occasional bleeding are the principal remedies; diarrhœa should be checked by astringents, and to reduce the violence of the fits warm bathing and antispasmodics should be resorted to.

Distemper (from O. Fr. *destemprer*, Mod. Fr. *détrempe*, Ital. *tempera*), in painting, a preparation of opaque color mixed in a watery glue, such as size, white of egg, or glue. It is used now chiefly in scene painting and in paper for walls, but was employed in the higher departments of art before the establishment of oil or varnish painting in the 15th century.

DISTICH — DISTILLATION

Distich, dis'tik, a couplet of verses. No form is more suitable for maxims or sentences than the distich.

Distillation is a technical process which results in the separation of a volatile from non- or less volatile components contained in a closed vessel (still, pot or retort), and their conversion, by the application of heat, into vapors, and subsequent condensation to the liquid state. The liquid obtained by distillation is called the distillate, and the remainder is the so-called distillation residue. When water is heated to 100° C. (212° F.), at ordinary atmospheric pressure, it boils and is converted into steam. If this generated steam is conducted through a pipe, around which cold water flows, it will again be transformed to a liquid. In the distillatory apparatus this appliance is called the condenser. The obtained liquid is collected drop by drop in a receiver. The entire process is called distillation, from the Latin word *destillare*, meaning "to drop." Accordingly the essential features in a simple distillatory apparatus are:

1. The still, pot, or retort, that is, the receptacle for the material to be distilled. In accordance with its nature, this material is heated to that temperature at which the products are volatilized.

2. The condenser, by means of which the distillates are condensed.

3. The receiver, which collects the products of distillation in a liquid state.

When distillation is properly conducted, many liquids, as for instance, water, can be purified.

Distillation of Water.—Pure water is never found in nature, as it generally contains salts and other mineral substances, organic matter, and decomposition products, partly volatile, and partly non-volatile. The non-volatile components are readily separated by distillation. Inasmuch as the former are mostly very volatile, they are received in the very first distillate of the water, so that it is customary to reject this first portion. Experience has taught that pure water is obtained by distilling three fifths of the entire amount, and rejecting the first one fifth. In some special cases, where a water has many volatile impurities which can be detected by its appearance, odor, and taste, the distillation might be rendered more difficult, as it becomes necessary to add certain chemicals to the water in order to combine the volatile components and to transform them into non-volatile bodies. The purifying of water by means of distillation, or, in other words, the preparation of distilled water, is of much practical value. In the pharmacy, in the chemical laboratory, and in many chemical industries, distilled water is an indispensable article. The transformation of the salt water of the ocean into a potable water, by means of distillation, is also of inestimable value. Pure distilled water, however, has an empyreumatic odor, and a repulsive flat taste. According to the most recent medical investigations, pure distilled water, when constantly used, is, on account of its very purity, deleterious to health. It is claimed that this water possesses high solvent properties and also absterges the mucous membrane of the stomach too much. For this reason, the odor of the water is improved by thorough aëration or carbonization, and it is made potable by the addition of pure

salt or sugar, or any other desired substance. The large ocean steamers have an equipment for producing a potable water from the sea water. The fundamental elements in this apparatus are a steam generator or evaporator, in which the sea water is vaporized by means of superheated steam, which is obtained either from a special boiler or directly from the engine boilers; a condenser combined with an aëerator; and a refrigerator, with which, in many cases, a filter is combined. Special constructions of this style are those of Chaplin, Rocher, Dr. Normandy, Gallé, Mazeline, Perroy, and Hocking, in which simplicity of construction and the economy of coal are the main essentials. In recent times many ships supply themselves with an especially good well water for drinking purposes, while for cooking, washing, and boiler feeding, they distil the sea water as it is required. For these latter purposes carbonating and aërating are of course unnecessary. In most cases the evaporator is directly connected with the ship's engine. The sea water which is to be evaporated is taken from the water cooling the condenser, while the steam is obtained from the steam-jacket, or an intermediate compartment of the engine. In this way, the cylinder is constantly drained and supplied with fresh steam. The most common of these constructions are those of Yarian, Pape & Henneberg, Howe & Beckwith, Pamphlet & Ferguson. The distil constructed by Jones utilizes the escaping gases for heating the water, so that the entire apparatus is situated in the chimney. In general, the distillation of water is very simple, because it is a liquid which has a constant boiling point. More heat in the distillation process simply occasions more rapid evaporation. The departing steam, unless it is heated in a special apparatus, as is done in the case of superheated steam, retains the boiling point temperature until it is cooled.

However, it is different with a mixture of various vaporizable liquids, each of which has a definite boiling point. According to the predominance of one or the other liquid, the mixture will have a varying boiling point. When the vapors passing over at different intervals are separately condensed, it is possible to obtain single components from the mixture, provided, of course, that the various components of the mixture radically differ in their boiling points. This special method of distillation is called fractional distillation.

The best-known distillation process is the separation of water and alcohol, or, in other words, the concentration or rectifying of alcoholic solutions, by means of distillation. This is a special branch of modern industry and is also a valuable source of revenue to the State.

Distillation of Spirits.—The boiling points of water and alcohol differ considerably. At normal pressure water boils at 100° C. (212° F.), while alcohol boils at 78.4° C. (173.5° F.). Consequently, it is evident that the boiling point of a mixture of water and alcohol will range between 173.5° F. and 212° F. In proportion to the predominance of alcohol, the boiling point will be lower, and as the alcohol vaporizes, the boiling point will rise until, finally, pure water is distilled at 212° F. If a dilute mixture of water and alcohol [the mash in the American distillery usually contains 5 to 10 per cent alcohol by volume (10 to 20 proof)] is distilled in a simple distilling apparatus consisting of a pot,

DISTILLATION

or still, and a worm, dilute alcohol is always obtained, and the smaller the quantity of alcohol contained in the mixture, the greater proportionately will be the amount of alcohol contained in the distillate, as is shown in the following table of Groening:

Percentage of alcohol in the boiling mixture		Boiling point		Percentage of alcohol in the vapor	
Volume	= proof	Centigrade	Fahrenheit	Volume	= proof
1.....	2	98.75	209.7	13.....	26
3.....	6	96.25	205.2	36.....	72
5.....	10	95.00	203.0	42.....	84
7.....	14	93.75	200.7	50.....	100
10.....	20	92.50	198.5	55.....	110
20.....	40	87.5	189.5	71.....	142
30.....	60	85.0	185.0	78.....	156
40.....	80	83.75	182.7	82.....	164
50.....	100	82.5	180.5	85.....	170
60.....	120	81.25	178.2	87.....	174
70.....	140	80.00	176.0	89.....	178
80.....	160	79.38	175.2	90.5.....	181
90.....	180	78.75	173.7	92.....	184

If the distillate obtained from a dilute mixture of water and alcohol is redistilled, a distillate containing more alcohol is obtained. Thus in four distillations of a mash having 10 per cent alcohol by volume (20 proof), a raw spirit 80 per cent alcohol by volume (160 proof) is obtained, in which the

first distillate contains 28 per cent alcohol by volume,
= 56 proof.

second distillate contains 50 per cent alcohol by volume,
= 100 proof.

third distillate contains 70 per cent alcohol by volume
= 140 proof.

fourth distillate contains 80 per cent alcohol by volume,
= 160 proof.

Of course, we assume that each time the distillation is carried out completely.

Formerly, it was necessary to repeat the distillation several times, in order to obtain a highly concentrated alcohol. The first weak distillate with less than 20 per cent alcohol by volume was called Lutter. It was used for the further concentration of the alcohol. This method of concentrating alcohol was called doubling or rectification, but as this repetition was tedious and consumed much time and fuel, a shortening of the distillation process was eagerly sought for, and with the aid of suitable appliances it has now become possible to introduce a complex, separatory distillation in one operation.

The following principle is standard for the construction of distillatory apparatus. If the concentrated alcoholic vapors developed at the boiling of the alcohol-water mixture are not cooled directly to the temperature of condensation, but only a few degrees, then a greater part of the less volatile liquid, that is, water, is condensed than of the more volatile alcohol. Through this partial cooling, the remaining vapor accumulates more alcohol. This process is called dephlegmation and denotes a draining of the alcohol, as the older chemists designated the water as a component of spirit by the word "phlegma." Accordingly, the more recent apparatus in larger distilleries, in which highly concentrated alcohols are manufactured, are equipped with a dephlegmation and rectification appliance, in direct connection with the still, so that it has become possible in the column apparatus of to-day, with continual operation, to produce, from the fermented mash, a high

wine free from fusel, containing 90 to 95 per cent alcohol by volume (180-190 proof).

According to the capacity of the plant, and, especially according to the kind of product, various apparatus are used in the distillery; but an enumeration here of these would lead too far,

while their description properly belongs under special heads. Therefore only the main types of various distillatory apparatus are mentioned here:

1. Simple stills, with worm condenser heated by direct firing.

2. Simple stills, with closed washwarmers, in which the mash is previously heated by the latent heat of vaporization.

3. Double pot-stills, generally consisting of two superimposed stills. While the mash in the lower still is being deprived of its alcohol, the mash in the upper still is enriched with alcohol and heated by the vapors of the lower mash, until the latter after sufficient concentration is heated to the boiling point. From this time on alcoholic vapors develop in the upper pot which are cooled in a dephlegmator and absorb still more alcohol. The concentrated vapors pass over into the condenser, while the condensed liquid flows back into the upper still. Such apparatus are either heated by direct firing below the lower still, or by means of steam, which is introduced into the lower still.

4. Two, three, or more chamber charge-stills, with or without charging chamber in one apparatus, in which the single compartments are placed one over the other, and the heat from the lower serves to enrich the one above. Steam is used for heating.

All these apparatus, when heated by direct firing, are made either of copper or iron, when heated with steam are made of copper, but oftentimes made of wood, such as heavy cypress or white oak. These are more suitable for intermittent working, and are mostly used in distilleries which distil rye, whiskey, etc.

5. Continuous pure still apparatus (on account of their form called column apparatus), which are mainly used in larger distilleries, can be regarded as a combination of a larger number of small stills, in which the mash, continuously flowing from the upper compartments to the lower, constantly comes in contact with steam flowing in the opposite direction. Through this countercurrent, the rising vapors become more rich in alcohol, through the dephlegmation and rectification taking place in each of the compartments, while the mash flowing downward is constantly deprived of its alcohol until it flows from the lowest chamber as slop, free

DISTILLATION

from alcohol. The concentrated alcoholic vapors, escaping from the uppermost chamber of the column, are then liquefied in a condenser when alcohols of only moderate strength (125 to 150 proof) are to be produced; but, if very pure highly concentrated alcohols are to be manufactured, these vapors pass over into a similarly constructed rectification column, where they meet with the liquids (lutter or phlegma), returning from the dephlegmator or condenser. The vapors take up alcohol from the liquids and pass from the upper chamber of the rectifier into the dephlegmator, in which a continual countercurrent between the condensed liquids constantly takes place.

These continual apparatus are improvements of the apparatus of Coffey, which are much used in England and Scotland; Savalle, an improvement of which is used in France; of Pistorius, Ilges, Siemens, Bohm, and others. The advantages of the continual column apparatus in comparison with the simple pot-stills, are, that the mash is more quickly vaporized, that the expense for fuel is diminished and that, as a rule, a more highly concentrated product is obtained. But, on the other hand, they also require more care and attention and skilled operators. They are also more difficult to construct (therefore it is advisable to place an order with a first-class reliable firm). Besides there is a possibility that alcohol might sometimes pass off with the slop. In the simple stills this possibility is considerably reduced, so that it is still advisable for small distilleries to erect good pot-stills, because they mostly manufacture alcoholic liquors with about 50 per cent alcohol by volume (100 proof).

The alcoholic liquid obtained in the distillery with the best modern apparatus contains, besides the highly concentrated alcohol (96 per cent by volume, 192 proof), more or less fusel oil, by which the admixture of various substances besides water is meant. Up to the present time, the following impurities contained in 50 to 95 per cent alcohol by volume have been determined; acetic aldehyde, propylic alcohol, isopropylic alcohol, butylic alcohol, acetic ether, butylic ether, acetal, secondary amyl alcohol, isoamyl alcohol, isobutyl alcohol, furfural, and various amines. In the corn and potato spirits amyl alcohol is in predominance, and therefore it is briefly called fusel oil. Technically, fusel oil is not a uniform substance, but the higher boiling part of the impurities accompanying the alcohol distillation.

Very little is known about the origin of these substances. Their presence might be due to secondary fermentations which are produced by fission fungi, schizomycetes, but the yeast itself may also have a certain influence, as certain yeast species are capable of producing fermentation products of a definite aroma and taste. For example: *Saccharomyces ellipsoideus* produces a peculiar fruit bouquet. It is well known that aging or decaying yeast furnishes a more impure product than a sound and vigorous yeast. The raw material used in the distillery must also be considered. The corn, rye, and potato fusel oil differ in composition, so that through experience one is enabled to detect the materials used, by the odor of the raw spirit. The fusel oil of the rye spirit contains, besides amyl alcohol, aromatic onanthic ether; the molasses spirit contains the ethers of caproic acid, capric

acid, caprylic acid, etc., which are very similar to the so-called oil of wine. Finally, the construction of the distillatory apparatus also influences the quality of the product. High pressure and too long a sojourn of the alcoholic vapors in the rectifier or dephlegmator are also said to be detrimental.

As it is necessary for some industries to use pure alcohol, these impurities are generally removed by either of two processes: (1) Filtration of the raw spirit through charcoal; (2) refining, by fractional distillation, or, in some cases, a combination of both.

In the manufacture of brandies, the former method is generally and successfully used, as a trace of impurity gives the brandy its characteristic aroma and taste. Finely powdered charcoal made from soft wood or bark served as the filtering medium. It is well known that charcoal, by virtue of its absorbing capacity, serves as a decolorizer and deodorant, and in order to effect thorough absorption, the spirit must be diluted to about 40 per cent by volume (80 proof). In smaller plants the filter consists of a vat packed with charcoal. The larger distilleries and refineries use a battery of iron cylinders packed with granular or powdered charcoal. Steam is conducted into the battery until the charcoal is thoroughly saturated; then the spirits flow in, displacing the steam and filling the pores of the charcoal. The larger part of the impurities is absorbed in the lower cylinder, while the remaining impurities are removed during the passage through the remaining cylinders. If a filter is ineffective, it is cut out, the spirit is drawn off, steam is introduced, which forces the distillate into the condenser. This distillate constitutes the so-called "feints." The feints is a dilute spirit, which is milky in appearance on account of the presence of fusel oil. After standing, the fusel separates and can then be utilized, while the alcoholic liquid is worked up anew. The emptied filtering cylinder is repacked with charcoal and used as the last filter. The used charcoal is either ignited in a special furnace, or else purified by means of superheated steam.

Refining of Spirits.—In order to produce an entirely fusel-free and highly concentrated alcohol, which is used for blending wine, cognac, etc., as well as for scientific and certain technical purposes, the filtered alcohol must undergo a fractional distillation. It is essential that the alcohol, whether filtered or not, be diluted to about 40 to 50 per cent by volume (50 to 100 proof).

The rectifier for refining in general is the same as the distilling apparatus, but, inasmuch as the operation is a fractional one, it is an intermittent one. The columns are equipped with caps, bells, or sieves.

Through distillation we receive:

1. The first runnings or fore-shot. This is the first distillate which contains those impurities of the alcohol which vaporize below the boiling point of the latter. Among these impurities acetic aldehyde is especially predominant.

2. Rectified fine spirit, which is divided into several distinct products, of which the first still contains some substances vaporizable at a low temperature, and the intermediate products are pure alcohol, while the last portions already contain substances which volatilize at temperatures above the boiling point of alcohol. All

DISTILLATION

of these products are separately collected at different intervals and furnish:

(a) Wine spirit, commercially known as Cologne spirit. It contains 96 per cent of alcohol by volume (192 proof).

(b) Prime spirit, which is technically absolute alcohol. For medicinal purposes it meets the requirements of the alcohol deodoratum of the United States Pharmacopœia. It contains 94 to 95 per cent alcohol by volume (188 to 190 proof).

(c) Common spirit or high wine, commercially called "rectified spirit." It is used for blending wine and cognac, for medicinal and all other purposes when a pure, fusel-free, less concentrated alcohol than the foregoing is necessary. It contains about 90 per cent by volume (180 proof).

(d) Alcohol of about 88 per cent by volume (176 proof), which can be used for blending brandies as well as for preparing dilute alcohol (97 to 100 proof).

(e) Weaker alcohols, which are usually re-distilled with the raw spirit.

(f) The so-called last runnings or feints, which usually contain amylic alcohol, are used in various industries, as for example, in the textile industries, on account of their solvent power over fats and oils; in the manufacture of ethereal oil and also in the chemical laboratory.

By means of filtration and fractional distillation, about 85 to 90 per cent of the raw spirit are obtained as rectified spirit, therefore it has been the object of many experiments to improve this yield.

The attempt was made to remove the fusel, by using, in place of charcoal, either soap, oil, or fatty substances. It was believed that these substances would retain the fusel. Besides these, chemical agents as soda, lime, sulphuric acid, acetic acid, nitric acid, chloride of lime (bleaching powder), the peroxides of hydrogen, lead, manganese, etc., which were to destroy the fusel, were used. Most of these agents either act only upon certain components of the fusel, while the higher alcohols remain unchanged, or else the ethyl-alcohol was more energetically attacked than the impurities.

According to "Eisenmann's patent," the fusel could be removed by means of ozonated air, but no more practical results were achieved by this process than by that patented by Bang & Rufin. At one time this latter method received much attention, as it was claimed that if the raw spirit was treated with kerosene, it would give off all its impurities to the latter.

The only successful defuselizing process is that of Traube, by which a sufficiently concentrated potash solution is mixed with the spirit in accordance with its strength, and heated to 60 to 70° C. (140 to 148° F.). Two layers are formed, the upper, which is dark-colored and foul-smelling, contains the impurities, and in the lower we find the purified alcohol with the salt solution. After removing the former, the latter is distilled in a rectifier and concentrated; 97 to 98 per cent of the raw spirit are secured by this process.

But after all, filtration through charcoal is the best practical refining process for brandies, while filtration and fractional distillation are best employed for Cologne spirits. In large distilleries the manufacture of Cologne spirit and rectified alcohol directly from the mash

is both practically and technically the most advantageous when manufactured in apparatus based on Ilges' system. American copper-smiths manufacture an excellently constructed apparatus of this type. In ordinary distillation and refining, a deterioration of the material takes place, as the fermentation products of the normal mash are purer than those of the raw spirit. The presence of atmospheric air in the condenser induces the formation of aldehydes, and, in the raw spirit, foul-smelling substances. By means of slow evaporation in the rectifier fusel oil is decomposed, while in the new automatic spirit apparatus, it is obtained as fusel oil. These apparatus are equipped with very effective dephlegmators and rectifiers, so that it is an easy matter to precipitate the fusel from the alcoholic vapors and to receive only the purest alcoholic vapor in the condenser. In order to prevent an accumulation of fusel in the ever-returning phlegma temperature regulators and fusel separators are attached in the latter, so that the phlegma constantly has a uniform temperature and fusel can never be in excess. The advantages of this process are not only the dispensing with rectification and filtration, but also the production of a pure valuable spirit of about 95 per cent alcohol by volume (190 proof), while the valuable and untaxed fusel is obtained as a by-product. In addition, the yield is greater, as the loss caused by rectification is avoided.

Absolute anhydrous pure alcohol cannot be made in this way, nor can it be prepared by repeated distillation, as alcohol is in itself hygroscopic and tenaciously holds on to the last traces (3 to 4 per cent) of water. This last remnant of water can only be removed by very effective dehydrating agents; as for example, freshly burned lime, anhydrous carbonate of potash, anhydrous white copper sulphate, fused calcium chloride, and especially metallic sodium. By distillation over any of these substances the water is absorbed and an absolutely anhydrous pure alcohol is produced. This process is, however, only carried out in chemical laboratories, and as a precautionary measure this alcohol is stored in small bottles with any of the above substances. This precaution is taken in order to prevent the absorption of moisture by the alcohol.

The distillation of alcohol, as in many other distillatory operations, is merely a mechanical process of purification, as no chemical change takes place, because the distillates have the same chemical composition as the original substance. Distillation is only a mechanical separation of the secondary ingredients from the principal one. Some substances, as for instance, glycerine, when distilled in presence of atmospheric air, will decompose. In such cases the distillation is done in a partial vacuum. By means of an air-pump air is withdrawn, until the boiling point is lowered to that degree at which the distillation can take place without decomposition. It is well known that matter will boil at a lower temperature, when the pressure is decreased; and that decomposition is less liable to occur. Again, other substances cannot be distilled in the presence of much oxygen, so that carbonic acid, hydrogen, or other gases are forced into the still. These gases pass over with the vapors of distillation. This process is called the distillation in an atmosphere of an indifferent gas.

DISTILLED LIQUORS

Another important distillation is the so-called dry distillation, in which organic substances are decomposed into solid, fluid, and gaseous products by means of high temperatures and with the exclusion of air. As a rule these products, called empyreumatical, are formed simultaneously, but are separately collected and treated. An example of dry distillation, which is also called destructive distillation, as it is accompanied by chemical changes, is the distillation of coal for the manufacture of illuminating gas, ammonia-water (in the raw condition, tar-water, which contains cyanides and sulphocyanides in connection with ammonia), semi-fluid, viscous, oily, and very valuable products, as, for example, tar-oil, which is extensively used in the manufacture of aniline colors, antiseptics, and medicinal preparations, are obtained as by-products, while coke is the residue of the coal distillation.

Besides these above-mentioned industries, many others are also based on the distillatory process. Among these are the distillation of wood by which acetic acid, wood alcohol, and wood tar are obtained; the distillation of resins through which turpentine, resin-oils, colophony are obtained; the petroleum industry and many others.

A special branch of distillation is that in which a solid is vaporized and by condensation directly passes from the gaseous to the original solid usually in a crystalline form. This process is called sublimation, and is mostly used to purify volatile solids, as for example, sal-ammonia (chloride of ammonia), benzoic acid, camphor, and indigo. The most interesting part in sublimation is that the solid does not pass through a liquid state, but at once to the gaseous form. The reverse process also takes place in like manner, namely, the condensation from the gaseous state back to the solid condition.

ERNST HANTKE,

Industrial Chemical Institute of Milwaukee.

Distilled Liquors, all the liquids obtained by distillation. It is often customary to consider, in contradistinction to the fermented liquors, wine, beer, cider, vinegar, only those distilled alcoholic liquids which contain about 30 to 50 per cent alcohol by volume (60 to 100 proof), and are consumed as alcoholic beverages or distilled liquors (whiskey, brandy, cognac, rum, arrack, gin, etc.). All the other more highly concentrated alcoholic liquids used in technics, medicine, pharmacy, etc., are called alcoholic spirits. In the distilled liquor beverage, alcohol is always the main ingredient, and the varying aroma and taste, due to the origin and the method of procedure, influence its commercial value. On the other hand, spirits are judged according to their concentration, so that secondary ingredients and aromatic substances deteriorate their value. Hence in the manufacture of spirits everything that is not alcohol is eliminated.

In the United States the concentration of alcohol is determined according to proof-degrees. The regulations of the United States Internal Revenue Office say that "proof spirit shall be held to be that alcoholic liquor which contains one half its volume of alcohol of a specific gravity of 0.7939 at 60° F." Therefore each proof-degree is equivalent to 0.5 volume per cent.

If 100 gallons of liquor contain 48 gallons of absolute, pure alcohol, it is 2 x 48 or 96 proof, and a spirit containing 92 gallons of alcohol per 100 gallons, is one with 92 x 2 or 184 proof. The revenue standard is a liquor with 50 volume per cent (100 proof) of alcohol. "Over" and "under" proof are not officially recognized in the United States, although we find these distinctions given in older books.

The raw materials used in the preparation of alcoholic liquors and spirits are:

1. *Alcoholic liquids*, as wine and its waste and by-products (wine-yeast, grape-cakes), the waste and by-products of the brewing industry, in which the spirit is obtained solely by distillation. The product of the wine distillation is used almost exclusively for cognac and brandy, which are especially manufactured in California and Ohio.

2. *Sugary substances*, as the extracts of the sugar-beet, sugarcane, mainly molasses, and also of sweet fruits (cherries, plums, sweet potato, Jerusalem artichoke, melons, etc.). The sugar must be converted into alcohol prior to distillation.

3. *Starchy substances*, among which we can enumerate the various cereals (barley, barley-malt, corn, rye, wheat, oats, rice, buckwheat, etc.), and also potatoes. Corn, barley, barley-malt, rye, oats, and wheat are mostly used in the United States. Before the alcohol can be obtained, the starch must be transformed into fermentable sugar, which in turn is fermented, previous to distillation.

4. *Fibrous substances*, in which the cellulose is converted into fermentable sugar. The further treatment is the same as above (No. 3). Concentrated mineral acids acting under pressure on cellulose, will cause the formation of fermentable sugar, and since such fibrous substances (peat, sawdust, etc.) are inexpensive, many experiments have been made to obtain a practical method for producing alcohol from such materials. Many such methods have been patented. During the International Chemists' Congress at Berlin, 2-8 June 1903, Simonson, from Christiania, Norway, reported on a process of manufacturing spirit from sawdust and also presented a calculation of the prospective profits, which, however, still lacks the confirmation of actual trial. The manufacture of alcohol from fibre stuff is as yet of theoretical interest, and is therefore merely mentioned here. Likewise is the preparation of

5. *Mineral spirit* of theoretical interest, although it can be prepared in the chemical laboratory. If ethylene (C_2H_4) is conducted into sulphuric acid, ethylsulphuric acid ($C_2H_5HSO_4$) is formed, which if diluted with water will split up into sulphuric acid and alcohol. Ethylene is a gas and is an ingredient of illuminating gas made from coal. It is also easily produced from acetylene (C_2H_2) by nascent hydrogen, according to the formula $C_2H_2 + H_2 = C_2H_4$. Acetylene is cheap, and is most readily obtained by the action of water upon calcium carbide (CaC_2). It is extensively manufactured and copiously used, but undoubtedly these experiments will be perfected in the future.

In accordance with the importance of these various kinds of raw material consumed in the large United States distilleries, we will first

DISTILLED LIQUORS

of all discuss the manufactures of liquors and spirits from starchy substances.

These raw materials are treated, as in the brewing industry, with malt (mostly barley malt, sometimes also rye and wheat malt) in such a way that the diastase of the malt converts the starch into dextrin and sugar. But a distiller's malt differs in its properties from a brewer's malt. While the latter must impart its aroma and taste to the beer and only exert its diastatic power in a moderate degree, the former must be characterized by a maximum of diastatic power. Consequently the distiller prefers a malt from a small-kerneled barley, which has been kilned at low temperatures. The diastatic power is weakened by high temperatures. Consequently some distillers, who operate a malting plant in connection with their distillery, use only green malt, or at most, air-dried malt. The German distillers universally use green malt. In contradistinction to the brewer, the distiller prefers a malt made from a barley rich in nitrogenous matter, as this latter furnishes material for the formation of diastase and for the nourishment of the yeast. It is entirely wrong to suppose that a good brewer's malt is also a good malt for distillers. In mashing, the largest possible amount of starch must be converted into fermentable sugar (maltose) in order to obtain as high a yield of alcohol in the distillation as possible. Under the most favorable conditions 96 per cent of the starch in the mash material can be converted into maltose (the remaining 4 per cent are changed into dextrin), while in practice only about 80 to 81 per cent maltose are obtained, and the remainder is dextrin. After the maltose is decomposed into carbonic acid and alcohol, the dextrin is gradually converted by the diastase into maltose and then fermented. This can only be accomplished with vigorous yeast and proper treatment in the fermenting rooms. On account of this "after-effect" the diastase must be carefully guarded, especially by avoiding high mashing-off temperatures, and the formation of lactic acid and particularly butyric acid, produced by certain bacteria at a temperature of 40 to 50° C. (104 to 122° F.).

The mashing process varies according to the kind of product desired, the capacity of equipment (large, or small, or very small, the latter requiring hand power for mashing in place of machinery), the amount and quality of the raw material, and, oftentimes, on the fancy of the customers. Inasmuch as whiskey is the main product of United States distilleries, we will discuss its preparation first of all.

The word "whiskey" is of Celtic origin, for it apparently is an abbreviation of the word "usquebaugh" or "uisgebeatha," which corresponds to the Latin *aqua vitæ* (water of life). According to historical research the word *aqua vitæ* is a corruption, because the original wording for distilled spirit was *aqua de vite* (water from the grape vine). In mediæval times the monks changed this latter form to the one now in general use.

Although the same word is used in America, Ireland, and Scotland, the product is very different. The Irish and Scotch distilleries use almost exclusively kilned malt (only rarely, other cereals), while the American distilleries have an entirely different equipment and also their own characteristic development.

For the manufacture of whiskey, especially corn and rye, sometimes also bran, wheat, and kilned malt (6 to 15 per cent) are used. The best-known brands are:

Bourbon whiskey, in the manufacture of which corn is the main ingredient. According to the quality of the Bourbon, the materials vary as follows:

BRAND	Malt	Rye	Corn
	Per cent	Per cent	Per cent
Ordinary Bourbons.....	10	10	80
Medium Bourbons.....	12	18-22	66-70
Good Bourbons.....	15	35	50

Rye whiskey when manufactured as a first-class article is made from 10 to 15 per cent kilned malt, 70 per cent rye, and the remainder rye-malt. Some distilleries replace a part of the rye by oats or barley.

Half rye whiskey similarly made as the above, except that for one half of the rye, corn is substituted.

Malt whiskey, in which malt predominates.

Wheat whiskey and

Oat whiskey are made in the same way as rye and half rye whiskey, except that wheat or oats is used in place of rye.

We must remark here, that the above appellations are only correct for the distiller, and that in commerce similar names are given to so-called compound whiskeys. Under this term are meant those products which are obtained from pure whiskey, either by dilution with water and rectified spirits, or by a mixture of several kinds, or by still further blending and mixing. In some cases, other liquors, as, for example, cognac, or rum, or even essences, are added to the pure whiskeys. This compounding is done in accordance with the requirements of local trade, or the special tastes and desires of the customers. The character of the natural product is dependent upon the materials and the methods of mashing and distilling. It is interesting to note that the taste of the public varies as the years pass by. In the United States during the fiscal year 1892-3, 40,835,783 gallons of Bourbon whiskey and 16,702,336 gallons of rye whiskey were made, while in the fiscal year just closed, the production of Bourbon whiskey was only 20,336,250 gallons, while that of rye whiskey was 21,587,221 gallons.

According to the mashing method we distinguish a "sweet mash" and a "sour mash" whiskey. The latter is characterized by a delicate, slightly sour taste and a fine ethereal aroma.

Mashing for Whiskey.—The material is ground separately, weighed in hoppers, and placed under a revenue-lock. In the smaller distilleries the corn is cooked with hot water, and kept boiling by means of steam until the starch is gelatinized. In larger distilleries the corn is gelatinized in high pressure cookers, under a pressure of 60 to 80 pounds. In either case the cooked corn is cooled down to about 164 to 166° F. In the high pressure cookers this reduction in the temperature is accomplished by a vacuum pump. In the smaller plants, malt, rye, or other cereals are added to the corn mash cooled to 164 to 166° F., so that the entire mash has a temperature of about 156 to 160° F. In the larger distilleries the specially prepared rye or malt mash is drawn into the

DISTILLED LIQUORS

cooker by means of a vacuum pump. Here it is thoroughly mixed so that the final temperature is about 154 to 156° F. In order to obtain complete saccharification, mashing is done at this temperature for about 20 minutes, then the mash together with the grains are run into a collecting tub, from which it is pumped through a cooling system into the fermenters. The cooling system usually consists of a worm of a half inch copper pipe, which is encased in an iron water pipe. The mash flows through the copper pipe in one direction, while the current of water flows around the pipe in the opposite direction. It is always desirable to cool the mash to 64° F., but on account of the higher temperature of the cooling water, it is usually possible to cool the mash only to 66 to 68° F. At any rate its temperature should never be above 70° F. The concentration of the mash varies proportionately with the amount of material, and is usually about 18 to 25 per cent (seldom more), according to Balling.

While the mash is pumped into the fermenters, as much water or slop of the same temperature as the mash is added to the latter until its concentration is about 11 to 13 per cent, according to Balling.

The above-described method is used for sweet mash whiskey, while for sour mash slop is always used for mashing in place of water. The slop has not only acquired a definite acidity through the fermentation process, and certain peculiar and flavoring substances from the yeast, but also has obtained certain conversion products, formed by heating the grains in the distiller. Hence by the use of this slop, the whiskey receives those characteristics which have made it popular. In smaller distilleries, oak vats, so-called bushel tubs are used, into which boiling slop is poured, and corn in grits-form is doughed in under constant agitation with the hand (hence the name, hand-made sour mash). The malt and rye are added at 165° F. In medium-sized plants a large quantity of corn is doughed in in a similar manner in special mash tuns, and after the mash becomes somewhat thinner, due to the saccharification, it is pumped into hopper-like copper vessels. After the mashing off, the mash remains in the bushel tubs of the smaller distillery or in the vats of the larger plants for 20 to 24 hours for acidification. After this time, the mash is still of a somewhat solid consistency, so that it is separated in drums by means of a disintegrator. After cooling to the pitching temperature (64 to 68° F.), the mash is diluted with slop, to about 17 to 19 per cent, according to Balling. In some distilleries the concentration is lower.

The mashing process is different in very large distilleries, which have commodious mechanical appliances, and are prepared to mash vast amounts of material. It is customary to bring the corn mashed with water, to the boiling point by means of steam, and then to heat the corn to 300 to 310° F. (60 to 80 pounds pressure). The corn is kept at this temperature for 10 minutes in order to gelatinize the starch. The surplus steam is blown off, and the corn mash is cooled to about 164° F. At the same time, malt, rye, oats, or barley is mashed in with water in a special mash tank, which is supplied with a simple agitator and a double copper attenuator coil. After both mashes are united, the temperature is about 140 to 142° F.,

which is the temperature at which the largest possible amount of sugar is formed.

This mashing method is used in the large factories both for the manufacture of whiskeys, high wines, and spirits. The various brands of whiskey are then made by the use of different materials in varying properties. These large distilleries also use slop in place of water when making a sour mash whiskey. In order to obtain a higher degree of acidification, more lactic acid is allowed to form in the malt mash. In comparing the large distilleries with the smaller ones, we find that while the latter can pay more attention to the characteristic properties of the whiskeys, especially sour mash and fancy goods, the former does its practical work more technically and also obtains much higher yields. The manufacture of concentrated alcoholic spirits is only profitable when all the modern mechanical appliances are at hand, so that, owing to the constant decrease in the price of alcoholic spirits, the number of smaller plants is becoming less.

Fermentation of the Mash.—The sugary mash is fermented in the fermenters by means of yeast. In England, common ale yeast is usually added; in France and Belgium either top-fermenting or compressed yeast, which is also used by bakers, is generally added. In the scientifically operated German distilleries, the inventions and discoveries of modern times are successfully used, as for instance, a pure yeast culture of a distiller's yeast is made according to Hansen's method, just as a pure beer yeast is cultivated in many United States breweries according to the same method. (For a description of this process see under BREWING and YEAST and YEAST CULTURE.) In the United States distilleries a yeast obtained by spontaneous fermentation is generally used. Here Delbrueck's teachings in regard to natural pure culture are of importance. Experience teaches that when several yeast species are present, a certain one can be developed under certain conditions of nourishment, because a mash of definite concentration and proportion of fermentable to non-fermentable substances, made from definite materials, consequently containing definite percentages of albuminous and mineral substances, will vigorously develop at a definite temperature and acidity only one species of yeast and will suppress the rest. By maintaining the same conditions on a larger scale, that is, by using a greater amount of mash, the yeast thus developed can be further propagated. But in spite of the utmost care, natural pure culture is oftentimes defective, because the standard requirements are not rigorously observed. It may also happen that among the air yeasts which are developed for spontaneous fermentation, there is no species which will flourish under these requirements. Consequently, it would be advisable also to introduce in this country pure cultures, made from one individual cell, according to Hansen's method. Then the distiller would not be dependent on chance; and, of course, a pure yeast developed according to Hansen's method, would have to be cared for according to the principles of natural pure culture, as, otherwise, an infection with undesirable yeasts, mycoderma or fission fungi would gradually destroy the pure yeast.

In the United States distilleries the yeast is developed as follows:

A clear malt mash is made from ground

DISTILLED LIQUORS

malt and pure water, generally condensed water. The water is boiled with hops, 1 oz. of hops per gallon of water, cooled to 170° F. and added to the ground malt, whereupon saccharification will take place. As soon as the conversion is completed, a clear mash is drawn either by filtration or extraction, which is then concentrated to 18 to 30 per cent according to Balling and cooled to 70° to 72° F. Air is forced into the mash in small copper vessels, so that after 24 to 48 hours the yeasts of the air will cause fermentation. This mash in the copper jugs is the so-called stock-yeast and is cultivated as needed. In case the yeast thus obtained is not satisfactory, the process is repeated. Most distillers constantly have a supply of this jug-yeast on hand and regenerate it by adding a portion of it to the above described, hopped, clear malt mash. This original yeast is poured into sterilized copper jugs and stored in an ice box or other suitably cool place.

This yeast is propagated for use in this way: Rye and malt are saccharified in water of 148 to 150° F. Acidification takes place during 24 hours, during which a temperature of 150° F. is maintained by means of a copper coil attenuator. After this period cold water is run through the attenuator, and the mash, having 18 to 20 per cent (Balling), is cooled to 66° F. and pitched with jug-yeast. After 12 hours this mash has sufficiently fermented, so that it can be used in pitching the large mashes.

The pitching temperature of the principal whiskey or spirit mash is usually 66 to 68° F. and in many cases of defective cooling is somewhat higher. The yeast mash is allowed to run to the main mash. The fermentation usually commences rapidly and shows an increase in temperature. After 24 hours the fermentation is most vigorous. The duration of fermentation is sometimes only 48 hours, for spirits and sweet mash whiskeys it is 72 hours, while for sour mash whiskey it requires 76 hours.

Sometimes abnormal conditions arise, among which is the so-called "foaming fermentation" that is an exceptionally stormy fermentation, in which losses of alcohol occur, due to the flowing over of the mash over the edge or rim of the fermenter. This is a result of various defects, and is either partly due to the materials, or the yeast, or may be occasioned by irregularities in the operation, or even by other causes. It would lead too far to enumerate them here, but much has been written on this subject by experts.

The fermented mash, called the sour mash, is now pumped into the distilling apparatus, where it is distilled as is fully described in the article DISTILLATION. It is customary to distil the whiskeys to 102-105 proof and spirits to 125-190 proof. In small distilleries an ordinary potstill is used for whiskeys and a liquor of about 70 proof is obtained, which is concentrated to 101-102 proof in a doubler. A doubler consists of a copper cylinder having a wide outlet pipe, from which the vapors enter the condenser. In the small distilleries, the heating is accomplished

by direct firing, by which a peculiar, characteristic taste, which is appreciated by the consumers, is engendered. Such whiskey is called "Fire Copper Bourbon Whiskey."

When oats, barley, or wheat are used in the manufacture of certain whiskeys, they are worked up in the same manner as rye in the above-described mash.

Potatoes are not mashed in the United States, although they are commonly used in Germany. They contain only 18 to 20 per cent of starch, while the cereals contain 60 and more per cent of starch. Instead of mashing the ground, rasped or chipped potatoes in open mash-tubs, as was formerly done and is even done to-day in small plants, they are now first steamed under a pressure of 2 to 3 atmospheres, whereby the starch is put in condition to be easily acted upon by the diastase. After the steaming the potato mass is cooled to 55 to 60° C. (131 to 140° F.), which is the best saccharification temperature. Then this mass is mixed with malt, generally green malt, either in the cooker or in the mash-tub, and saccharified. It is customary in Germany to make a thick mash of 22 per cent (Balling), sometimes even of 26 to 28 per cent. The fermentation is accomplished by the addition of a cultivated pure culture yeast. The distilling process is similar to our method. In Germany less brandy but more highly concentrated alcohol for industrial purposes is made.

A special liquor obtained from starchy substances is arrack, which is made in the East Indies, partly from rice and partly from the juice of the cocoa-trees, called toddy, from which "Arrack de Goa" is distilled. The rice is germinated and treated about the same as barley malt. Good arrack is said to be made from 30 to 35 per cent rice, 3 to 5 per cent toddy, 60 to 65 per cent molasses from the sugarcane.

In all those cases, in which a mealy substance is utilized, the thin slop remains after the distillation, which contains all the ingredients of the corn and yeast mash. Besides the skins and husks, we find albumen, unfermented sugar, lactic acid, acetic acid, glycerine, mineral substances, etc. This wet slop was mainly used as feed for cattle, so that formerly every distiller also had a herd of cattle. It is claimed that an animal's health will suffer if slops are copiously fed, so that on this account, and especially in order to dispense with some of the labor caused by the maintenance of the cattle, the slop was dried. By thorough drying, which can be done immediately after the distillation, spoiling is prevented and a constantly durable and valuable article of commerce, which need never be given away below its full value, is obtained. The drying of slop is accomplished in several operations: (1) Settling of the insoluble substances; (2) Pressing out; (3) Drying in cylindrical driers.

There are also some apparatus in which the slop is concentrated by means of steam, pressed and finally dried.

The feeding value of wet and dry slop can readily be seen from these analytical data, ob-

ANALYSIS OF THE SLOP.

Condition	Water	Proteids	Nitrogen-free carbohydrates	Fat	Cellulose	Ash
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Wet	91.2	2.34	3.63	1.22	0.88	0.74
Dry	11.94	23.43	36.35	12.22	8.78	7.28

DISTILLED LIQUORS

tained by the Industrial Chemical Institute of Milwaukee in an analysis of slop in either condition. The mash material was composed of 80 per cent corn, 10 per cent rye, and 10 per cent malt.

Preparation of Alcohol from Koji, according to Takamine's patent.—This process, which is used in Japan in the manufacture of saké, was changed for other cereals by Takamine, a Japanese, and was introduced by him in 1893-4 in the Manhattan Distillery in Peoria, Ill. But this process has not been extensively used, so that now, after 10 years, it is almost forgotten, although it aroused considerable interest at one time. In this process the spores of a certain fungus, as for instance *aspergillus oryzae* are exposed in hothouse-like compartments to uniformly moist air of 77° F. on steamed, coarse wheat bran. The spores rapidly develop to an exuberant white mold whose mycelium forms numerous spore-bearing threads which grow into the nutrient medium. A considerable portion of the nutrient medium is consumed and a decided rise in temperature is noticeable. According to the temperature, the formation of mold is finished in about 36 to 48 hours, whereupon the mass with the fungi is mixed with an equal amount of wheat bran and extracted in water, whereby the Koji-extract is obtained. This is added at 140° F. to corn, cooked in the customary manner, whereupon complete conversion is effected as with diastase. The mash thus obtained, which has a concentration of about 15 per cent according to Balling, is fermented in four days by means of a fungus, called takamato, propagated in a similar manner to the Koji fungus. It is claimed that the yield in this process is 11 to 12 per cent higher than in the process now in vogue, so that it is really surprising that this process is not adopted.

In the Belgian distilleries Effront's system is successfully used to prevent disturbances in the operation of the plant caused by infection. The main principle in this system is that the highly antiseptic hydrofluoric acid or mono- or bifluoride of ammonia is added to the mash, through which the formation of lactic acid becomes unnecessary; the work is also much more accurate. Yet this process has not yet been introduced in the United States.

The Control of the Distillery.—It is self-evident that the control in the distillery is of prime importance in a rationally operated plant, for which reason also, the large distilleries which have well-equipped laboratories, work advantageously, while on the other hand, the small distillers constantly suffer large losses. The control is properly carried out when regular analyses are made of the raw materials of the supplementary articles, namely the yeast, the mash before and after fermentation, the slop, the water and also the air in the mashing and fermentation cellar. (The Kentucky distilleries use a pure, hard water, rich in lime.) It happens in too many cases that the control is not properly carried out, which is, of course, a loss to the distiller, although at present the small distiller is enabled to have the control carried out by a special laboratory (Industrial Chemical Institute of Milwaukee). When the control is properly exercised, the yield will be increased. Inasmuch as theoretically one pound of starch produces 0.5678 lb. of alcohol, then, according to Hantke, the highest possible yield of a distiller's bushel

(which is always figured at 56 lbs. whether the material actually weighs that much or not) with

60 per cent starch in the material will be	5.76 gal.
Proof alcohol.	
61 per cent starch in the material will be	5.86 gal.
Proof alcohol.	
62 per cent starch in the material will be	5.95 gal.
Proof alcohol.	
63 per cent starch in the material will be	6.05 gal.
Proof alcohol.	

But actually the following yields are obtained from one bushel of grain (56 lbs.):

90 per cent corn + 10 per cent malt, about	4.7 gal.
Proof.	seldom 4.9 gal. Proof.
55 per cent corn + 35 per cent rye + 10 per cent malt,	about 4.25 gal. Proof.
65 per cent rye + 15 per cent malt + 20 per cent of	rye malt or oats, or barley—about 4.0 gal.
Proof.	

Among the sugary materials used in distilling, the molasses, both of the beet and cane sugar refinery, is used, and the production of liquor from molasses is continually increasing. Molasses contains about 70 to 80 per cent extract, of which about 50 per cent is sugar. On account of its concentration the molasses must be diluted and because of its alkalinity it must be neutralized. Hydrochloric acid is generally used for the neutralization. Molasses thus prepared is pitched with yeast and fermented just like a sweet mash, but in many cases it is difficult to ferment the molasses, probably because of the presence of butyric and other fatty acids, which are largely present and are known to retard and stop fermentation. Also very abnormal and undesirable fermentation phenomena, as, for instance, saltpetre fermentation, can be traced to the characteristic properties of the molasses. Lately a liquor is obtained from molasses in the United States which acquires a definite aroma and taste, according to character of yeast mash, so that it resembles certain standard brands, such as Bourbon, etc.

In the West Indies, especially in Jamaica, the molasses of the sugarcane, which is merely extracted to obtain the sugar, so that the molasses contains no admixtures as it does in our sugar refineries, is fermented and distilled. This product is called rum, in which the peculiar aroma is due to butyric ether. An inferior grade of rum is made from the sugar scum. Many brands of rum acquire their bouquet through the addition of clover leaves, Botany-bark, etc. Artificial rum, made by mixing spirit with rum essence and adding a little coloring matter, can readily be distinguished from genuine rum.

Sweet fruits, the juice of which is rich in sugar, also serve as raw materials for the spirit industry. The so-called Kirschwasser is obtained from cherries. Besides the juice, the extract also contains components of the cherry stones, which are crushed and added to the liquid.

Sliwowitz is obtained from prunes, and in like manner a liquor is obtained from peaches (peach brandy). In the East Indies a liquor is distilled from the fermented juice of the date palm, while in the West Indies the same is done with the fermented juice of the plantain. Pine-apples, oranges, apricots and other fruits can also be made to furnish a liquor.

An important industry in the United States as well as elsewhere is the production of brandy in its purest form called cognac. It is the direct

DISTILLED WATER—DISTILLING INDUSTRY

product of the wine distillation. Its quality depends entirely upon the quality of the raw materials. The distillates of the wine distillation are characterized by being free from fusel oil. The aroma is due to cœnanth ether, which is also prepared artificially and is used in imitation cognacs. Cognac receives its brown color from being stored in oak casks.

The by-products of the wine distillation are also utilized, but, of course, furnish an inferior article. A fairly pure brandy can be made from the grape cakes, while the wine yeast furnishes a spirit of a very medium quality.

Gin, kummel, peppermint, etc., are common grain spirit distilled and flavored with juniper berries, caraway, peppermint, etc., mostly when the low wines are doubled. Above the pot-still there is a bell-shaped vessel, containing the flavoring material, and the vapors leaving the still pass over this flavoring material before they enter the dephlegmator or doubler.

The innumerable class of various sweet liqueurs, cordials, and ratafias are mostly only mixtures of good, almost fusel-free spirit with syrup and an aromatic substance, which produces the flavor. Most of them are obtained by steeping fruit or aromatic herbs in pure spirit and submitting the liquid to distillation. They are then colored and sweetened with sugar. The best known are absinthe, anisette, curaçoa, benedictine, boonecamp, crème de menthe, anise, and others.

Recipes for their preparation will be found in special works.

ERNST HANTKE,

Industrial Chemical Institute of Milwaukee.

Distilled Water. See DISTILLATION.

Distilling Industry. The extraordinary consumption of alcoholic liquors, and the extensive application of alcohol for all purposes, show it to be one of the most important substances produced by art. There is but one source of alcohol, its production arising from the fermentation of sugar or other saccharine matter obtained from plants containing either free sugar or starch convertible into sugar. In commerce, when made from maize or other grain, it is called grain-alcohol; from reindeer and Iceland moss, moss-alcohol; from potatoes and beets, root-alcohol; and from grapes, wine-alcohol.

The discovery of the art of distillation is attributed to the Arabian alchemists, the first mention of it occurring about the 11th century; but it was undoubtedly known and practised for centuries before by the Chinese. Brandy was named the water of life, and one of the early alchemists, in his enthusiasm over the discovery, declares that "this admirable essence is an emanation from the Divinity; an element newly revealed to man, but hid from antiquity because the human race was then too young to need this beverage, destined to revive the energies of modern decrepitude." Distillation consists in converting a liquid into vapor in a closed vessel by means of heat, and then conveying the vapor into a cool vessel, where it is reconverted into liquid. Strictly speaking, the spirits are not produced by the act of distillation, but are the result of the previous act of fermentation, distillation merely separating the spirits from the mixture in which they already exist.

The first product that reached the dignity of a place in commerce was so-called rectified

whiskey. It was the crude high wine after it had passed through a layer of charcoal, which largely extracted the fusel oil and made a product ready for sale. To this were frequently added flavoring extracts, the compound then being put into heavily charred barrels, and a little sugar coloring added to smooth over its rankness and fieriness. Following this process a redistilling apparatus was invented, by means of which the fusel oil was more thoroughly extracted from the spirits. To make it more palatable a certain proportion of old-fashioned Bourbon from Kentucky, or rye from Pennsylvania or Maryland, was added to give bouquet, flavor, and the appearance of genuine whiskey. This class of goods became known as redistilled whiskeys, and the proportion of these which were sold in commerce as against the genuine whiskeys of Kentucky and Pennsylvania was 15 to 1. In fact, the genuine goods made in Kentucky were used by dealers mainly for flavoring these so-called redistilled whiskeys. It may be well at this point to define Bourbon whiskey. The name now has a very wide significance. Originally it was whiskey distilled from Indian corn or rye in Bourbon County, Kentucky. As its fame spread, countless imitations sprang up, so that to-day Bourbon whiskey may be said to be whiskey distilled from corn to rye after the manner in which it is made in Bourbon County. The yield of Bourbon whiskey was then about three gallons to the bushel. It was heavy in body and flavor, qualities which made it very valuable in compounding; but it took many years of maturing to neutralize the fusel and other essential oils by the action of the atmosphere. The process of improvement was slow, and the trade recognized the fact that whiskeys required at least three years or more to attain full maturity and become ready for consumption. At this stage the science of mashing was greatly improved, increasing the yield and lessening the cost of production. This had the effect of popularizing Kentucky Bourbons among the masses, and instead of being employed so largely for compounding purposes they came into use on a larger scale as a beverage. It also became patent to distillers and dealers that a larger yield did not injure the quality, but, on the contrary, made the whiskey finer, as it contained less oils when made in quantity, and did not require so much time to develop its highest maturity. The pressure of competition has since induced some distillers of standing to sacrifice quality for quantity, and they have resorted to artificial means to produce the appearance of development. The whiskey which has given Kentucky its reputation is that known as sour mash, and there are a few distilling firms who are so jealous of their reputation that they continue to distil only genuine sour mash, yield being a secondary consideration. To attain a fine bouquet, with its accompanying flavor and body, they eschew all artificial means of forcing development, recognizing that the atmosphere is the only chemist that can bring about such results. These firms constitute the bulwark which maintains the reputation of Kentucky whiskeys. The larger number of the distillers look merely to the production of a deteriorated cheap grade, and the demoralization has taken such deep root that it is claimed by some producers that a year is all the time that is necessary to fit whiskeys for consumption. While the production of cheap

DISTILLING INDUSTRY

grades has lowered the standard of Kentuckies, it has diffused the taste for them among the masses, causing the dealers to substitute them for redistilled whiskeys or so-called "domestics," which are but imitations of the genuine article. The present consumption of whiskeys of all grades made in Kentucky is estimated at about 25,000,000 gallons per annum.

The principal States in which ordinary spirits are produced are Illinois, Indiana, and Ohio.

From its greater availability and its cheapness, grain is in general use; while from fruits, which have a perishable nature and are non-available during the greater part of the year, there is distilled only a limited supply of apple, peach, and grape brandy, the State of California producing more than half of the fruit brandy made in this country. Molasses as a distiller's material yields nothing but rum. Of late, however, attempts have been made to produce pure spirits from that source, but, owing to the difficulty of eliminating the odor of rum the experiment is problematical. There is a very small production of rum, which is principally confined to New England; and the cheapness of grain spirits has tended to reduce the rum product to continually smaller dimensions. It is mainly manufactured for export purposes, very little being used in this country, as straight whiskeys have superseded this once popular beverage. It should be stated that common spirits require no aging, being ready for manufacturing purposes or for compounding the day that they come from the still, and they never improve. In most cases, after having been doctored up to produce the appearance of genuineness, they are palmed off as true whiskey and frequently they are audaciously placed on the market masquerading as sour mash.

In a review of American distilleries it is necessary that I should dwell for a moment upon the distilled spirits consumed in the arts, manufactures, and medicine in this country. Of these alcohol and cologne spirit take the lead, although high wines, whiskey, brandy, rum, and gin are also used. Pure alcohol cannot be obtained by ordinary distillation alone. The rectified spirit or alcohol of the pharmacopœias contains 9 per cent by weight of water in the United States, 16 per cent in Great Britain; proof-spirit or diluted alcohol, 54½ per cent by weight of water in the United States, 51 per cent in Great Britain. That alcohol is used in some localities as a beverage is undoubtedly true, and it is said that fully one half of the alcohol that finds its way to the Northwest is so consumed by Poles, Norwegians, Swedes, Finns, Hungarians, and Russians. It has been estimated that about 15 barrels of alcohol are consumed as a beverage daily in New York, but it is impossible to collect data upon which to found a reliable estimate on this point. The foreigners employed in the coal regions of Pennsylvania are drinkers of alcohol, and a considerable quantity is annually disposed of among them. A large percentage of the cost of pharmaceutical preparations arises from the distilled spirits used in their manufacture. Cologne spirit is used for many purposes for which alcohol would be unsuitable, and whiskey, brandy, rum, and gin form the basis of many proprietary medicines and of tinctures and medicinal wines. The amount of distilled spirits consumed in the arts and manufactures has been estimated at 15 per cent of all distilled spirits consumed.

The inherent repugnance to paying the heavy tax on alcoholic liquors imposed by the government has given rise to a large number of illicit distilleries throughout the country. Occasionally one of these secret stills is unearthed in the large cities, which indicates that there are always more or less of them in operation at the centres of population. In the mountain regions of the country, more particularly in the South, a large amount of distilled liquor is drunk that never has been recorded in the internal revenue department, or paid a penny of taxation. This criminal branch of the history of American distilling would make interesting reading on account of its picturesque character, but I can only allude to it here. For reasons that are obvious, no estimate worth having can be formed of the amount of distilled liquor in the United States that evades the government tax, but the figures would doubtless reach considerable magnitude.

The average quantity of grain used in the production of spirits during the last 10 years is about 22,000,000 bushels. Fully half the grain used is corn.

An important collateral industry is the feeding of cattle and hogs on the distillery slops. During the year ending 30 June 1894 this industry showed the following results:

CATTLE FEED FROM DISTILLERIES.		
	Pounds	Number
Number of cattle fed at regular grain distilleries		62,123
Increase in weight of cattle.....	14,449,516	
Average increase in weight.....	232	
Number of hogs fed.....		25,554
Increase in weight of hogs.....	1,901,748	
Average increase in weight.....	74	
Total increase in weight of cattle and hogs	16,351,264	
To this increase, Illinois contributed 8,000,000 pounds, or about one half.		

The entire production of distilled spirits in the United States for the year 1902 was 128,568,201 gallons; of this 26,209,804 gallons were Bourbon; 18,263,709 gallons, gin; 30,228,804 pure neutral spirits; 4,047,602 gallons, fruit brandy; 10,775,117 gallons, alcohol; and the other 3,000,000 gallons about equally divided between rum and gin.

When one compares these figures of more than 128,000,000 gallons, and the enormous revenue accruing to the benefit of the general taxpayers, with the petty production for private use by farmers a century back, the unexampled progress must be apparent without further comment. The spirit interest has interwoven itself with the life of the nation, so that it has become one of the most trustworthy sources of national income.

The necessity of increasing the revenue has fostered legislation favoring a higher tax, which unfortunately tends to bring among the masses inferior goods; for the higher the impost the lower the standard of quality must be in order to make up for the increase in cost. The purpose of every legislator should be to promote the public health and welfare by making it possible for producers to furnish a wholesome beverage, thoroughly matured, at the minimum cost. To tax it to death does not accomplish this object. It naturally forces the production of cheap imitations, which are made out of common spirit, and often sold the same day that they are made. That whiskey requires several years' time for properly maturing is universally acknowledged.

DISTINGUISHED SERVICE ORDER — DISTRIBUTION

Those brands alone should be, in my opinion, allowed to be sold that can show natural aging.

In European countries alcoholic liquors, such as brandy, etc., are allowed to remain in bond until required by the trade for consumption. This plan always insures a large stock of matured goods in bond. There is no reason why our government should force the tax-payment at any given period.

In order to extend the trade into foreign countries, the privilege of bottling whiskeys in bond, and reducing them to such proof as may be required for commercial purposes, should be extended to the distillers of this country, as it is in Canada, where the government, alive to the interests of its manufacturers, affixes a stamp to each bottle, thus certifying to the genuineness of the contents. This would infuse confidence and promote export trade, as well as afford an opportunity for our citizens to secure a genuine and wholesome beverage. The trade in Canadian whiskeys has been steadily on the increase for years, owing to this privilege so wisely conferred by the Canadian government.

The history of the large combination of American distillers of alcoholic liquors is too recent and somewhat too complicated for me to dwell upon at this time. I have endeavored to show the enormous importance of the distilling industry not only to the government, but to the people of the United States, and my conclusions with reference to legislation on the subject of distilled spirits are arrived at with a sincere desire to foster and assist by intelligent means the progress of one of America's greatest industries.

JAS. E. PEPPER,

Jas. E. Pepper & Co., Lexington, Ky.

Distinguished Service Order, an order instituted by Queen Victoria 6 Sept. 1886 for the purpose of rewarding the naval and military officers mentioned in despatches for their distinguished service. Foreign officers who have been associated with British forces in naval and military operations are eligible as honorary members, and the order ranks next to the order of the Indian empire. The original badge was a gold cross, enameled white, edged gold, with the imperial crown on one side and the cipher V.R.I. on the other, each enclosed in a laurel wreath.

Disto'ma, a trematode, or fluke worm, which is a form of parasite frequently present in cattle and occasionally, in the form of the *Distoma hepaticum*, affecting man. At least eight or nine different species of distoma are known. The commonest ones, however, are the liver flukes of sheep and cattle. The *D. hepaticum*, or the large liver fluke, and the *D. lanceolatum* are the commonest forms. In sheep, the worm gives rise to the disease known as "rot," which is frequently fatal. In man, the affection known as distomiasis results when the gall-bladder and liver passages become infected. The liver is usually enlarged, there is very frequently hepatic pain, jaundice, diarrhoea, vomiting, and ascites. Infection takes place largely through eating plants in which the egg or embryo are found. The domestic cat has a distoma, and in India, Japan, China, and Egypt other forms of fluke are known. A *D. hamotobium*, or *Bilharzia*, is a special form that generally attacks the organs of the genito-urinary system and although rare, it is becoming sufficiently common in this

country, as a result of intercourse with the inhabitants of our Oriental possessions, to cause a certain amount of apprehension that its distribution may become more general.

Disto'mea. See LIVER-FLUKE; TREMATODA.

Distress, or **Distrain** (from the Latin *distingo*, to bind fast), is the taking of a personal chattel of a wrong-doer or a tenant, in order to obtain satisfaction for the wrong done, or for rent, taxes, or service due. The thing taken is also called a distress.

Distribution, in political economy, the apportioning of the products of industry among the people concerned. The methods of distribution have varied and do vary in accordance with the state of social development. They depend on legal as well as on economic conditions. They depend mainly on the ideas and institutions which prevail with reference to property in the three requisites of production—namely, land, labor, and capital. In countries where slavery prevailed, the slaveholder, as the owner alike of land, labor, and capital, disposed at his pleasure of the entire product of industry. Under the feudal system, the cultivator who was attached to the soil and had a fixed interest in it, was to render to his superiors dues in labor, in kind, and latterly in money, which were fixed by custom or authority. Where the system prevails of cultivators owning the soil, as in America, and among the peasant proprietors of the European continent, the owner, inasmuch as he unites in his own person land, labor, and capital, disposes of the entire product, except such portion as may be claimed by the money-lender. In cases where the state owns the land, the cultivator pays a rent or tax to the government, and retains the remainder. The *metayer* system still exists in Italy, the owner advancing the land and stock (in whole or in part), and receiving from the cultivator a fixed share of the produce, generally one half.

In Great Britain, and to a large extent in other countries with a highly developed industry, land, labor, and capital are supplied respectively by three different classes of persons, and their share in the produce is determined by free competition. The classical political economy of England may be defined as a description and analysis of such an economic condition of society. It claims to be a science only in so far as the competitive system prevails. The landlord's share in the produce thus determined is called rent; that of the capitalist and employer is designated as interest, profit, earnings of management, etc.; the laborer's share is wages. It should be pointed out that under such a system the central function in distribution, as well as in production, rests with the employer. As he originates and controls the productive process, so in the distributive process he settles with landlord and laborer, and then disposes of the produce. If the employer operates in whole or in part with borrowed capital, interest on that capital must also be deducted from his share of the produce. All these claims satisfied, the amount of his share will depend on his success in disposing of the product.

Whatever the arrangements regarding property and the distribution of the fruits of industry may be, account must be taken of the share claimed by the government in the form of taxes, for the maintenance of the army and navy and

DISTRIBUTION OF ANIMALS

other means of defense, for justice and police, and for education, etc.

It is now admitted that economists have bestowed excessive attention on production, to the neglect of the problem of distribution. But the reproach has a much wider application than to economists merely, for it may generally be said that while modern communities have enormously increased their productive forces, they have not yet solved the problem of distribution. The enormous inequalities of distribution are a danger felt by all thinking men. It is a question which is more and more challenging the attention of statesmen and economists. An economic system can be satisfactory only when a high standard of production finds its complement in a reasonable and equitable distribution, supplying to the mass of the citizens the means for their due physical, intellectual, and moral development. For a special method of seeking to secure the equitable distribution of profits among those who earn them, see CO-OPERATION.

Distribution of Animals. See ZOÖGEOGRAPHY.

Distribution of Animals in North America. Knowledge upon this subject is deemed of such importance to the public that for several years the Department of Agriculture at Washington has been making scientific investigations, and publishing full reports of its observations and experiments.

When the boundaries of the life zones and areas are accurately mapped, the agriculturist, knowing the faunal area, and the beneficial or harmful animals, birds, and insects, can prepare in advance for the protection of crops. If no means have yet been found of exterminating an animal injurious to a certain crop, the first thing will be to ascertain the exact localities in which such animals exist, and those in which they do not. Mr. L. O. Howard, writing of the San José orange scale-insect, says: "It may prove to be a significant fact that, although nursery stock affected by this scale has for six or seven years back been sent to all the fruit-growing regions of the eastern States, according to our present information the scale has established itself only in regions contained within the so-called Austral life zone. Mapping the points of establishment, it is very interesting to see how accurately this distribution has been followed. This fact will relieve New England fruit-growers north of southern Connecticut; those inhabiting the greater portion of Pennsylvania, except in the southeastern one fifth and a western strip; those in New York, except for the strip up the Hudson River, and the loop which comes in from the northwest and includes the counties bordering Lake Ontario on the south, as well as those inhabiting the northern portion of the lower peninsula of Michigan and all of northern Wisconsin, from any fear of this insect. Such a condition of affairs would seem almost too good to be true, but the possibility of its truth is suggested by what we know up to the present time."

Agriculturists living within the area likely to be invaded by certain animals, large or small, can escape by planting crops not affected, while those living outside may largely increase their revenues by giving special attention to the cultivation of the crops that are affected in the adjacent life zone. A knowledge of the natural life areas and of their distinctive species and crops will enable farmers and fruit-growers to select

the products best adapted to their localities, will help them in their battle with harmful species, and will thus put an end to the present indiscriminate experimentation by which hundreds of thousands, if not millions, of dollars are needlessly expended each year.

Previous to the beginning of the scientific work by the Department of Agriculture, the faunal areas east of the Mississippi valley had been recognized and in a general way defined, and attempts had been made to divide the country as a whole into areas of higher grade. Most zoological writers had agreed in apportioning the United States into three primary provinces or regions—an eastern, reaching from the Atlantic to the plains; a central, from the eastern edge of the plains to the Sierra Nevada and Cascade Range; and a western, or Pacific, from the latter to the Pacific Ocean. It soon became apparent, however, that in order to gain a clear conception of the facts and phenomena of distribution a careful study of the subject must be made in the field, where the actual range of mammals, birds, reptiles, and insects could be ascertained and the distinctive areas contrasted. With this object in view, and with the sanction and approval of the Hon. J. M. Rusk, secretary of agriculture, and the Hon. Edwin Willits, assistant secretary, an experimental biological survey was made in the summer of 1889. The area selected was the San Francisco Mountain region in Arizona, which, because of its isolation, altitude, southern position, and proximity to an arid desert, was believed to offer unusual facilities for a successful study of the problems involved. The area of which a careful survey was made comprises about 5,000 square miles, and enough additional territory was examined to make in all nearly 12,000 square miles. One result of this first survey was the complete overthrow of the main faunal areas previously recognized in the United States, and a radical change in the conception of the principles involved. In ascending the mountain a succession of climatic belts were traversed, similar to those encountered in journeying northward from the southern States to the polar sea, and each belt was found to be inhabited by a distinctive set of animals. The more important results of the survey may be briefly summarized as follows: (1) It was demonstrated that mammals, birds, reptiles, and insects are distributed by association of species; (2) that between the desert of the Little Colorado and the summit of San Francisco Mountain there are seven distinct zones or belts of animal life; and (3) on comparing the principal facts of distribution on this mountain with corresponding facts over the country at large, three important truths became apparent: (a) That the several life zones of the mountain could be correlated with corresponding zones long recognized in the eastern United States; (b) that these same zones are really of transcontinental extent, though never before recognized in the West; and (c) that the fauna of North America as a whole is properly divisible into but two primary life regions, a northern, or Boreal, and a southern, or Austral, both stretching across the continent from ocean to ocean.

The results of this experimental biological survey were so important and far-reaching as completely to revolutionize current notions of distribution. It was perceived that the Austral

DISTRIBUTION OF ANIMALS

as well as the Boreal elements in the fauna are distributed in transcontinental belts; hence the arbitrary and irrational division of the United States into Eastern, Central, and Western "provinces" gave way before a rational system, based on a knowledge of the actual facts of distribution, which were found to conform to the general principle of temperature control early recognized by Humboldt and others.

In 1890 a biological reconnaissance was made of south-central Idaho, the area covered comprising about 20,000 square miles. The zones recognized were the same as in the San Francisco Mountain survey, except that the lowermost was absent. In the report on this expedition the courses of the several zones were described and the characteristic species of animals enumerated. In 1891 the most comprehensive and thorough biological survey ever undertaken was made by the division. An area embracing 100,000 square miles, stretching from

teristic of widely remote regions. Thus, in one place on the east side of the Sierra all of the life zones of North America, from the tableland of Mexico to the polar sea, may be crossed in a distance of only 10 miles.

This expedition, which came to be known as the Death Valley expedition, determined the distinctive species of each zone, traced the courses of the several zones from California to the Colorado Plateau, and made large collections of the mammals, birds, reptiles, and insects, which collections are now deposited in the United States National Museum. The zones were segregated into the two great transcontinental regions—Boreal and Austral (see map).

In 1892 the northern boundary of the lower Austral zone was traced from New Mexico eastward across Texas, Indian Territory, and Arkansas to the Mississippi River. In 1893 a study was made, in the interest of biology, of Wyoming, a large part of which State was

Map showing life zones of the United States.

the Pacific coast to the 113th meridian and from lat. 34° to lat. 38°, was chosen as the field of operations. This area comprises the greater part of southern California and Nevada, southwestern Utah, and the northwestern corner of Arizona, thus including all of the torrid desert valleys and ranges between the Sierra Nevada and the Colorado Plateau. It embraces also the highest and lowest lands within the United States—from Death Valley, nearly 500 feet below the level of the sea, to the lofty snow-capped peaks of the high Sierra, culminating in Mount Whitney at an altitude of nearly 15,000 feet. The region was selected because of the exceptional advantages it offered for studying the distribution of animals in relation to the effects of temperature and humidity at different altitudes. The close proximity of desert valleys and lofty mountains brings near together species which in a more level country are charac-

found to be from 1,000 to 3,000 feet lower than represented on current maps, and consequently the climate is warmer than was supposed by those not residents of the State. The Wind River and Big Horn basins and the plains east of the Big Horn Mountains were found to be upper Austral. Work was done also on the Great Plains in Kansas, Nebraska, the Dakotas, Utah, and on the tableland of Mexico. During the year 1894 a study was made of the greater part of Montana, and the work was continued in South Dakota and in the plateau region of Arizona. In Arizona two sections were run from the plateau south to the lower Austral.

In the annual report of the Department of Agriculture for this division for 1893, the seven life zones of North America, including the tropical, were characterized with special reference to eastern North America. Beginning at the north, these zones may be described as follows:

DISTRIBUTION OF PLANTS — DISTRICT

1. The Arctic or Arctic-Alpine zone lies above the limit of tree-growth, and is characterized by such animals as the snow-bunting, snowy owl, white ptarmigan, polar bear, arctic fox, and barren-ground caribou or reindeer.

2. The Hudsonian zone comprises the northern or higher parts of the great transcontinental coniferous forest, and is inhabited by the wolverene, woodland caribou, moose, great northern shrike, pine bullfinch, white-wing cross-bill, white-crowned sparrow, and fox sparrow.

3. The Canadian zone comprises the southern or lower part of the great transcontinental coniferous forest. Among the characteristic mammals and birds are the porcupine, varying hare, red squirrel, white-throated sparrow, and yellow-rumped warbler.

4. The Transition zone is the belt in which Boreal and Austral elements overlap. It covers the greater part of New England, New York, Pennsylvania, Wisconsin, and southern Michigan, and pushes south along the Alleghenies to the extreme northern part of Georgia. Here are the southern mole and cottontail rabbit, the oriole, bluebird, catbird, thrasher, chewink, and wood-thrush, the hermit and Wilson's thrushes, solitary vireo, bobolink, red squirrel, jumping mouse, chipmunk, and star-nosed mole.

5. The Carolinian zone covers the larger part of the Middle States except the mountains; on the Atlantic coast it reaches from near the mouth of Chesapeake Bay to southern Connecticut, and pushes still farther north in the valleys of the Hudson and Connecticut rivers. It is the region in which is found the gray fox, fox squirrel, cardinal bird, Carolina wren, tufted tit, gnat-catcher, and yellow-breasted chat.

6. The Austroriparian zone covers the greater part of the South Atlantic and Gulf States, beginning at the mouth of Chesapeake Bay. Here the mocking-bird, painted bunting, red-cockaded woodpecker, and chuck-will's-widow are characteristic birds, and the cotton-rats, rice-field rats, wood-rats, little spotted skunks, and free-tailed bats are common mammals.

7. The Tropical region within the United States is restricted to southern Florida, extreme southeast Texas (along the lower Rio Grande and Gulf coast), and the valley of the lower Colorado River in Arizona and California. Among the birds may be mentioned the white-crowned pigeon, zenaida dove, quail doves, a Bahaman vireo, a Bahaman honey-creeper, and caracara eagle.

Since the time of Humboldt, at least, the fact has been recognized that animals are not universally distributed over the earth, but disappear along more or less definite lines which prominently indicate changes in temperature uncongenial to certain species; but exactly what temperatures exert the controlling influence, and how they can be measured, have only recently been discovered. Until recently the mistake was made of assembling all the temperature data in accordance with a single hypothetical law. Then a radically different plan was tried: the temperature data were plotted in accordance with two widely different principles—one with reference to the northern, the other to the southern, boundaries of the zones. This departure was suggested by a somewhat tardy recognition of the fundamental facts of the distribution discovered in 1889; namely, that animals are themselves distributed from two directions—

Boreal species from the north, and Austral species from the south. It seemed reasonable to infer, therefore, that northward distribution should be governed by one set of temperatures, and southward distribution by another. When the sums of the positive temperatures for a large number of localities in the United States were plotted on a large-scale map it was found that isotherms could be drawn that correspond almost exactly with the northern boundaries of the several zones. In the case of the southern boundaries a greater difficulty was encountered, for no data had been published bearing on the temperature control of southward distribution. At the same time it seemed evident, from data previously collected by the division, that species are limited in their southward distribution by the mean temperature of a brief period during the hottest part of the summer. For experimental purposes the mean normal temperature of the hottest six consecutive weeks of summer was assumed to be the factor desired, and this temperature was plotted for a large number of localities. Isotherms were then drawn which marked the southern boundaries of the several zones along the Atlantic coast, and it was found that in ranging westward these isotherms conformed throughout to the tortuous boundaries of the Boreal, Transition, and Upper Austral zones, previously mapped from a study of the actual distribution of animals.

The most zealous upholder of the laws of distribution of animals does not claim that the subject has been disposed of in all its details; but it is believed that the general principles controlling the geographical distribution of animals have been discovered, and that they may be expressed as follows:

1. In northward distribution animals are restricted by the sum of the positive temperatures for the entire season of growth and reproduction. 2. In southward distribution they are restricted by the mean temperature of a brief period during the hottest part of the year. It is believed that these two principles cover the fundamental facts of distribution. The modifications of land and water are always to be considered. Consult: Reports of United States Department of Agriculture; especially, 'North American Fauna' (No. 3, 1890); 'Insect Life' (VII. No. 4, 1895); 'North American Fauna' (No. 5, 1891); 'North American Fauna' (No. 7, 1893); also Allen, 'Geological Distribution of the Mammalia' (Bulletin U. S. Geological Survey No. 4, Vol. IV.); Baird, 'Distribution and Migration of North American Birds' (Series 2, Vol. XII. of 'American Journal of Science and Arts'); and Coues, 'Fur-bearing Animals,' etc.

Distribution of Plants. See PLANT GEOGRAPHY.

District, in the United States. The term has been used historically and currently in five legal senses, besides the vague one of "section of country." (1) Organized bodies of territory administered by the Federal government, not populous or compact enough for Territorial institutions, or for other reasons withdrawn from that system. The District of Columbia, first district, then Territory, then district again; Alaska before its Territorial organization; and from 1804 to 1812 that portion of the Louisiana

DISTRICT OF COLUMBIA

Purchase north of the present boundaries of the State of Louisiana, are instances. (2) The counties in South Carolina were called districts till late in their history. (3) A State or portion of a State in its function as the seat of jurisdiction of a United States court. (See DISTRICT COURT.) Judicial districts never cross State lines. (4) Politically, a section of a State or municipality fixed by law for purposes of legislative or congressional representation. Where the former is based on counties, it is always a defined part of a county, never crossing the lines; if on towns, usually the State senate is chosen from districts made up of certain towns or parts of cities, equally, never confounding two. The Congressional districts are marked off by the State legislature after the new apportionment of a census; sometimes in such a way as to give the party then in control of the legislature a greater number of congressmen than its share of the popular vote entitles it to. (See GERRYMANDER.) (5) A taxing district, by decision of the Supreme Court, is any section of a State described in a statute or order as to be assessed, without respect to political divisions. A remarkable instance was the abandonment of its city charter by Memphis, Tenn., when plundered into ruin by a political ring, and constituting itself the Taxing District of Shelby County, to escape suits against the city as a corporation.

District of Columbia, the national capital and its adjoining territory, owned and administered directly by the United States government, to prevent its actions being hampered by conflicts with local jurisdictions. It consists of 60 square miles of land and 10 of water on the eastern side of the Potomac, at the head of deep-water navigation; an enclave in Maryland, with three rectangular sides and the fourth following the lines of the river, besides the islands in the tidal river. Near the southern side of the district, forming the eastern and southern boundary of the city of Washington, is the large tidal estuary of Anacostia River or the eastern branch of the Potomac; the northwest boundary is formed by Rock Creek, separating Washington proper from Georgetown. There are several brooks. The district is flat and marshy for some distance back, then rises into gentle hills and swells; there is pleasing scenery along Rock Creek. The geological formation is Cretaceous, overlaid with drift; in the latter has been found the conglomerate called breccia, from which handsome columns have been carved, used in the capitol. The soil is light, and especially suitable for market-gardening, to which with dairying and the pasturage for the cows it is chiefly devoted, outside the built-up sections. The nature of the capital as a "court city" gives flower-gardening a great importance, and over \$500,000 worth are sold annually. The farms are very small—about 35 acres for white and 18 for colored occupants. But little over a fifth of the surface is in farms, however; the city and its suburban villages, the great National Park, and reserved grounds of various kinds, taking up most of it. The climate is excessively variable, but generally humid and warm. The rainfall averages 50 inches a year.

The District originated in the politics of the Confederation time. Until the adoption of the Constitution, the Continental Congress assembled on 10 occasions at 8 different places in succession, at Philadelphia, Baltimore, Phila-

delphia, Lancaster, Pa., York, Pa., Philadelphia, Princeton, N. J., Annapolis, Md., Trenton, N. J., New York. The first five were during the Revolution. On 21 June 1783 a band of unpaid militia broke up the session in Philadelphia by hooting the members and pointing muskets in at the windows. This emphasized the need of a district guarded by Federal troops, and on 7 October Congress resolved to erect a building near the falls of the Delaware (Trenton). The jealousy of the South, however, demanded one also near the falls of the Potomac, and alternate meetings in the two. Finally a majority abolished the second proposition, and a committee was appointed to lay out a town as first voted. There was no money under the Confederation, however, to build or do anything else, and no action was taken on the committee's report. It had been voted to meet in New York till the Federal town was ready; but this was disliked from fear of the "money power" corrupting or overbearing Congress. Philadelphia was proposed, but objected to by the southerners because the Quakers favored abolition. The first Congress under the Constitution revived the government-district plan, but on the banks of the Susquehanna. Finally Jefferson gave a dinner and arranged a "log-roll": two anti-Federalists from the Potomac region, who had voted against the assumption of the State debts by the national government, changed their votes on condition of the Federalists voting to fix the new capital on the Potomac, after remaining 10 years at Philadelphia. The act was passed as agreed 28 June 1790, for establishing the seat of government "at some place between the mouths of the Eastern Branch and the Connogochegue." The first session of Congress was to be held in the new place the first Monday in November 1800. Maryland in 1788 ceded Washington County, and Virginia in 1789 Alexandria County, forming a district 10 miles square; Washington in person laid it out under the Act of 30 March 1791 (having previously sold all his lands in the vicinity). The territory selected included the site of Powhatan's village, Anacostan or Nacochtank; also the existent village of Georgetown, laid out in 1751 and incorporated in 1789,—both on the Maryland side; and on the Virginia side, Alexandria, formerly Belhaven. The site of the new capital itself had been the plantation of one Pope, classically inclined, who by a curious provision called his hill the Capitol and a brook near by the Tiber. Until 9 September the site was called "The Federal City"; then, by order of three commissioners appointed by President Washington, the district was named "The Territory of Columbia," and the city "The City of Washington." For the latter, see that title; also CAPITOL, where is noted the project, after its burning by the British, of removing the capital north, which was carried by the speaker's casting vote, but buried in committee. In 1846 no Federal buildings having been erected on the Virginia side, nor likely to be, Alexandria County was retroceded to that State. In 1871 the business men of the District, fretting under their political nullity, it was constituted a Territory with a governor and legislature, and delegates in Congress; but was at once seized upon by a ring of speculators who obtained control of its government and plundered it into bankruptcy. In 1874 the territorial government was

DISTRICT OF COLUMBIA — DITTON

abolished and direct government by Congress restored, through three commissioners appointed by the President and confirmed by the senate.

The commission of 1874 was a temporary government; in co-operation with Congress and the citizens of the District, it framed as a permanent system the Act of June 1878, which the Supreme Court has pronounced "the constitution of the District of Columbia." Under this Act half the expenses of the District, previously laid entirely upon the residents, are paid by the national government, as the owner of more than half the real estate. There is no popular suffrage, the entire executive government being in the hands of commissioners appointed by Congress; they recommend legislation and appropriations to the latter, which in turn consults them in the same matters. The government, though not appointed by popular vote, is nevertheless one steadily deferent to and swayed by public opinion; and so excellent that agitations for restoration of suffrage meet no support. The judiciary of the District dates from 1801.

Population. — 1800: Washington, 8,144; Alexandria, 5,949. 1810: Washington, 15,471; Alexandria, 8,552. 1820: Washington, 23,336; Alexandria, 9,703. 1830: Washington, 30,261; Alexandria, 9,573. 1840: Washington, 33,745; Alexandria, 9,967. 1850: Washington, 51,687; 1860 (same), 75,080; 1870 (same), 131,700; 1880 (District of Columbia), 177,624; 1890 (same), 230,392; 1900 (same), 278,718, of whom 218,196 were in Washington proper and 14,549 in Georgetown. Of these, 20,119 only were foreign born; but 87,186 were colored.

District of Columbia, Courts of. See COURT.

District Courts. See COURT.

Ditch, a trench or fosse on the outside of a fortification or earthwork, serving as an obstacle to the assailant and furnishing earth (*déblai*) for the parapet (*remblai*). It is from 90 feet to 150 feet broad, in regular fortifications, and 10 to 12 feet deep below the natural level of the ground. The fosse around a Roman encampment was usually 9 feet broad and 7 feet deep; but if an attack was apprehended it was made 13 feet wide and 12 feet deep. The agger, or parapet, of the encampment was raised from the earth to the fosse, and was crowned with a row of sharp stakes.

Ditchfield, Peter Hampson, English author and clergyman: b. Westhaughton, Lancashire, 20 April 1854. He was educated at Oriel College, Oxford, entered the Anglican priesthood, and has been rector of Barkham, Berkshire, from 1886. He has published: 'An Ecclesiastical History of Reading' (1883); 'The Romance of Mathematics' (1886); 'Our English Villages' (1890); 'Old English Sports and Customs' (1891); 'The National Churches Series — Germany, Spain, Ireland, Netherlands, Italy, France, Scotland, America, England' (1891-7); 'Guide to Berkshire' (1892); 'Sigund,' a cantata (1893); 'Books Fatal to Their Authors' (1895); 'Old English Customs Extant at the Present Time' (1896); 'Bygone Berkshire' (1896); 'The Sorceress of Paris' (1896); 'The Story of Our English Towns' (1897); 'Memorials of Old Buckinghamshire' (1902).

Dithyrambus, or **Dithyramb**, in Greek literature, a form of lyric or poem sung in honor

of the god Bacchus, at his festivals. Since these festivals were celebrated with all the extravagance which would please the god of wine, the dithyrambus employed in his worship naturally breathed the same frenzy. The character of the dithyrambus therefore requires bold images and lofty periods. The more apparent disorder it contains, the more it partakes of the fire of intoxication, the better it sustains the true dithyrambic character. In the wild Phrygian music it was sung in choirs. Arion of Methymne, in the island of Lesbos, was the first to give a regular choral form to it, about 625 B.C. Lasos of Hermione is said to have been the first who introduced dithyrambic contests into the public games. The expression *dithyrambic poem* denotes, also, any lyric poem filled with a wild and impetuous enthusiasm, as is the case with many odes of Pindar.

Ditmarsh, or **Ditmarshes** (Ger. *Dithmarschen*, "the German marshes"), a district of Holstein in Germany, along the German Ocean, between the mouths of the Elbe and the Eider, so little raised above the sea as to require the protection of strong embankments. Area, 500 square miles. Pop. over 80,000.

Dittany (*Dictamnus*), a genus of plants belonging to the rue family (*Rutaceæ*). The members of this genus are beautiful plants, with alternate compound imparipinnate leaves. Their flowers are large, and white or purplish in color. They are arranged in racemes, the peduncles and pedicels of which secrete in numerous more or less prominent glands the essential oil which gives these plants their odor. Their roots were formerly used in medicine; their flowers furnish the perfumer with a fragrant distilled water. The most common species is the *Dictamnus fraxinella*, the leaves of which greatly resemble those of the ash (whence its specific name, from the Latin *fraxinus*, an ash-tree). It is said that in hot weather the odoriferous particles thrown off from this plant form an inflammable atmosphere around it; and if a lighted candle be brought near the plant, especially in a time of drought, there is a burst of flame around the plant. The dittany of the United States (*Cunila origanoides*) belongs to the mint family (*Labiata*), and is the only one of the 15 species of the genus native in America. It is an exceedingly aromatic herb, with purple-pink flowers arrayed in loose clusters. It is found from New York to Florida, and west to western Georgia and Ohio. The dittany of Crete is *Origanum dictamnus*, and the bastard dittany is a species of *Marrubium* (hoarhound), both labiates.

Ditters von Dittersdorf, *dīt'tèrs fōn dīt'tèrs-dōrf*, **Karl**, German musical composer: b. Vienna 2 Nov. 1739; d. 31 Oct. 1799. He is particularly distinguished in comic compositions, and perhaps unrivaled in this branch of music among the German composers. Several of his operas were represented with great applause even in Italy: 'Doktor und Apotheker'; 'Betrug durch Aberglauben'; and 'Die Liebe im Irrenhause,' were among the most successful of these. He also acquired considerable reputation by his oratorio 'Esther,' which secured his elevation to a place among the Austrian nobility.

Ditton, Humphrey, English mathematician: b. Salisbury 29 May 1675; d. 15 Oct. 1715. Through Sir Isaac Newton he received the ap-

2. Falls of the Potomac.

pointment of mathematical master at Christ's Hospital, which appointment he retained till his death. In 1714, in conjunction with Whiston, he published a new method for finding the longitude at sea, as well as on land. He was the author of several mathematical works, the principal of which are the following: 'General Laws and Nature of Motion' (1705); 'Institution of Fluxions' (1706); 'Treatise on Perspective, Demonstrative and Practical' (1712); 'New Law of Fluids' (1714). He also wrote a 'Discourse Concerning the Resurrection of Jesus Christ' (1712), which was afterward translated into several languages.

Diu, dé'oo, an island of India, belonging to the Portuguese, off the south extremity of Gujerat. On a point on the east end of the island is the fortified town of Diu. Pop. 12,636.

Diuretics, drugs used to increase the elimination of urine. Such diuretics may be direct, in that they affect the renal epithelium, or indirect, in that they increase the blood pressure within the kidney and thus increase the urine elimination. This is largely an artificial classification, since it would seem that urine is always a true secretion and not a filtrate, and the renal epithelium must always be involved in the process of manufacture. Still it is a subdivision that has received wide recognition. Diuretics are frequently used in a number of heart, lung, and kidney diseases; because in the normal elimination of urine certain catabolic products are cast off from the body in the urine. If they are retained, however, they give rise to various degrees of intoxication, which may be even fatal. Thus in certain heart diseases, either from insufficient pressure, or from accompanying disease of the blood vessels, the elimination of the ordinary amount of urinary solids may be insufficient and result in poisoning. Hence diuretics, by increasing the elimination of urine, increase the output of these poisonous products. In all patients for whom diuretics are useful, certain concomitant drugs are of benefit. Those namely that empty the bowels freely and those that increase the elimination of perspiration. Of the numerous diuretics the saline salts of potassium, sodium, lithium, calcium, magnesium, the heart tonics, such as digitalis, adonis, caffeine, strophanthus convallaria, theobromine, are most frequently employed. To this list calomel, copaiba, cubebs, juniper, oil of sandal, and other irritating diuretics might be added. Injections of hot water into the rectum cause a pronounced diuresis, and this method is now recognized to be one of the best modes of inducing an increased elimination of urine.

Divan. 1. With the Turks, the highest council of state: the Turkish ministry. Every pasha has also a divan. 2. In the large mansions of the rich in Turkey a divan signifies a large hall for the reception of visitors, which communicates with a number of ante-chambers surrounding it, and which contains sofas placed round the walls, often adorned with costly tapestry and richly embroidered cushions. 3. Divan, with the Arabs, Persians, and Turks, is used to denote a complete collection of lyric poems, which they call ghazals, and through each of which one single rhyme extends: they never exceed the length of 14 strophes. Such a collection is complete if there are as many divisions as there are letters in the alphabet of the

respective languages; and each division contains at least one poem, the rhymes of which terminate with the letter under which the division falls; some letters are excluded, as few or no words end in them. Goethe applied this name to a collection of poems by himself, written in the eastern fashion. 4. The word is also applied to a soft cushioned seat for the accommodation of several persons.

Diver, a name properly restricted in ornithology to birds of the family *Colymbidae* (q.v.), but applied with little discrimination to various other water-birds of similar habits. The compact, depressed body, powerful, posteriorly placed legs with fully webbed feet, the long sinuous neck, and stout acute bill admirably adapt them for aquatic life and the pursuit of fish. They are strong flyers, but on the land are awkward and stand nearly upright. The plumage is peculiarly compact and resistant to water. Three species are well known in the United States. The great northern diver or loon, *Urinator (Colymbus) imber*, is a large bird, sometimes attaining a length of three feet. Above the plumage is a lustrous black with green and purple metallic reflections, and marked with numerous white spots and streaks; below, a nearly pure white. The loon is distributed throughout the entire northern hemisphere on both fresh and salt waters, and during the winter is found in all parts of the United States, in the northernmost of which it breeds, building its nest among the rushes near or in the water, and laying as a rule but two eggs. The loon is best known by the extreme facility with which it dives at the flash of a gun, thus escaping injury while the ball speeds harmlessly overhead, and for its wild resonant cry, about which many traditions and myths have arisen. It can remain several minutes under water, and swim 100 yards before rising to the surface for air.

The red-throated diver (*U. lumme* or *C. septentrionalis*) is eight or nine inches shorter than the loon, of a rusty black, with profuse small white spots above, white below, with a large distinct chestnut-colored patch on the lower part of the throat. It is distributed like the loon, but is rather more northern, and is found in the United States in the winter only. The black-throated diver (*U. arcticus*) is intermediate between the other two species, from which it is distinguished by a blue-black neck-patch. It is a high northern species, and is represented within the limits of the United States chiefly by a western variety which occurs abundantly on the Pacific coast in winter. Consult: Baird, Brown, and Ridgway, 'Water Birds' (1884); Elliot, 'The Wild Fowl of the United States' (1898).

Dives, dí'vêz (Lat. "rich"), the name popularly adopted for the "rich man" in the parable of the rich man and Lazarus, Luke xvi.

Divi-divi, dé'vê-dé'vê, Libi-dibi, or Libi-divi, the astringent bean-pods of *Casalpinia coriaria*, a tree which grows in northern South America, in the Antilles, and in Mexico, and a member of the family which yields sapan, brazil, and other red woods. The pods are about one inch broad and three inches long, but are generally bent or curled up, and tend to scale off on the outside. They have a pale brown color with a tinge of yellow; sometimes they are spotted and black, and then they are not so good. They are very rich in tannin (especially

DIVIDE—DIVINE RIGHT

in the pod), good samples containing as much as 40 to 50 per cent, and form one of the best tanning materials. They are largely used in calico-printing for blacks and dark shades.

Divide, The Great, or The Continental Divide, names given to an elevated ridge of land in the United States where occurs the parting of the waters which flow to the Atlantic and the Pacific oceans. The name, "The Great Divide," is now commonly applied to a broader extent of country than the Continental Divide or watershed proper. It comprises that region in Montana and Wyoming wherein so many of the large rivers of the United States have their source, and which possesses within itself nearly all the characteristics of a continent. The arrangement of the elevated land masses in relation to the valleys and plateaus is continental; the temperature and vegetation vary almost from that of the tropics to the frigid zones; its mineral wealth is enormous; and its wild animals and great varieties of fish make it the paradise of the hunter and the angler. Its waters flow to the Gulf, the Atlantic, and the Pacific oceans, and streams rise on its eastern border-land whose waters flow to the Arctic Ocean. It is the natural geographical centre of North America.

Dividend, in arithmetic, a number to be divided by another; thus, if 20 is to be divided by 4, 20 is the dividend, and 4 the divisor. In commerce the fractional part of the assets of a bankrupt which is paid to the creditor in proportion to the amount of the debt which he has proved against the estate of the debtor; or the sum periodically paid as interest on loans, debentures, etc., or distributed as profit on the capital of a railway or other company. The sum to be divided is broken up into as many portions as there are bondholders or shareholders to claim them, and the fractional part falling to each holder bears the same proportion to the whole dividend as the amount of stock or shares he holds bears to the whole capital.

Dividing Engine, a machine for marking the divisions on the scales of scientific, mathematical, or other instruments. Some of these machines perform work of extraordinary fineness and accuracy. In making astronomical instruments, spectrometres, metre rods, and such exact instruments, the dividing engine is almost indispensable. Joseph von Fraunhofer was the first to make the instrument for ruling gratings, but others soon followed his lead. See FRAUNHOFER, JOSEPH VON; MICHELSON; ROWLAND; RUTHERFORD; and article on SCREW.

Dividing Range, Great, an Australian chain of mountains, forming the watershed between the rivers flowing into the Pacific and those running westward. It stretches from Cape York on the north to Wilson's Promontory on the south.

Divina Commedia, *dē-vē'nā kōm-mā'dē-ā*. See DANTE.

Divination (Lat. *divinatio*), the art or act of foretelling future events, or discovering things secret or obscure, by the aid of superior beings, or by other than human means. The derivation of the word indicates a belief that omens are sent by divine interposition. Natural divination was anciently thought to come by divine afflatus; artificial divination, by signs, omens, etc. At

an early time divination formed a regular science, intimately allied with religion and furnished with rules and regulations. Even though divination did not have its origin in fraud, it became a fruitful source of imposition. Moses prohibited divination expressly (Deut. xviii. 11). Saul expelled "those that had familiar spirits, and the wizards," from his kingdom; yet he was weak enough to consult the famous witch of Endor shortly before the battle in which he fell. The Egyptians and Greeks had their oracles. With the Romans divination and witchcraft were brought into a kind of system, and constituted part of their religion. (See AUGURS and ARUSPICES.) The ancient Germans had consecrated white horses, from whose snorting and neighing they drew favorable or unfavorable signs. They also followed the guidance of prophetesses, whom they called *Abrucæ*. Many Christians, from the period of the 3d century, adopted the *sortes biblicæ* or *sortes sanctorum*—a mode of judging of the future by opening the Scriptures at random, and forming an opinion from the passage on which the eye happened to fall. (See BIBLIOMANCY.) In early times Virgil's *Æneid* was also used for the same purpose (*sortes Virgilianæ*). All the ancient Asiatic tribes had modes of divination; and sorcerers are common among the Indians of America. Many of the old forms of divination continue to be practised in Christian nations at the present day, sometimes from superstition, sometimes for amusement, gypsy fortune-tellers being often resorted to. There are many names for the different modes of prognosticating the future by means of the various appearances which nature and art present, from the revolutions of the stars down to the grounds of a coffee-cup. The following by no means exhaust the list, as the different modes of divination that have been practised are almost endless: *Æromancy*, divination by air; *aleuromancy*, by flour; *arithmomancy*, by numbers; *bibliomancy*, by the Bible; *capnomancy*, by smoke; *catoptrromancy*, by mirrors; *cheiromancy*, by the palm; *cleidomancy*, by keys; *ciromancy*, by wax; *geomancy*, by the earth; *hepatoscopy*, by the liver of animals; *hydromancy*, by water; *lampadomancy*, by lamps; *necromancy*, by corpses; *nephelomancy*, by clouds; *oneiromancy*, by dreams; *pyromancy*, by fire; *rhabdomancy*, by rods. The works on this subject are very numerous, including the mystical productions of the East, the *Cabala* (q.v.), the treatises on astrology, witchcraft, etc., in the Middle Ages, and the studies of more recent writers. See ASTROLOGY; BLACK ART; CUP, DIVINATION BY; CLAIRVOYANCE; ORACLE; PALMISTRY; WITCHCRAFT.

Bibliography.—Bouché Leclercq, 'Histoire de la divination dans l'antiquité'; Cicero, 'De Divinatione'; Ennemoser, 'History of Magic'; Jung-Stilling, 'Theorie der Geisterkunde'; Schneider, 'De Divinationum Origine et Progressu.'

Divine Right, the doctrine that the right of sovereigns to rule is derived immediately from the Deity, whose representatives they are, and that accordingly they are not responsible to their subjects for their method of governing, nor to any other human court of appeal. This was the doctrine to which the Stuarts were so much attached, and which was taught almost universally by the clergy of the Church of England and in the universities after the Restoration.

DIVING—DIVISIBILITY

Even the tyranny of James II. was not enough to induce the English clergy to renounce this favorite doctrine, and after the revolution about 400 of them, including some of the bishops, sacrificed their benefices rather than forsake their principles in the matter. After this time the theory of divine right and passive obedience was little more heard of in England.

Diving, plunging into water and remaining submerged for greater or less periods of time, with or without communication with the atmospheric air. Diving without the aid of some artificial means to supply the diver with air under water is now rarely practised (unless for amusement) except in sponge, coral, and pearl fishing; and sometimes for recovering treasure from wrecked vessels. The best divers are able to remain about one minute and a third under water, and only in extreme and exceptional cases as long as two minutes. Instances are recorded of divers remaining four, five, and even six minutes under water, but these are of questionable authenticity.

To enable divers to remain for a considerable time (sometimes five or six hours) under water a diving dress has been used, which is so contrived that the diver is constantly supplied with air from above. It consists of a waterproof dress, to which is attached a neck-piece or breast-plate fitted with a segmental screw bayonet joint to which the head-piece or helmet, the neck of which has a corresponding screw, can be attached or removed by one eighth of a turn. Air is supplied by means of a flexible tube, which enters the helmet and communicates with an air-pump. To allow of the escape of the used air there is another flexible tube which is led from the back part of the helmet to the surface of the water. There is a signal line attached to the diving dress, by which the diver communicates with the attendants, and he carries another line in his hand to guide him in returning to the rope or ladder by which he descends.

The diving apparatus now in use makes the diver independent of any connection with persons above the water. A strong metallic air reservoir of steel is carried on the diver's back. A respiratory tube issues from the chamber, and is terminated by a mouth-piece which is held between his lips and teeth. This tube is furnished with a valve which permits the expulsion of air, but opposes the entrance of water. When the diver wishes to leave the water he inflates his dress with air from his reservoir and immediately rises to the surface.

Diving-bell, a device by which work may be carried on under water with a full supply of atmospheric air. To illustrate the principle of this machine take a glass tumbler, plunge it into water with the mouth perpendicularly downward; it will be found that very little water will rise into the tumbler, but as air is compressible, it could not entirely exclude the water, which by its pressure condensed the air a little.

The first diving-bell we read of in Europe was tried at Cadiz by two Greeks in the presence of the Emperor Charles V. The first of any note was made by Dr. Halley. The diving-bell is most commonly made in the form of a truncated cone, the smaller end being closed and the larger one open. It is so suspended that it may sink full of air, with its open

base downward. As a diving-bell of the ordinary construction is open to the objection of not being easily moved about, an ingenious kind of diving-bell, called a *nautilus*, has been invented, which is not open to this objection, but which is entirely at the command of the occupants, who can make it sink or swim, and move it about at pleasure, and can use it at the same time to raise great weights and convey them to any desired spot. See **DIVING**; **NAUTILUS**.

Divining Rod, a forked rod or branch, generally but not necessarily of hazel, by means of which, according to a popular belief not yet wholly extinct, the presence of water, minerals, etc., underground, can be detected. When used, the rod, which is carried slowly along in suspension, will, as is affirmed, dip and point toward the ground when brought over the spot where the concealed water or mineral is to be found.

Divisibility, the capability of being separated into parts. A metaphysical problem, long discussed by philosophers on abstract principles, is the divisibility of matter. The microscope reveals only to an infinitely small extent the subdivision of substances and tissues, organic and inorganic. Even in the mechanical productions of art distinctness of subdivision is amazing. A slip of ivory, of an inch in length, has frequently a hundred equal parts marked on it, all being distinctly visible. Nobert, a Pomeranian optical instrument maker, is renowned for producing the finest rulings on glass which have hitherto been executed. These test-plates, as they are called, contain a number of bands, the coarsest of which in his 20-band plate contains 11,259 spaces to the inch, and the finest, 225,187. Yarn has been spun so fine that one pound of it extended 4,770 miles.

The gold-beaters begin with a ribbon an inch broad and 150 inches long, which has been reduced by passing through rollers, to about the 800th part of an inch in thickness. This ribbon is cut into squares, which are disposed between leaves of vellum, and beat by a heavy hammer till they acquire a breadth of more than three inches, and are therefore extended 10 times. These are again quartered, and placed between the folds of gold-beaters' skin, and stretched out, by the operation of a lighter hammer, to the breadth of five inches. There seems almost no limit to the gold-beater's skill in dividing his tissue of gold, for one grain of gold has been beaten out to a surface of 52 square inches, and leaves have been made 367,500 of which would go to the inch. Iron, the least malleable of the above-mentioned metals, has been reduced to wonderfully thin sheets. Fine tissue paper is about the 1,200th part of an inch in thickness, but at the exhibition of 1851, Gillott, the steel penmaker, exhibited rolled sheets of iron the 1,800th part of an inch in thickness. Since then a sheet has been produced with an area of 55 inches, weighing but 20 grains, and having a thickness of 1-4800th part of an inch.

It has been asserted that wires of pure gold can be drawn of only the 4,000th part of an inch in diameter. But Dr. Wollaston, by an ingenious invention, obtained wires of platinum much finer than this, some of them only the 30,000th part of an inch in diameter. Such excessive fineness is hardly surpassed by the filamentous produc-

DIVISION — DIVORCE

tions of nature. Human hair varies in thickness from the 250th to the 600th part of an inch. The fibre of the coarsest wool is about the 500th part of an inch in diameter, and that of the finest only the 1,500th part. The silk line, as spun by the worm, is about the 5,000th part of an inch thick; but a spider's line is perhaps six times finer, or only the 30,000th part of an inch in diameter; insomuch that a single pound of this attenuated substance might be sufficient to encompass our globe. A single grain of sulphate of copper will communicate a fine azure tint to five gallons of water. Odors are capable of a much wider diffusion. A single grain of musk has been known to perfume a large room for the space of 20 years. Some germs are almost inconceivably minute. Thus the germ known as *micrococcus* is a minute spherical body sometimes no greater in diameter than the 32,000th of an inch. The minute organisms to which the name of *bacteria* is specially applied are rod-shaped bodies about 1,000th of an inch in length. Many of the so-called infusorial animalcules are so exceedingly small that myriads of them may exist in a drop of water.

Division, in mathematics, the dividing of a number so as to discover how many times a lesser number is contained in it; one of the four fundamental rules of arithmetic. The number to be divided is the dividend, the number which divides is the divisor, and the result of the division is the quotient. Division is the converse of multiplication.

In military matters the section of an army consisting of two or more brigades, composed of the various arms of the service, and commanded by a general officer. In the navy, a select number of ships in a fleet or squadron of men-of-war. In deliberative legislation the mode of determining a question at the end of a debate. In the House of Representatives at Washington, a division has no traditional formalities, being determined by the rules of the body itself. In the Senate, a division is accomplished by a roll call. In the British House of Commons the speaker puts the question, and declares whether in his opinion the "ayes" or the "noes" have it. Should his opinion not be acquiesced in by the minority, the house is cleared, and the "ayes" directed to go into the right lobby and the "noes" into the left, where they are counted by two tellers appointed for each party. In the House of Lords the two sides in a division are called "contents" and "not-contents."

Division of Labor, in economics, a theory based on the principle that industry can be best carried on when each man has a special work to do. Constant practice in doing the same thing leads to a perfection which could not otherwise be attained. The classical illustration of it in the history of political economy is that of pin-making as given by Adam Smith: "One man draws out the wire, another straightens it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on is a peculiar business; to whiten the pin is another; it is even a trade by itself to put them into a paper; and the important business of making a pin is in this manner divided into above 18 distinct operations, which in some manufactories are all performed by distinct hands." In this way 10 men could make

about 48,000 pins in a day, whereas, if they worked separately and independently, they certainly could not each of them have made 20, perhaps not one pin in a day. Adam Smith offers the following reasons why the division of labor secures greater efficiency: "First, the increase of dexterity in every particular workman; secondly, the saving of the time which is commonly lost in passing from one species of work to another; and lastly, the invention of a great number of machines which facilitate and abridge labor, and enable one man to do the work of many." Economists believe, however, that Smith has laid too great stress on both the second and third of the above reasons.

In biology, a conception borrowed from economics and introduced into biology by Milne-Edwards to describe the difference of function exhibited by the individual members of an animal colony, or by the different organs, tissues, and cells of a single organism. The figure of a hydroid colony, *Hydractinia*, shows how members, primarily and fundamentally the same in structure, become set apart as nutritive, reproductive, sensitive, and protective. The same division of labor or predominance of special functions in different individuals is beautifully illustrated in the *Siphonophora*.

Diviti'acus, chief of the Ædui, often mentioned in the 'Commentaries of Cæsar.' He was a constant adherent of the Romans, and on one occasion made a visit to Rome, where he became the guest of Cicero, who mentions him in his book, 'De Divinatione,' as belonging to the order of the Druids, and professing much knowledge of the mysteries of nature and the art of divination.

Divorce, the disruption, by the act of law, of the conjugal tie made by a competent court on due cause shown. In the United States, jurisdiction in divorce cases is usually conferred on the law courts by the statutes in the different States. The causes of divorce enumerated in these statutes are by no means uniform in relation to the various States, and are more numerous in many of the western States than in the eastern. In most of the States divorce may be granted on any of the following grounds: adultery, conviction of felony, cruel and inhuman treatment, wilful desertion for periods varying from one to three years, habitual drunkenness, impotency, or neglect to support the wife. In New York adultery is the only cause of absolute divorce. In South Carolina the courts have no power to grant divorce, strictly speaking, the legislature being the only authority for that purpose. In both of these States, as in others, the courts may declare an alleged marriage invalid on grounds which rendered the parties or either of them incapable of contracting it, such as idiocy, lunacy, former husband or wife living, etc. Separation from bed and board, commonly called limited divorce, is granted on the ground of cruel and inhuman treatment; or desertion and refusal to support by the husband may be a ground for a decree setting the wife free from the interference and control of her husband, though it may not sunder the marriage tie.

A person applying for a divorce will not be allowed to obtain judgment should it appear that he or she has been guilty of the same offense, or that there is collusion between the persons concerned in order to procure a divorce; for

DIVORCE

the same reason the plaintiff is always required to prove the existence of the grounds of divorce by satisfactory evidence, even though no contest is made on the other side. Parties also who have condoned the offense, that is, who, after it has been discovered, have consented again to live as husband and wife, are not allowed to obtain a divorce, but a second act of the same nature revives the right of action on the original offense.

The want of harmony in the legislation of the different States on this subject has led to very great confusion and conflict in regard to the rights and liabilities growing out of divorce against non-residents of the State where granted, and some uniform system of laws on the subject is greatly needed. As the jurisdiction of Congress over the subject is doubtful, uniformity can apparently be secured only by an amendment to the Constitution of the United States, or by the concurrent action of the various State legislatures.

By a late report made to Congress by Carroll D. Wright, commissioner of labor, on the subject of marriage and divorce, it appears that the whole number of divorces granted in the United States for a period of 20 years, commencing with 1867, was 328,716, of which 36,072 were granted in Illinois, 25,193 in Indiana, 15,355 in New York, 8,542 in Connecticut, 2,642 in New Jersey, and 163 in South Carolina. The ratio of marriages to one divorce for the same period was lowest in Rhode Island, being 11.11 marriages to each divorce. The cause for which the greatest number of divorces were granted was desertion, divorces on this ground numbering 126,557, or over 38 per cent of the whole number of divorces granted.

The differences in the divorce laws in the States account somewhat for the differences in the number of divorces granted in certain States. A large number of the divorces granted in some of the western States, where high divorce rates prevail, have been obtained by persons residents of other States before the statutory limit of time necessary for a residence in a State, which must elapse before beginning proceedings for a divorce. There are more divorces, in proportion to the population, granted in the United States than in Europe. The number of divorce courts in the United States will account in a great measure for this difference; about each county court, except in New Mexico, New Jersey, and South Carolina, or about 2,921 courts, have the power of granting divorces. There is but one divorce court in England, 28 in Germany, and 79 in France. Canada has few applications for divorce. In the 21 years ending with 1888, 94 divorces had been granted in Nova Scotia and New Brunswick together, and 41 in all the rest of the Dominion of Canada.

In England, the divorce court is composed of a judge ordinary, the three chiefs in the courts of common law, and three puisne judges. It is provided that either spouse may obtain a divorce on the ground of adultery, but in case the wife is petitioner the adultery must be accompanied by cruelty or desertion. By another act the power to pronounce a decree of divorce, which was at first reposed in the whole court, is given to the judge ordinary sitting alone; but in this case the decree so pronounced is a decree *nisi* and cannot become final for at least six months. After a decree of divorce the offending person is free to marry again, even with the paramour.

But it is also enacted that no clergyman shall be compelled to solemnize the marriage of any person who has been divorced. He must, however, allow another clergyman, if willing to do so, to perform the marriage. The same general rules as to collusion, condonation, the conduct of the parties, etc., which obtain in the United States are law also in England. In order to guard against fraud by parties conniving to procure a divorce, power is given to the queen's proctor to interpose, in case he has reasonable grounds to suspect collusion or recrimination, in order to oppose a petition for divorce. By these acts parties are also entitled to obtain a judicial separation on the ground of adultery, cruelty, or desertion. Judicial separation is declared to be in place of a separation "*a mensa et thoro*." A married woman, having obtained decree of judicial separation, is declared to be in all respects as a "*femme sole*" in regard to any property that she has or may acquire. Even before obtaining a separation a woman deserted by her husband may obtain from the court a protection for any property that she has or may acquire by her own industry.

In France there has been great opposition to any laxity in the divorce laws, but since the year 1884 French law has recognized three grounds of divorce: (1) adultery; (2) outrage, cruelty, or previous injury; (3) conviction of an infamous crime. These causes of action are equally available to husband or wife; but it is provided that the wife shall not marry again till after the expiration of 10 months from the date of the dissolution of the previous marriage. It is further provided that, in cases where divorce is sought on the ground of outrage, cruelty, or grievous injury, immediate divorce shall not be granted, but the parties may be granted separation for a year, with due provision for the wife's support during that time, at the end of which a final divorce may be granted if they have not been reunited in the meantime. Substantially the same rules as to condonation prevail as in the United States. All the proceedings necessary in such cases are carefully provided for by the code civil, as well as the consequences to the parties personal or proprietary.

In Germany, the question of divorce gave rise to a long contest. The General Prussian Code permitted divorce on the ground of mutual consent and deep-seated aversion, but on account of the newly-awakened religious life in the 19th century there was a strong opposition; this under Friedrich Wilhelm IV. arose to an overwhelming power. Many attempts were made to establish the laws of divorce on other bases, but on account of the personal antagonism of Friedrich Wilhelm IV. they remained without result. The demand for a biblical ground of divorce was fulfilled by the state, because the Bible does not offer a genuinely comprehensive ground of separation. It was considered that the Prussian law of divorce was lax and capricious and there was a unanimous demand for a more strenuous law in the interest of morals. This demand found recognition even in circles which were most opposed to ecclesiastical influence in politics. The opposing elements were reconciled by the personal influence of Wilhelm IV.; nevertheless the attempts of the legislatures to make a new regulation of divorce remained without results. At the present time attempts are being made for bringing about a common divorce law

DIVORCE—DIX

for all of Germany. This proposed law rests theoretically on very strict principles which find justification in the motives. The Austrian code of common law allows to non-Catholic Christians separation from the bonds of matrimony on account of adultery, malicious desertion, five years' imprisonment, or on account of dangerous diseases, and repeated cruelty of treatment and invincible aversion.

Among the Jews: The enactment of the Mosaic law was the following: "When a man hath taken a wife, . . . and it come to pass that she find no favor in his eyes because he hath found some uncleanness in her, then let him write her a bill of divorcement, and give it in her hand and send her out of his house" (Deut. xxiv. 1). Here, it will be perceived, impurity is the only assigned cause for such divorce. The woman sent away might marry another man, but if he, too, divorced her, it was not permitted her first husband to take her again. The word "uncleanness" in the passage now quoted is a free translation: the Hebrew words mean literally "the nakedness of a thing." The exact import of this expression was sharply contested in the immediately pre-Christian times, the school of Hillel giving it a general meaning, and holding that a man might divorce his wife for the most trivial cause; while that of Shammai considered that the doubtful phrase signified adultery, for which therefore alone a man could put away his wife.

The Mohammedan law of divorce, founded on some passages in the Koran, allows of a separation by mutual consent, giving the wife the right of retaining her marriage portion, unless she agrees to relinquish a part of it as the price of the separation. The parties are permitted to separate and re-unite twice, if they can so agree without any particular conditions; but after the third divorce the husband is not permitted to receive his wife again until she shall have previously married another husband. The act of divorce is a judicial proceeding before the *cadi*, who does not decree it until three months after the application.

The Hindu and Chinese laws of divorce show little regard for women, and not only the causes recognized in European and American countries, but others are deemed sufficient for a husband to discard his wife.

The different Grecian states had each their respective laws of divorce. At Sparta they do not seem to have greatly regarded the delicacy of the marriage bed when the interest of the republic was in question; but divorces appear to have been rare, since the *ephori* fined Lysander for repudiating his wife. At Athens either the husband or wife might procure a divorce by exhibiting a bill for this purpose to the archon, and obtaining the verdict or consent of a jury to whom the question was referred. But the party applying must, it seems, have made application personally; and Alcibiades, according to Plutarch, took advantage of his authority as a husband to prevent his wife from making the application personally; for when she was going from her brother's house, where she had taken refuge, to the archon's to sue for a divorce, he forcibly seized upon her, and confined her to his own house.

The early laws of Rome permitted the husband to divorce his wife for poisoning his children, counterfeiting his keys, or adultery. But

other causes were afterward added; for the first divorce recorded was for the sterility of the wife. This was by Sp. Carrilius Ruga, about 230 B.C. Divorces afterward became very frequent, and a law was, on this account, made by Augustus, requiring additional ceremonies in a divorce; among other things, the presence of seven witnesses to the act of dissolution of the marriage. By the Theodosian code the husband could divorce the wife for adultery, or if she was a witch or a murderess, had sold a free-born person into slavery, violated a sepulchre, committed sacrilege, been accessory to theft or robbery, was given to feasting with strangers without the knowledge or against the wishes of the husband, lodged abroad without good reason, or frequented theatres and shows, her husband forbidding, or was aiding and abetting in plots against the state, or dealt falsely, or offered blows. The wife had equivalent rights in this respect, for she could procure a divorce on similar charges against her husband. He could be re-married immediately; she, not within a year.

The facility of divorce continued, without restriction, under the Roman emperors, but as the modern nations of Europe emerged from the ruins of the Roman empire, they adopted the doctrine of the New Testament (Matt. xix. 6), "What God hath joined together, let not man put asunder."

Divorce, under the laws of the Roman Catholic Church is never allowed where the marriage has been duly contracted, ratified, and consummated. But a perfectly valid marriage contracted between baptized persons can be annulled by the Pope, before its consummation, never after consummation. It is held by canonists that a marriage lawfully and validly contracted but not consummated is annulled by either of the parties taking solemn life-time vows of continence and entering a religious order. If of two unbaptized persons, married, one is converted to the faith and receives baptism, he or she may be released from the marriage bond if the other party refuse to live peaceably and without insult to the Christian religion in the marriage state; and then the released party can marry again. Outside of such conditions as have been stated Christians united in marriage cannot in the Roman Catholic Church be freed from the marriage bond, *vinculum matrimonii*, save after the death of one or other of them. See MARRIAGE AND DIVORCE.

Divorce, Court of. See COURT.

Dix, Beulah Marie, American novelist: b. Massachusetts 1876. She has published: 'Hugh Gwyeth' (1899); 'Soldier Rigdale' (1899); 'The Making of Christopher Ferringham' (1901); 'The Beau's Comedy' (with C. A. Harper, 1902); 'A Little Captive Lad' (1902); 'Blount of Breckenhow' (1903).

Dix, Dorothea Lynde, American philanthropist: b. Hampton, Maine, 4 April 1802; d. Trenton, N. J., 19 July 1887. In her youth she supported herself by teaching in Worcester, Mass., but in 1830 fell heir to some property, after which she devoted her life to the relief and betterment of lunatics, paupers, and criminals. She visited the prisons, asylums, and almshouses of nearly every State in the Union, and by her efforts contributed largely to the establishment of lunatic asylums in those States which had none. She also traveled extensively in Eu-

JOHN ADAMS DIX.

rope in the same service and her efforts materially improved the condition of the insane there, likewise. She published several children's books, and in 1845 'Prisons and Prison Discipline.' In 1903 a bill was favorably received in Congress appropriating \$10,000 for a monument to her at her birthplace. The report of the House Committee declares: "Miss Dix occupies a conspicuous place in history as a philanthropist. Certainly no other woman in modern times has done more to earn the gratitude of the people of this country than this self-sacrificing and devoted woman. Her services during the Civil War as chief of the hospital nurses of the United States and her wonderful success in establishing institutions for the insane—over 30 in number—in the South and West and elsewhere in the country, place her among the noblest examples of humanity in all history." Consult Tiffany, 'Life of Dorothea Lynde Dix' (1890).

Dix, Edwin Asa, American author: b. Newark, N. J., 25 June 1860. He was graduated from Princeton University in 1881; studied law at Columbia College Law School; and was admitted to the bar in 1884. He served as literary editor of 'The Churchman' for a time, and is the author of 'A Midsummer Drive Through the Pyrenees'; 'Deacon Bradbury'; a novel; and many short stories, sketches, and travels.

Dix, John Adams, American statesman and soldier: b. Boscawen, N. H., 24 July 1798; d. New York 21 April 1879. In 1812 he was appointed a cadet in the United States army, and in 1813, ensign. He took part in the operations on the Canadian frontier during the War of 1812; afterward studied law and was admitted to the bar in Washington. In 1826 he was sent as a special messenger to the court of Denmark. He resigned from the army in 1828, and began practising law in Cooperstown, N. Y. Later he was secretary of state and adjutant-general of New York, and was prominently associated with the "Albany Regency," the controlling power of the Democratic party. In 1841 he was elected to the State assembly, and in 1845-9 was a United States senator. In 1861 he was appointed secretary of the treasury by President Buchanan. At this time there were two revenue cutters at New Orleans, and he ordered them to New York. The captain of one refused to obey his order, and Dix telegraphed to put him under arrest, adding the statement which has made him famous, "If any one attempts to haul down the American flag, shoot him on the spot." At the outbreak of the Civil War, he was elected president of the Union Defense Committee, and organized 17 regiments. He was commissioned a major-general of volunteers, and through his active measures saved Maryland to the Union cause. He was elected governor of New York in 1872, but was defeated on a renomination in 1874.

Dix, Morgan, American Episcopal clergyman: b. New York 1 Nov. 1827. He is a son of J. A. Dix (q.v.). He was graduated from Columbia College in 1848 and from the General Theological Seminary in 1852. He then took orders in the Episcopal Church and after serving for a few years as assistant in Trinity Church, New York, became in 1862 the rector of Trinity parish. In November 1902 the 40th anniversary of his rectorship was celebrated. To the

rector of the leading Episcopal church in New York there ever presents itself a great opportunity, and of this opportunity Dr. Morgan Dix has made the best use. Under his wise guidance he has seen Trinity grow in size and power, until to-day the power wielded by its rector is second only to that of the bishop. It has been said of him that "he nominates his own assistants independently of the bishop of the diocese" and that "he presides directly over one ninth of the entire diocese and one fifth of the Episcopalians in Manhattan." Prior to 1901 he had been president of the House of Clerical and Lay Deputies in many successive general conventions of the Episcopal Church. He has published: 'Commentary on the Epistle to the Romans' (1864); 'Exposition of the Epistles to the Galatians and Colossians' (1865); 'Lectures on the Pantheistic Idea of an Impersonal Substance Deity' (1865); 'Lectures on the Two Estates' (1872); 'Memoirs of John A. Dix' (1883); 'The Sacramental System' (1893); 'History of the Parish of Trinity Church' (1899-1901).

Dixey, Henry E., American actor: b. Boston, Mass., 6 Jan. 1859. His earliest success was in the comedy of 'Adonis,' in which he assumed the title role, and he has since played many comic parts.

Dixie, Lady Florence Caroline Douglas, English explorer and writer: b. London 24 May 1857. She explored Patagonia 1878-9, was war correspondent for the London *Morning Post* in the Boer war 1880-1, and was instrumental in securing the liberty of Cetawayo, king of Zululand. She has published: 'The Songs of a Child and Other Poems'; 'Across Patagonia'; 'In the Land of Misfortune'; 'A Defence of Zululand and Its King'; 'The Child Hunters of Patagonia'; 'Aniwee or the Warrior Queen'; 'Gloriana'; 'Redeemed in Blood'; 'Little Cherie'; 'Ijain, or the Evolution of a Mind'; 'Isola,' a drama; 'Two Castaways'; etc.

Dixie, a name associated in negro minstrelsy with the Southern States. It is supposed to be derived from the name of one Dixie, a large-holding and kind-hearted slave-owner on Manhattan Island in the latter part of the 18th century. His treatment of his negroes caused them to regard his plantation (or "Dixie's") as little short of an earthly paradise, and when any of the slaves were taken away from home they always pined for "Dixie's," while singing and talking of its joys. When slavery moved southward in search of a more secure and congenial habitat, the same ideal of "Dixie's" was taken along, and the chant which the former slaves of Dixie sang of their old home became so widespread that its origin was lost sight of and it came to be applied to the southern homes of the negroes.

In fact in the South "Dixie" is held to mean the Southern States, the word being regarded as a derivation and corruption of "Mason and Dixon's line," (q.v.) which originally divided the free and slave States, and supposed by the Southerners to have first come into use when Texas joined the Union and the negroes frequently sang of it as "Dixie."

Dixon, Charles, English naturalist: b. London, England, 20 July 1858. His entire life has been devoted to natural history study, bird migration and the geographical distribution of species having been his especial field. His pub-

lished books include 'Rural Bird Life' (1880); 'Evolution without Natural Selection' (1885); 'Our Rarer Birds' (1888); 'Stray Feathers from Many Birds' (1890); 'Annals of Bird Life' (1890); 'Idle Hours with Nature' (1891); 'The Birds of Our Rambles' (1891); 'The Migration of Birds' (1892); 'Jottings About Birds' (1893); 'Game Birds and Wild Fowl of the British Islands' (1893); 'Nests and Eggs of British Birds' (1893); 'Nests and Eggs of Non-indigenous British Birds' (1894); 'The Migration of British Birds' (1895); 'British Sea Birds' (1896); 'Curiosities of Bird Life' (1897); 'Our Favorite Song Birds' (1897); 'Lost and Vanishing Birds' (1898); 'Bird Life in a Southern Country' (1899); 'Among the Birds in Northern Shires' (1900); 'The Story of the Birds' (1900); 'Birds' Nests' (1902); 'A Popular History of Birds' (1902).

Dixon, Frank Haigh, American educator: b. Winona, Minn., 8 Oct. 1869. He was graduated at the University of Michigan 1892, and has been assistant professor of economics in Dartmouth College since 1898, and secretary of the Amos Tuck School of Administration and Finance since 1900. He has published 'State Railroad Control.'

Dixon, James, American lawyer and statesman: b. Enfield, Conn., 5 Aug. 1814; d. Hartford, Conn., 27 March 1873. He was graduated at Williams College, and achieved distinction in the practice of the law, but turning his attention to public affairs, was repeatedly elected to the Connecticut legislature as a Whig, served two terms in the United States House of Representatives, and was a member of the United States Senate from 1857 to 1869.

Dixon, James Main, American educator: b. Paisley, Scotland, 20 April 1856. He was educated at the University of St. Andrews, was professor of English in the Imperial College of Engineering, Japan, 1879-86; professor of English in the Imperial University of Japan 1886-92, and professor of English literature in Washington University 1892-1901. He has published 'A Dictionary of Idiomatic English Phrases' (1891), and is joint author of an 'Illustrated History of Methodism' (1900).

Dixon, Joseph, American inventor: b. 1799; d. 1869. He was at various times shoemaker, printer, wood engraver, and physician, and establishing crucible works in 1827 at Salem, Mass., became very wealthy. In the course of his experiments he devised important improvements in philography, smelting, bank-note printing, etc.

Dixon, Richard Watson, English clergyman and author: b. London 1833; d. 2 Jan. 1900. He was educated at Oxford; was master in the high school at Carlisle in 1863, and canon of Carlisle in 1874. He became vicar of Hayton in 1873 and of Warkworth in 1883. He published: 'Christ's Company and other Poems' (1861); 'Historical Odes and other Poems' (1864); 'Mano, a Poetical History' (1883); 'Odes and Eclogues' (1884); 'Lyrical Poems' (1885); 'The Story of Eudocia and Her Brothers, a Narrative Poem' (1887); 'Songs and Odes' (1896); 'Essay on the Maintenance of the Church of England' (1875); 'Life of James Dixon' (1874); and 'History of the Church of England from the Abolition

of the Roman Jurisdiction' (1880-1900). He was associated with Burne-Jones, Rossetti, and Morris, in founding the 'Oxford and Cambridge Magazine,' the chief organ of the pre-Raphaelite school.

Dixon, Thomas, Jr., American novelist and clergyman: b. Shelby, N. C., 11 Jan. 1864. He was graduated at Wake Forest College, N. C., 1883, and Greensboro, N. C., law school 1886, and admitted to the bar in the last-named year. After serving from 1884-86 as member of the legislature in North Carolina he resigned to enter the Baptist ministry. He was pastor in Raleigh, N. C., 1887; Boston, Mass., 1888-9, and New York 1889-99. Among his works are: 'Living Problems in Religion and Social Science' (1891); 'What is Religion?' (1892); 'Sermons on Ingersoll' (1894); 'The Leopard's Spots' (1902); 'The One Woman' (1903).

Dixon, William Hepworth, English author: b. Manchester 30 June 1821; d. London 27 Dec. 1879. In 1849 he published a memoir of Howard the philanthropist, followed by the 'Life of William Penn' (1851), and by a work on Admiral Blake (1852). In 1853 he became chief editor of the 'Athenæum,' a post which he retained till 1869. During this period he published several very popular works, including the 'Personal History of Lord Bacon,' 'The Holy Land,' and 'New America,' the last being followed by 'Spiritual Wives.' After his retirement from the 'Athenæum,' he wrote some 25 volumes of history, travel, and fiction, among others, 'Free Russia'; 'Her Majesty's Tower'; 'The Switzers'; 'History of Two Queens, Catharine of Aragon and Anne Boleyn'; 'Royal Windsor.'

Dixon, William MacNeill, English scholar: b. India 1866. He was educated at Trinity College, Dublin, and has been professor of English literature and language in the University of Birmingham from 1894. He has published: 'English Poetry from Blake to Browning'; 'A Tennyson Primer'; 'In the Republic of Letters'; 'History of Trinity College, Dublin.'

Dixon, Ill., county-seat of Lee County, situated on the Rock River, about 65 miles above its junction with the Mississippi River, and on the Illinois C., and the Chicago & N. W. railroads. The manufactures of the city are agricultural implements, wagons, shoes, and condensed milk. It is the seat of one of the normal schools of Illinois. Pop. (1900) 7,917.

Dixon Entrance, a strait on the west coast of North America, separating Queen Charlotte Islands from the Prince of Wales Archipelago, and so dividing British territory from a part of Alaska.

Dixwell, John, English regicide: b. 1608; d. 18 March 1689. After the reaction in England which placed Charles II. upon the throne, and caused himself and his associates to be condemned to death, he escaped to America, changed his name, taking that of John Davids, and lived undiscovered among the inhabitants of New Haven, where he was married and left children. In 1664 he visited two of his fellow regicides, Whalley and Goffe, who had found a refuge amid the solitudes of Hadley, Massachusetts. His favorite study in exile was Raleigh's 'History of the World,' and he cherished a constant faith

that the spirit of liberty in England would produce a new revolution.

Dizful, dēz-fool', Persia, capital of the province of Khuzistan, about 190 miles west of Ispahan, on the river Diz. It has over 35 sacred tombs, and nearly as many mosques; but on account of the heat half the town consists of subterranean excavations in the rock. Pop. about 25,000.

Djezzar, jēz'zār ("butcher"), the name given to Achmed Pasha: b. Bosnia about 1735; d. Acre 1804. He was famous for his obstinate defense of Acre against Napoleon I. He rose, through murder and treason, from the condition of a slave to be Pasha of Acre. In the beginning of 1799 the French entered Syria from Egypt, and advanced from victory to victory till they reached Acre, which was laid siege to on 20 March. By advice of Sir Sidney Smith, Djezzar was induced to hold out; and such was the savage doggedness of his defense that Bonaparte was obliged to retire on 21 May.

Djokdjokarta, dyōk-dyō-kār'tā, or **Najoe-dji-jō-karto**, a residency on the island of Java, with a capital of the same name. Its only high mountain, the volcano Merapi, is 3,150 feet high. It has no large river. Its forests abound in djatti (teak) wood. It was once an independent kingdom, but it is now controlled by the Dutch. Pop. 441,800. The town is the seat of the native sultan and of a Dutch resident. Pop. 45,000.

Dnieper, nē'pēr (Russian, DNJEPR, dnyčp'-ēr; ancient BORYSTHENES), a river of Russia which rises in the government of Smolensk, flows south to Kiev, then southeast to Ekaterinoslaff, then south to Androosk, then southwest to the Black Sea. Below Ekaterinoslaff are the famous rapids through which boats must be guided by pilots, and which can be passed only at full tide. The Dnieper begins to be navigable a little above Smolensk. Its total length is 1,230 miles.

Dniester, nēs'tēr (Russian, DNJESTR, dnyčs'tēr; the ancient TYRAS; later DANASTRIS or DANASTUS), a large river of Europe, which has its source in a lake in the Carpathian Mountain, in Austrian Galicia, and flows into the Black Sea, between Ovidiopol and Ackerman. Its length is over 800 miles; and its course is mostly through Russia. Only when the water is very high can ships of small burden ascend as far as Bender.

Doab, doo'āb (Sanskrit, "Two Waters"), a name in Hindu applied indiscriminately to any tract of country between two rivers. The tract between the Ganges and the Jumna is usually called the Doab; other similar tracts have their distinctive name, as the Bari Doab, between the Bias and Ghara and the Ravi; the Rechna Doab, between the Ravi and the Chenab; and other places.

Doak, Samuel, American Presbyterian clergyman: b. Augusta County, Va., 1 Aug. 1749; d. Bethel, N. C., 12 Dec. 1830. He was graduated from Princeton; was for a time tutor in Hampton Sidney College; and was licensed to preach in 1777. He first settled at Holston, and later at Salem, Tenn., where he built a small church, formed the Salem congregation, and established a school, the first organized in the Mississippi valley. It was incorporated in 1785

as Martin Academy, and in 1795 became Washington College; Doak was its president from 1795 to 1818. He then removed to Bethel, where he founded Tusculum Academy.

Doane, George Hobart, American Roman Catholic clergyman: b. Boston, Mass., 5 Sept. 1830. He is a son of G. W. Doane (q.v.). He was graduated at Jefferson Medical College in 1850, became a deacon in the Protestant Episcopal Church, but later entered the Roman Catholic Church and was ordained priest in 1857. In 1873 he was made vicar-general of Newark, N. J., and in 1886 the Pope made him a domestic prelate with the title of Monsignore. He has written: 'First Principles'; 'Exclusion of Protestant Worship from Rome'; etc.

Doane, George Washington, American Episcopal bishop: b. Trenton, N. J., 27 May 1799; d. Burlington, N. J., 27 April 1859. He was educated at Union College, and was one of the first six students at the General Theological Seminary in New York. He was ordained deacon in 1821 and priest two years later, having become in the meantime an assistant in Trinity Parish, New York. Here he remained until 1825, when he was appointed professor of rhetoric and belles-lettres in Washington (now Trinity) College, Hartford. This position he held for three years, going then to Boston as assistant and afterward rector of Trinity Church. In 1832 he was consecrated bishop of New Jersey, and took up his residence in Burlington, N. J., combining the rectorship of St. Mary's Church with the episcopate until his death. Besides a vigorous prosecution of general religious work in his diocese, he devoted himself especially to the promotion of Christian education, in which he was a firm believer. In 1837 he founded St. Mary's Hall, a boarding* and day school for girls, at Burlington, and in 1846 organized Burlington College in the same town. His zeal in this direction, combined with incomplete knowledge of business principles, led to financial embarrassment and ultimately to presentment for trial before his brother bishops; but the charge was unanimously dismissed. In many ways Bishop Doane was far in advance of his time, advocating daily services and the free church system when they were practically unknown in America. He left a large number of published sermons, lectures, and essays, and was also a poet of no mean ability, his best-known poem being that beginning 'What is That, Mother?'

Doane, William Crosswell, American Protestant Episcopal bishop: b. Boston 2 March 1832. He is a son of G. W. Doane (q.v.). He was ordained deacon (1853) and priest (1856) in St. Mary's Church, Burlington, N. J., serving as assistant there until the latter date, when he took charge of St. Barnabas' Church, Burlington. He succeeded his father in the rectorship of St. Mary's (1859-61), and after holding rectorships at Hartford, Conn. (1861-7), and Albany (1867-9), became in the year last named the first bishop of Albany, on the division of the large diocese of New York. In this position he has acquired a reputation as a wise and statesmanlike administrator, and has been a diligent promoter of religious education. St. Agnes' School at Albany was founded by him. He took a prominent part in the second, third,

DOANE — DOBROVSKY

and fourth Lambeth Conferences, and in the discussions on the revision of the American prayer-book, to which his liturgical knowledge made valuable contributions. He is known as a firm believer in the cathedral system, and has spent much labor on its organization at Albany, including the erection of a magnificent cathedral. His most important literary work is his 'Life of Bishop George Washington Doane' (1860). He has published also: 'Mosaics, or the Harmony of the Collects, Epistles, and Gospels'; 'A Catechism of the Christian Year'; 'The Manifestations of the Risen Lord.'

Doane, William Howard, American composer: b. Preston, Conn., 3 Feb. 1831. He was chief editor of the Baptist 'Hymnal' and has composed numerous popular evangelistic hymns and songs. He has also published more than 20 collections of hymns and several cantatas. He early removed to Cincinnati where he has been president and general manager of a firm of manufacturers of wood-working machinery since 1861.

Doane College, in Crete (q.v.), Neb., a co-educational school, began its legal and corporate existence 11 July 1872. The college was the outgrowth of an academy organized in 1871, which virtually became the preparatory department of the college, which was named in honor of Thomas Doane, a generous benefactor. In 1893 the academy resumed its name, a principal was appointed, and special efforts were made to develop academic life. Doane College is the centre of a group of schools all under the auspices of the General Association of the Congregational Churches of Nebraska. The group is composed of four academies; one at Chadron, in Dawes County, in the northwest part of the State; another at Neligh, in Antelope County, in the northeast; one at Franklin, in Franklin County, in the south; the fourth at Weeping Water, in Cass County, in the east; with Doane College, the head, at Crete, in Saline County. The motto of the college is, 'We build on Christ.'

The government of the college is vested in a board of trustees, consisting of 27 members, who are self-perpetuating. Each member serves three years but is eligible for re-election. Each class of graduates from the college names one of its number as a candidate for membership to the board of trustees, and such name is put on the eligible list. Three of the trustees are representatives of the Nebraska Congregational Churches.

The college courses are classical, literary, and scientific; and the degrees granted are A.B., B.S., and B.L. There are departments of music and art. In 1903 there were connected with the school 17 professors, and about 200 students. Connected with the system there were 700 students. The library contained 9,038 bound volumes and 5,673 pamphlets. The college owns 600 acres of land, 90 acres of which are in the campus, and 50 acres have been made into a park. Aid is furnished worthy and needy students. The endowment fund is \$166,000, and the annual expenses are \$18,000. The college is free from debt.

Dobbs Ferry, N. Y., a residential village in Westchester County, on the Hudson River, and on the New York C. & H. R. Railroad, 25 miles north of the city hall, New York. It is an interesting town historically, having been the scene

of many important events in the Revolutionary War. The Yorktown campaign was planned in the Livingston house, and the first salute fired by a British war sloop to the American flag was given opposite this place. Pop. (1900) 2,888.

Dobereiner, Johann Wolfgang, yō hān vōlf'gāng de'be-ri-ner, German chemist: b. Hof, Bavaria, 15 Dec. 1780; d. Jena 24 March 1849. He was professor of pharmacy and chemistry at Jena for 39 years, and discovered the combustibility of platinum, the apparatus for utilizing which is known as Dobereiner's lamp (q.v.). He published 'Zur Pneumatischen Chemie,' and other works. His correspondence with Goethe and Charles Augustus of Weimar appeared in 1856.

Dobereiner's Lamp, a contrivance for producing an instantaneous light, invented by Prof. Dobereiner, of Jena, in 1824. The light is produced by throwing a jet of hydrogen gas upon recently prepared spongy platinum, whereupon the metal instantly becomes red hot, and then sets fire to the gas. The action depends upon the readiness with which spongy platinum absorbs gases, more especially oxygen gas. The hydrogen is brought into such close contact with oxygen (derived from the atmosphere) in the pores of the platinum that chemical union, attended with evolution of light, takes place.

Dobrizhoffer, dō'brīts-hōf-ēr, Martin, a Jesuit missionary to the native tribes of Paraguay and author of a voluminous and celebrated memoir on the Abipones, a Paraguayan tribe: b. Gratz, Syria, 1717; d. Vienna 17 July 1791. At the age of 19 he entered the Jesuit order and in 1749, having been ordained priest, was assigned to the mission of Paraguay, in which he spent 18 years, returning then to Austria where he passed the remainder of his life, devoting his leisure to writing his memoir 'Historia de Abiponibus, etc.,' that is, 'A history of the Abipones, a cavalier and warlike people of Paraguay, enriched with copious observations on the barbarous natives, rivers, beasts, amphibia, insects, principal serpents, fishes, birds, trees, plants, and peculiarities of the said province.' A translation of the work (somewhat abridged) by Sara, S. T. Coleridge's daughter, was published in three large volumes (1822). Southey, in his 'Tale of Paraguay,' in complimenting Miss Coleridge upon the faithfulness of her translation of so voluminous a work, and one so full of difficulties for the translator, alludes to the Empress Maria Theresa's generous protection of the author after he and his order had been expelled by the Spanish government from South America and after the order had itself been suppressed by the Pope:

And if he could in Merlin's glass have seen
By whom his tomes to speak our tongue were taught,
The old man would have felt as pleased, I ween,
As when he won the ear of that Great Empress Queen.

Dobrovsky, dō'brōf-skē, Joseph, Bohemian critic, historian, and philologist: b. Gyermet, Hungary. 17 Aug. 1753; d. Brünn 6 Jan. 1829. He was without a peer in Bohemian learning, ranking among the greatest philologists and critics with his 'History of the Bohemian Language and Literature' (1792); 'Principles of the Old Slavic Dialect' (1822); 'Grammar of the Bohemian Language,' and a wealth of simi-

lar works, all characterized by accuracy and sound judgment, and conferring unparalleled obligations on Bohemian letters.

Dobrudja, dō-brú'ja, or **Dobrudscha**, a territory forming part of the kingdom of Rumania, included between the Danube and the Black Sea. The principal town is Babadagh. Area, 6,102 square miles. Pop. 199,711.

Dobschau, dōb'show (Hungarian **Dob-sina**), Hungary, town about 52 miles northwest of Miskolcz. Its industries comprise bee-culture, flax-growing, and the mining of copper, quicksilver, cobalt, nickel, and iron. It has a noted ice cavern. Pop. (1890) 4,643.

Dobson, Henry Austin, English poet: b. Plymouth 18 Jan. 1840. In 1856 he became a clerk in the Board of Trade, where he is now one of the officials known as principals. His earliest verses first appeared in the magazine called 'St. Paul's,' and were subsequently published in book form under the title 'Vignettes in Rhyme and Vers de Société' (1873). Since then he has published several other volumes of verse, including 'Proverbs in Porcelain' (1877); 'Old World Idylls' (1883); and 'At the Sign of the Lyre' (1885). Among his prose works may be mentioned his *Lives of Fielding* (1883); *Steele* (1886); *Hogarth* (1879); *Goldsmith* (1889); and *Horace Walpole* (1890); critical biography of *William Hogarth* (1891); 'Thomas Bewick and His Pupils' (1884); 'Four Frenchwomen' (1890); three series of 'Eighteenth Century Vignettes' (1892-6); 'A Paladin of Philanthropy' (1899); 'Sidewalk Studies' (1892). His collected poems were published in one volume in 1897. Many of his poems are written in various French forms, such as the *rondeau* and *ballade*, and all are marked by gracefulness, ease, and careful finish.

Dobson, William, English portrait painter: b. London 1610; d. Oxford 28 Oct. 1646. Having acquired considerable skill as a painter, he came under the notice of Van Dyck, who introduced him to Charles I. On the death of his patron he succeeded him as sergeant-painter to the king. Among his portraits are those of himself and his wife, Sir Charles Cotterell, Sir Thomas Browne's family, the first Duke of Newcastle, the Marquis of Montrose, Fairfax, and Old Parr; and in addition there are other pictures by him, the chief being 'The Beheading of St. John.'

Doce, dō'sā, a river of Brazil, rising by several streams on the eastern slopes of the Serra de Mantiqueira in the state of Minas Geraes, and flowing to the Atlantic, which it enters about 30 miles northeast of Santa Cruz. It is about 600 miles long, and is navigable up to 120 miles from its mouth.

Docetæ, dō-sē'tē, sectaries who held the human nature of Christ to be an illusion, phantasmal, and not real. The word is from the Greek verb *δοκέω*, to appear, to seem. The Docetæ were adherents of the Gnostic school and their peculiar dogma was held by a swarm of Oriental sects which preceded and outlived Arianism, both in the East and West. Their denial of the real humanity of Christ was made on the same ground on which Cerinthus (q.v.) denied that the universe is the creation of the principle of all good. That this view prevailed among sects in apostolic times is inferred from

a passage in the first epistle of St. John: "Every spirit which confesseth that Jesus Christ is come in the flesh is of God; and every spirit, which confesseth not Jesus is not of God."

Dock, a name applied to a large section of the genus *Rumex*, belonging to the buckwheat family (*Polygonaceæ*), chiefly those that are not acid. These are large perennial herbaceous plants, with stout roots, alternate, ovate, and often entire leaves, and bearing panicles of small greenish and usually perfect flowers in whorls. Their roots have an acrid taste, are astringent and styptic and are used in medicine. The root of the water-dock (*Rumex aquaticus*) makes a black color in a solution of sulphate of iron. This plant was greatly venerated by the Druids, who attributed to it miraculous qualities. Numerous species of this genus are known, some widely distributed over the northern hemisphere, 22 species being known in eastern and northern America.

Dock Warrant, a species of warehouse receipt given by a dock-owner to the owner of goods specified in dock warrant, and engaging to deliver them to owners or assignees. The Factor's Act in England has placed dock warrants on the same footing as bills of lading, and in many States of the American Union they have been declared negotiable by statute.

Docket, or **Docquet** (from "dock," to cut short, to abridge), in law, a term indifferently used for a summary of a larger writing; a small piece of paper or parchment containing the heads of a writing; an alphabetical list of cases in a court, or a catalogue of the names of the parties who have suits depending in a court.

Docks and Dock Yards, in the United States. Dock yards, dry docks, lift docks and marine railways are found on the Atlantic coast from Maine to Florida; on the Pacific from California to Washington; along the shores of the Great Lakes, and in the Philippines. On the Atlantic seaboard the most easterly harbor is Bath, Me., which has no dry docks, but a ship railway with a cradle 200 feet long. Extensive shipbuilding, however, is carried on in this city. The Bath Iron Works build and repair large hulls, engines and boilers, turn out shafts of any diameter up to 29 feet in length, and can make castings of 12 tons in weight. Besides the building of iron ships, wooden shipbuilding is carried on extensively at Bath, and most of the famed clipper ships that have made a name for American enterprise and commerce, and challenged the world in their fleet transit over the Atlantic, hailed from Bath, and to-day "Bath, Me.," is a very common inscription on the sterns of sailing ships.

Portland, at the head of an inlet, the largest city in Maine, has two wooden dry docks of the Simpson type; one being 415 feet long, with 23 feet of water over the sill, and a smaller one with a length of 200 feet. The Portland Company's Locomotive Works have large and heavy machinery suitable for repairing marine engines and hulls of vessels.

Near Portsmouth, N. H., the only seaport in the State, on Continental or Fernald's Island, is the Kittery Navy Yard. The famous U. S. S. Kearsarge was built at this station. Repairs of almost any extent can be made at this yard, and almost any kind of shipbuilding may be

DOCKS AND DOCK YARDS

done except the very largest. As a part of the plant, the government is now building a large concrete dry dock, about 750 feet in length over all. This dock will have sufficient capacity to take the largest battleships and merchantmen. The government has in addition a floating dock of 5,300 tons capacity.

Proceeding south the next point of interest is Massachusetts Bay and Boston. At Charlestown, a suburb of Boston, is located the Navy Yard, well equipped for making extensive repairs and for building large engines and ships. Besides the old granite dry dock, built in 1827, the government has now under construction a concrete dock about 750 feet in length over all, with 30 feet of water on the sills. At East Boston is located the plant of the Atlantic Works, covering about 12 acres of land. The largest ship that can be built and launched from the ways of this company is one of 3,500 gross tonnage; to build such ships and overhaul and make extensive repairs, the yard is fitted with a modern plant. This company operates three marine railways, the largest having a capacity of 2,000 tons. The Simpson Patent Dry Dock Company own three dry docks, one of which is 465 feet over all, with 19 feet of water on sill. Near Boston is the city of Quincy, where is located the Fore River Engine Company, with a plant for large and extensive shipbuilding. This company can build the largest class of ships, and is equipped to make the heaviest forgings required in marine work, shafts up to 40 inches in diameter can be turned and bored, and, up to 55 feet in length, can be bored without turning end for end. Although construction work is their chief industry, some repair work is done, and the company is now contemplating the construction of a floating dry dock of the largest size.

At Bristol, R. I., are located the famous shipyards of the Herreshoff Manufacturing Company, where most of the yachts were designed and built which have so successfully defended the America's Cup. Besides yachts, small ships are built at this yard.

At New London, Conn., once famous as a port from which whalers and sealing crafts hailed, is the home of the Eastern Shipbuilding Company, which concern recently launched the S. S. Minnesota, and is now building the S. S. Dakota, which will be launched in the fall of 1903, two of the largest steamships ever built. They are destined to be used in the Oriental trade, and are to ply from Seattle, Wash., to Japan and China. This company has no dry dock at the present time, but are contemplating the construction of some docks of very large capacity. The Morgan Iron Works are also located at New London. Their plant is designed for large and extensive repairs, and the construction work done at this plant is principally engines and boilers. A naval station located at New London is of little importance in so far as construction or repairs are concerned.

Between New London and New York there are no harbors or works of importance to shipping interests. At New York one finds an outer and inner harbor.

On the easterly shore of the inner harbor, and on the East River, the government has established the largest navy yard in this country. A thoroughly efficient and modern shipbuilding plant forms part of the equipment, and large

ships can be built. The ill fated U. S. S. Maine was constructed at this yard. Three dry docks are now in commission, and a fourth one about 571 feet long is under consideration. The existing docks are: One granite dock 362.2 feet over all; one originally wood and recently reconstructed of concrete 491 feet over all, and finally a timber dry dock 658.9 feet over all. The largest ship in the navy can be docked here, and thoroughly overhauled and repaired. Besides the Navy Yard plant, New York harbor is well supplied with shipbuilding plants and shipyards. The largest private docks are owned by J. N. Robins Company, one being 510 feet over all, with 22 feet of water on the sill, and one 600 feet over all, with 25 feet of water on the sill. These two are built of wood of the Simpson type. This company owns several floating docks, the largest being 353 feet long with a lifting capacity of 6,000 tons. The J. N. Robins Company are concerned principally in making repairs, and almost any of the Trans-Atlantic ships can be docked at their yard. The Townsend and Downey Shipbuilding Company, located on Shooter's Island, between Staten Island and New Jersey, has facilities for building and repairing steel vessels, and have two marine railways capable of handling vessels of not more than 5,000 tons.

Near the mouth of Newark Bay, in Elizabeth, N. J., the Crescent Shipyard Company has established a plant where tug boats, oil barges, light draught river steamers, yachts, gunboats, torpedo boats, submarine boats, etc., etc., are built. The 345 foot steel car float for the Cape Charles route of the New York, Philadelphia & Norfolk line is the longest vessel constructed at this yard, with a 47 foot beam and a depth of 12½ feet. Another large vessel constructed here is the 3,200 ton U. S. S. Chattanooga. Not owning any docks of their own the Crescent Company make use of those belonging to the New Jersey Dry Dock & Transportation Company, also at Elizabeth.

At other points in New York harbor are located floating docks with a capacity sufficient to enable them to lift almost any of the vessels docking at New York, except the largest Trans-Atlantic liners. The principal ones being the Morse Shipbuilding Company in South Brooklyn, with a lift dock capable of handling vessels of not over 15,000 tons, and the Tietjen & Lang docks at Hoboken, with four lift docks for small repair work; also at Hoboken is located the W. A. Fletcher Iron Works, where are constructed and repaired boats of the class used in inland navigation of this country.

Near Philadelphia is located the League Island Navy Yard. This yard is well equipped to make all kinds of repairs, both large and small. The existing dry dock is 491.7 feet over all and has 25.5 feet of water over the sill. A concrete and granite dry dock is now in course of construction, 739.5 feet over all, with 30 feet of water on the sill. Cramps Shipyard, established in 1830, and the best known private yard in this country, is located in Philadelphia. Here most of the United States battleships were built. A large fleet of both naval and merchant ships were built at this yard. The Simpson dry dock of this company is 462 feet over all. Philadelphia is particularly well adapted to do repair work, and, if not the largest manufacturing city in the United States, the facilities for the con-

DOCKS AND DOCK YARDS

struction and repair of engines, boilers, etc., are unexcelled. Across the Delaware River at Camden, is located the New York Shipbuilding Company, who, with a modern yard, with covered shipways and the most up-to-date appliances, are capable of constructing and repairing vessels of any size. These works are still in their infancy, but they have a large capacity.

At Wilmington, Del., are located the Harlan & Hollingsworth Company, which can construct ships up to 450 feet in length, with proportionate beam, and equip same ready to go into commission. Their Simpson dry dock is 350 feet long, with 13½ feet of water over the sill. The yards are equipped not only to build, but to make extensive repairs.

At Baltimore large and extensive shipyards have been built in the vicinity on the Patapsco River. At this point the Baltimore Shipbuilding & Dry Dock Company have facilities for docking ships 437 feet in length, 45 feet in width and 22 feet in depth, their dock being 504 feet long on top, with 23 feet of water on the sill. The range of the tide is about one foot. The plant of this company is up-to-date, and they can handle both old and new work economically and with despatch. There are two large dry docks, one the property of the Columbia Iron Works & Dry Dock Company, 505 feet over all; the other 600 feet over all, belonging to William Skinner & Sons. There are also several machine shops and shipyards at this point, where large and extensive repairs can be made. The Columbia Iron Works & Dry Dock Company, the Enterprise Marine Engine & Boiler Works, the People's Machine & Boiler Works, and the Maryland Steel Company are all large works for repair and construction.

Newport News, Va., is the home of the Newport News Shipbuilding & Dry Dock Company, which has a large and extensive plant, where the largest ships, both naval and mercantile, can be built, overhauled and repaired. The two Simpson dry docks at this point are 610 feet and 827 feet, respectively, in length on top. Vessels up to 64 feet beam can be docked.

The Norfolk Navy Yard at Gosport, opposite Norfolk, Va., has a granite dock 319 feet 8 inches long, and a timber dock 491 feet over all. The shops at this yard are of sufficient capacity to build as well as to repair government vessels.

At Port Royal, S. C., the Navy Yard at this point has one timber dock 484 feet 6 inches long, of sufficient size to allow 10,200 ton ships of the class of the U. S. S. Indiana to be docked. This yard is only adapted to make repair work. At Pensacola, Fla., the government has a floating dry dock 201 feet 2 inches long. Moderate repairs can be made at this station. The works of Cosgrove & Company, and Cready & McClintock, where large repairs can be made, are also located here.

At New Orleans, La., there are two floating docks of 200 and 300 feet in length which can be used together to give a length on the keel blocks of 487 feet; the Johnson Iron Works, A. A. Mims, and the Whitney Iron Works do the work of repairs in conjunction with the docks. The U. S. Naval Station is situated at Algiers in the vicinity of New Orleans, where government has a steel floating dock 525 feet long. The yard is not well equipped to do any work excepting very small repairs.

The harbor of San Francisco, the largest

city of the Pacific slope, is well supplied with yards and docks for construction and repairs of ships. The California Dry Dock Company has a stone dock cut in the solid rock at Hunters' Point, where the U. S. S. Oregon has been docked. This company, with the Risdon Iron Works, are well fitted to do the heaviest machine work. The dock referred to above is 490 feet long with a depth of 23 feet over the sill. The Union Iron Works in this city have a 446 foot steel hydraulic lift, with a 4,750 ton capacity. They are well adapted to build the largest ships, both naval and merchant. This yard was made famous as the builders of the 9,600 ton U. S. S. Oregon, which made the run around the Horn during the Spanish war, and arrived at the Cuban coast fit and ready to take part in the battle of Santiago. In addition to the hydraulic lift, this company operates 2 large graving docks, one 420 feet long, with 28 feet of water on the sill, the other 700 feet long, with 30 feet of water on the sill, and several smaller ones with a capacity of 1,200 to 1,600 tons.

The Naval Station of California is located at Mare Island. This station possesses two docks, one 510 feet 6 inches long, built of granite, the other 739 feet 6 inches long over all in course of construction of granite and concrete. The yard is equipped for large and extensive repairs with a 100 ton crane.

The only other dry dock of large capacity on the Pacific coast of the United States is the naval dock at Port Orchard, Wash., within the limits of the Puget Sound Naval Station. This dock is built of timber and is 640 feet long, with 30 feet of water on the sill. The largest ship which has been docked here is the U. S. S. Oregon, with a tonnage of 9,600.

A great development has taken place in recent years in the docking and shipbuilding industries along the shores of the Great Lakes. At West Superior, Wis., a large shipping business is done in wheat and ores, large elevators and coal docks handling the freight, which is shipped chiefly by water. The American Ship Barge Company have located their yards and dry docks at this point. These yards are of sufficient capacity to make extensive repairs to ships employed on the Lakes. The two docks of this company are 537 feet and 606 feet long, with 18 and 17 feet, respectively, depth of water over the sill.

At Marquette, Mich., the water front is lined with immense docks designed for handling the vast ore business of this region. It is not supplied with any dry docks, but the Lake Shore Iron Works, located here, build and make extensive repairs to machinery. At Sault Ste. Marie, located near the Ste. Marie Rapids on the Ship Canal, a large dry dock is contemplated. The Soo Ship Canal, built (1853) to avoid shooting the rapids, was reconstructed and enlarged in 1887. The largest lock, completed in 1896, is 800 feet long, and of sufficient depth over the sill to accommodate vessels of 21 foot draught. The pumps are of sufficient capacity to empty the lock in seven minutes.

At Milwaukee, Wis., there are several small timber dry docks 312 and 315 feet in length, with 15½ and 16 feet of water over the sills. Disabled vessels can secure ordinary repairs to machinery at the shops of the Vulcan Iron Works or the Milwaukee Boiler Works. The Vulcan Iron Works can turn out shafting 16

DOCKS AND DOCK YARDS

inches in diameter and 20 feet long, and can finish screws up to 14 feet in diameter. Their limit in castings is 13 tons.

Chicago is well supplied with dry docks and yards and shops where vessels can be repaired and thoroughly overhauled. The Chicago Shipbuilding Company owns the largest dry dock in the city; it is 525 feet over all, having a depth of water of 18 feet over the sill, and of sufficient capacity to dock lake steamers. Their shops and plant are large enough to make extensive repairs to the hulls and engines of vessels, and they further own an extensive shipbuilding plant, enabling them to build as well as overhaul the largest inland water vessels. The Marine Engine Works can make all ordinary repairs to engines, turn out shaftings 30 inches in diameter and 35 feet long, and make castings up to 20 tons in weight. The Samson Steam Forge Company turn out heavy forgings and finish same, and weld tubes up to two inches in diameter by electricity. There are, besides these, numerous boiler and machine shops where vessels may be thoroughly overhauled and repaired.

At Port Huron, Mich., a 412 foot over all timber dry dock, with 18 feet depth over the sill, affords sufficient capacity to receive the large lake steamers. The Dry Dock Iron Works and the Phoenix Iron Works repair machinery, engines and boilers. There is a floating dry dock in the harbor owned by the Wolverine Dry Dock Company, 210 feet long, with a lifting capacity of 1,000 tons.

Detroit has several large timber dry docks owned by the Detroit Dry Dock Company, the largest being 412 feet long over all and having 18 feet of water over the sill. This company owns a shipyard plant where wooden ships are built, and they make extensive repairs to machinery, engines and boilers. Shafting up to 12 inches in diameter can be made by this firm, and engines with L. P. cylinders 62 inches in diameter have been built at their works. The Eagle Iron Works also build machinery.

At Toledo, Ohio, the Craig Shipbuilding Company builds and repairs hulls and small engines, having no facilities for doing work of any great magnitude; they own, however, the largest dry dock in the city, it being 425 feet long over all, with 16 feet of water over the sill. The Eagle Machine & Iron Works and the Toledo Foundry & Iron Works build, overhaul and repair machinery. At Lorain, Ohio, the Cleveland Shipbuilding Company have built a 560 foot over all dry dock, with 17 feet of water over the sill. This dock can accommodate the lake steamers; only small repairs, however, are done.

Cleveland now carries on a large export trade by water as well as by rail, and is one of the most prominent shipbuilding cities on the Lakes. The American Shipbuilding Company has a river frontage of 1,600 feet, all of which is occupied by their yards and is devoted to shipbuilding purposes. The dock frontage of Cleveland, on the Cuyahoga River, is 67,000 feet, of which 6,000 feet is city property, and on the lake front the city owns 9,000 feet out of 12,500 feet of dock frontage. Three wooden dry docks of the following dimensions are available to vessels: one, the largest, being 50 feet wide and 500 feet long, the other two being 50 feet wide each and 450 feet and 350 feet, respectively, in length.

Besides the American Shipbuilding Company, there are a large number of repair and machine shops in active operation. The Cleveland City Forge & Iron Company are capable of building large hulls and engines, and have facilities for repairs of great magnitude. Shafting of any diameter can be made by them 60 feet long and up to 100 tons in weight. This firm built the shaft for the Fall River steamer Puritan, which is 31 inches in diameter, 37 feet long and 42 tons in weight. The Globe Iron Works make extensive repairs to engines, hulls and boilers, and make castings up to 12 tons. They have capacity for turning out shafts 6 inches in diameter and 20 feet long, and turn shafts of any diameter up to 18 feet in length.

The geographical position of Buffalo makes it the emporium of trade of the Great Lakes and its distribution to interstate points and to the Atlantic seaboard. Supplies and raw stuffs brought here by water or train are unloaded and shipped by rail or water, most of the traffic of the Northwest passing through Buffalo. It has a large and well-protected harbor on the Lake, with several miles of water front and ample facilities to handle the immense grain, lumber and coal trade which passes through her port. The harbor is amply fitted out with shipbuilding and repair plants and dry docks, the largest firm being the Buffalo Dry Dock Company. This plant is able to turn out new ships of a capacity of 4,000 to 5,000 tons, as well as to make extensive repairs to vessels. The annual capable output is about four large ships. The four dry docks owned by this company are of the following dimensions:

Dock	1.*	2.	3.	4.
Long on top.....	478' 0"	358' 0"	305' 0"	381' 0"
Long on blocks.....	438' 0"	326' 0"	270' 0"	350' 0"
Wide at entrance.....	60' 0"	65' 0"	56' 0"	65' 6"
Wide on top.....	84' 0"	43' 0"	38' 0"	45' 0"
Water on sill at mean water level.....	16' 0"	14' 0"	11' 0"	12' 6"

*This dock is capable of taking ships 460' 0" long over all.

There are numerous other firms which are engaged in building tugs, scows, dredges, canal boats and small pleasure craft. They, however, do not control any dry docks. The Delaney Forge & Iron Company make heavy forgings, and are capable of forging shafts of any diameter up to 25 tons in weight, 45 feet in length.

At Montreal, the harbor is continually being improved, and only recently new docks and basins have been completed. The Canadian government dock is 300 feet over all; those of Cantin's and Tate's have a length of 400 feet. The docks are located in the Lachine Canal, and to reach Dock No. 1, the government dock, the vessel must pass through two 270 foot locks and sail about one half mile up the canal. A third lock of similar dimensions has to be passed before reaching Cantin's dock. The largest ship docked in dock No. 2 was 258 feet in length and 36 feet beam. Machine shops are connected with these docks, so that repairs can be made while the ship is in dock. The Allan Steamship Company have their plant at this point. Large hulls and engines can be repaired at the Caledonian Iron Works and the Laurie Engine Company's plant; the latter make castings up to 30 tons in weight.

J. A. BENDEL,
Engineer in Chief Department Docks, New York.

DOCKUM — DOCTRINAIRES

Dockum, dök'koom, or **Dokkum**, Holland, town in the province of Friesland, on the Ee River. Pop. 4,158.

Doctor, a term meaning teacher, or instructor, applied by the ancient Romans to those who delivered public lectures upon philosophical subjects. In the Middle Ages, from the 12th century, it came into use as a title of honor borne by men of great learning, as by Thomas Aquinas (Doctor Angelicus), Duns Scotus (Doctor Subtilis), Roger Bacon (Doctor Mirabilis), Bonaventura (Doctor Seraphicus), and other distinguished schoolmen. It was first made an academical title at the University of Bologna, in Italy, which received from the emperor the right of appointing *doctores legum* (doctors of laws). The University of Paris followed in 1145. Soon after the Popes granted the universities the right of appointing *doctores canonum et decretalium* (teachers of the canon law); and when the study of the civil law came to be combined with that of the canon law, the title was changed to *doctor utriusque juris* (that is, teacher of both laws). The faculties of theology and medicine followed that of law in conferring this title. In the universities of Germany the title of Doctor of Philosophy (Ph.D.) is that which regularly corresponds to M.A. in Great Britain and in America, the philosophical faculty corresponding to the faculty of arts. The degree of Bachelor is subordinate to that of Master and Doctor. The degree of Doctor is either conferred publicly, with certain ceremonies, or by diploma. In many cases it is merely an honorary degree, in other cases it is conferred after examination or when the person receiving it has presented a sufficient thesis on a subject connected with the branch of study to which the degree distinctively belongs. In Great Britain and the United States the degrees of D.D. (Doctor of Divinity), LL.D. (Doctor of Laws), and M.D. (Doctor of Medicine) have long been conferred, the first two being generally honorary. At some of the universities the degrees of D.Lit. (Doctor of Literature), and D.Sc. (Doctor of Science) have been instituted in comparatively recent times, at some also that of D.Phil. (Doctor of Philosophy). The degree of Doctor of Music is conferred at the universities of Oxford, Cambridge, Dublin, London, and Edinburgh. The degree may be honorary or conferred after examination.

Doctor Angel'icus, or **Angelic Doctor**, a title bestowed, by common consent of the scholastic divines, and ratified by the moderns, upon Saint Thomas Aquinas (see AQUINAS, THOMAS). Similar titles have been conferred upon other eminent mediæval divines and philosophers; as Saint Bernard of Clairvaux was called Doctor Mellifluus (of honeyed speech); Alexander of Hales, Doctor Irrefragabilis (irrefragable); William Occam, Doctor Singularis (peerless); Duns Scotus, Doctor Subtilis (subtle).

Dr. Jekyll and Mr. Hyde, **The Strange Case of**, a psychologic romance by Robert Louis Stevenson. Dr. Jekyll is a London physician of position and good character, who in youth showed strong capacities for evil, which he succeeded in suppressing for years. By experiment he learns the use of a drug which gives his lower nature intermittent embodiment in the form of a misshapen, repulsive creature of

violent passions, known as Mr. Hyde. The baser nature triumphs gradually. Hyde commits murder and then suicide, and Jekyll disappears forever. This was the first of Stevenson's books to become widely popular. It was published in 1886.

Dr. Syntax, **The Three Tours of**, a series of three books by William Combe, written in verse, and depicting the adventures of a certain Dr. Syntax, clergyman and teacher, who, on his horse Grizzle, sets out "in search of the picturesque." The work is marked by mild satire, and describes many well-sketched types of character and class. It was published in 1809.

Doctor of the Church, a name given to certain eminent churchmen. Benedict XIV. gave as the things required to make a man a Doctor of the Church; first, learning so eminent as to fit him to be a doctor in the Church and a doctor of the Church; second, heroic sanctity; third, the title must be conferred by a declaration of the Pope or of a general council. The third has not always been insisted upon. In canon law four Doctors of the Church are named: Jerome, Gregory, Ambrose, Augustine. Others are called doctors without the formal declaration of Pope or council: Chrysostom, Gregory Nazianzen, Anselm, Isidore, Peter Chrysologus, Hilary, Athanasius, and Basil have not the full office proper to doctors. Others who have been added by declaration of popes are: St. Thomas of Aquin, St. Bonaventura, St. Leo, St. Bernard, St. Alphonsus Liguori, and St. Francis de Sales.

Doctor-fish. See SURGEON-FISH.

Doctor's Commons, in England, the popular name for the courts and offices formerly occupied by the body incorporated in 1768 under the title of "The College of Doctors of Law exercent in the Ecclesiastical and Admiralty Courts." The buildings were situated on the east side of St. Paul's churchyard. The college consisted of a president (the dean of the arches for the time being), and of those doctors of law who, having regularly taken that degree in either of the universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the rescript of the archbishop of Canterbury, had been elected Fellows of the college in the manner prescribed by the charter. The term commons refers to the meals, taken together in a common dining-room. Since the passing of laws in 1857 which made many legal reforms possible the charter of this college of doctors has been surrendered, the property sold, and the corporation dissolved.

Doctrinaires, dök-tre-närz', a term applied to theorists, or theoretical politicians. The name had its origin in France in 1815. After the second restoration of the Bourbons a small number of deputies would neither rank themselves among the friends of absolute power nor among the defenders of the revolution. They supported Decazes while he was minister; and several of them held offices in the ministry, as, for instance, the counselors of state, Camille Jordan and Royer-Collard. Their system embraced a constitutional monarchy, allowing the government more power than the ultra-liberals would admit; and, on the other hand, restricting the royal power more, and admitting less ap-

proach toward the old form of government than the ultra-royalists demanded. They retired with Decazes, and afterward joined the liberal opposition. The first orator among them was Royer-Collard, and their most distinguished writer out of the chamber, Guizot. They received the name of *doctrinaires* because they were looked upon more as theoretical than practical politicians.

Dod, Daniel, American mechanic: b. Virginia 28 Sept. 1788; d. New York 9 May 1823. He was educated at Rutgers College. He devoted himself to the study of steam machinery and the construction of steam-engines; the Savannah, the first steamship to cross the Atlantic, had an engine of his construction. He was killed by the explosion of a boiler on a steamboat, the machinery of which he had altered.

Dodd, Anna Bowman Blake, American author: b. Brooklyn, N. Y. She was married to Edward Williams Dodd in 1883. She has been a voluminous writer for the magazines from her youth. Her published books are: 'Cathedral Days'; 'The Republic of the Future'; 'In and Out of Normandy Inns'; 'Glorinda'; 'Falaise'; 'On the Norfolk Broads'; 'The Struthers'; and 'An American Husband in Paris.'

Dodd, Frank Howard, American publisher: b. Bloomfield, N. J., 12 April 1844. He prepared at Bloomfield Academy to enter Yale, but instead went into business in the employ of his father, M. W. Dodd, succeeding to the business with Edward S. Dodd, as the firm of Dodd & Mead, in 1870. He is now the head of the firm of Dodd, Mead & Co.

Dodd, Moses Woodruff, American publisher: b. Bloomfield, N. J., 11 Nov. 1813; d. New York 8 April 1899. He graduated from Princeton in 1837 and entered the theological seminary, but abandoned his theological course on account of failing health. In 1839 he became a partner with John S. Taylor in the publishing business; Taylor retired the next year, and the surviving partner carried on the business for 30 years, under the firm name of M. W. Dodd.

Dodd, William, English clergyman and forger: b. Bourne, Lincolnshire, 29 May 1729; d. London 27 July 1777. He was graduated at Cambridge in 1749 and became chaplain to King George III. in 1763. In 1777 he was arrested on the charge of forging Lord Chesterfield's name, and was hanged in Newgate.

Dod'der, a family of plants, probably degenerate *Convolvulaceae*, and known as *Cuscuta*. The characteristics of the family are filiform twining stems, parasitic on other plants, to which they attach themselves by suckers. They have lost all trace of leaves, even the cotyledons of the embryo being no longer distinguishable, while chlorophyll is almost completely absent. In one American species a slight trace of coloring matter has been noticed. The seed germinates very late in spring, and as the seedling rises from the ground a yellow or pink stem soon begins to show the sweeping movements of circumnutation of a climbing plant. If no plant known as the "host" is in the neighborhood for it to take up its quarters on, it falls to the ground, but retains its vitality for some weeks, by which time a victim may probably have germinated. As soon as it touches

a living plant it twines firmly round it, and a series of small wart-like adventitious roots (*haustoria*) are developed, from the centre of each of which a bundle of suctorial cells force their way through the epidermis and cellular envelope into the bast, and press against the woody tissue of the host. The portion of the dodder stem below this attachment now dies off, and there is then no longer any connection with the ground. The growing point again circumnates until it finds a new base of attachment upon the same or a different stem of the host, there to repeat the formation of suckers. In this way a tangled skein of threads is formed, over which, late in the season, the flowers, generally pink, develop in dense clusters, and the black seeds are shaken out of the capsule by the wind, or gathered with the crop. This parasite is often very injurious, fields of flax, clover, and lucerne sometimes showing well-marked patches completely desolated by the pest. These have to be mowed down and burned before new seed has set; while pains must be taken to procure seed free from those of the parasite. Preventive measures are, to make careful examination of the seed (see SEED TESTING), rejecting any that contains dodder seed and any produced upon land known to be infested by dodder. Manure of stock fed upon baled hay should always be viewed with suspicion, because the germinating qualities of dodder seeds are not impaired during digestion. When observed growing among a crop, frequent hoeing and burning are often satisfactory. Pasturing with sheep confined to the infested patches is also practised, the animals being kept for several weeks upon the land and given extra food if necessary. The most satisfactory treatment, however, is clean cultivation or the growing of a crop upon which the dodder cannot grow. There are about 100 species of dodder of wide geographic distribution, of which at least 25 are found in the western and southern parts of North America. The temperate species are all annual, but some of the tropical species are perennial. A common American name is tanglewood. It is a remarkable circumstance that *Cassytha*, a totally unrelated Oriental genus of *Lauraceae*, has not only assumed the same general mode of life, and the twining, leafless habit, but germinates and penetrates in a precisely similar way.

Doddridge, dōd'rīj, Philip, English Nonconformist clergyman and author: b. London 26 June 1702; d. Lisbon, Portugal, 26 Oct. 1751. He determined to enter the Nonconformist ministry and was educated at a theological academy at Kibworth, Leicestershire. In 1723 Doddridge became pastor of the dissenting congregation at Kibworth. After declining several invitations from congregations whose rigid ideas of orthodoxy he felt would be uncongenial to him, he settled in 1729 at Northampton as minister and president of a theological academy. Here he continued to preach and train young students for the ministry till shortly before his death. Doddridge was at once liberal and evangelical, and with all his religious earnestness and enthusiasm had humanity enough for such levities as cards and tobacco. His principal work is 'The Rise and Progress of Religion in the Soul' (1745), which has been translated into Dutch, German, Danish, French, and even Syriac and

DODDS — DODGE CITY

Tamil. Besides this, may be mentioned 'The Family Expositor' (1739-56); his 'Course of Lectures,' delivered to the students under his charge, and published (1763); and a great variety of sermons on miscellaneous religious topics. His hymns, nearly 400 in number, have carried his name over the English-speaking religious world, perhaps the best known being 'Hark, the Glad Sound, the Saviour Comes'; and 'O God of Bethel, by Whose Hand.' His 'Correspondence and Diary' appeared 1829-31. See Orton, 'Life of Doddridge' (1766); Sanford, 'Life of Doddridge' (1881).

Dodds, Alfred Amedée, French military officer: b. St. Louis, Senegal, 6 Feb. 1842. He was educated at the Lyceum of Carcassonne and at the military school of Saint-Cyr, and entered the French army as sub-lieutenant in 1864. In 1894 he commanded the expedition which resulted in the conquest of Dahomey and the dethronement of King Behanzan. He was appointed commander-in-chief of the French forces in Indo-China in 1896. He became an officer of the Legion of Honor in 1883, commander in 1891, and a grand officer in 1892.

Dodecahedron, dō-dēk-a-hē-drōn, a regular solid bounded by 12 equal and regular pentagons, or having 12 equal bases. A solid having 12 faces.

Dodge, Charles Richards, American textile fibre expert: b. Covington County, Miss., 17 July 1847. He was educated at the Sheffield Scientific School of Yale and was assistant entomologist in the United States Department of Agriculture 1867-77, editing 'Field and Forest' 1874-7. Since 1890 he has been in charge of the fibre investigations of that department. He has published 20 special reports on fibres and fibre industries, including a 'Dictionary of the Fibre Plants of the World.'

Dodge, Grenville Mellen, American soldier: b. Danvers, Mass., 12 April 1831. He was educated at Partridge's Military Academy and Norwich University. He served in the Federal army during the Civil War. After the War he was chief engineer of the Union Pacific Railroad and superintended its construction, and was a member of Congress from Iowa in 1867-9. He succeeded Gen. Sherman as president of the Association of the Army of the Tennessee in 1894, and was also president of the New York Commandery of the Loyal Legion. In 1898 he was made chairman of the President's Commission to inquire into the management of the War Department in the war with Spain.

Dodge, Mary Abigail (pseudonym, "GAIL HAMILTON," American author: b. Hamilton, Mass., 1830; d. there 17 Aug. 1896. For several years she was instructor in the High School at Hartford, Conn. From 1865 to 1867 she was one of the editors of 'Our Young Folks.' Besides numerous contributions to current literature, she wrote: 'Gala Days' (1863); 'Woman's Wrongs' (1868); 'The Battle of the Books' (1870); 'Woman's Worth and Worthlessness' (1871); 'The Insuperable Book' (1885); 'A New Atmosphere' (1864); 'Red-Letter Days'; 'Country Living and Country Thinking'; 'A Washington Bible Class'; 'Twelve Miles from a Lemon' (1873); 'Biography of James G. Blaine'; 'Our Common School System' (1880).

Dodge, Mary Elizabeth Mapes, American editor, author, and poet: b. New York 1838. Since 1873 she has been the editor of 'St. Nicholas Magazine' (New York). Her best-known work is 'Hans Brinker, or the Silver Skates' (1876), which has gone through many editions and been translated into five foreign languages. Among her other works, chiefly for young readers, are: 'Irvington Stories' (1864); 'Theophilus, and Others' (1876); 'Donald and Dorothy' (1883); 'The Land of Pluck'; 'Along the Way,' a collection of poems (1879).

Dodge, Richard Irving, American military officer and writer: b. Huntsville, N. C., 19 May 1827; d. Sackett's Harbor, N. Y., 16 June 1895. He was graduated at the United States Military Academy in 1848. He was the author of 'The Black Hills' (1876); 'The Plains of the Great West' (1877), republished in London as 'Hunting Grounds of the Great West'; and 'Our Wild Indians' (1881).

Dodge, Theodore Ayrault, American military officer and writer: b. Pittsfield, Mass., 28 May 1842. He received his military education abroad. Returning to the United States, he enlisted (1861) in the Union service as a private, attaining the rank of colonel, 2 Dec. 1865. He has published: 'The Campaign of Chancellorsville' (1881); a 'Bird's-Eye View of the Civil War' (1883); 'Patroclus and Penelope: a Chat in the Saddle' (1885); and a series of studies called 'Great Captains,' comprising volumes on 'Alexander the Great' (1890), 'Hannibal' (1891), 'Caesar' (1892), 'Gustavus Adolphus' (1895).

Dodge, Walter Phelps, American author and lawyer: b. of American parents in Syria 1869. He is a nephew of William Walter Phelps (q.v.). Among his works are: 'Three Great Tales'; 'As the Crow Flies'; and 'A Strong Man Armed.'

Dodge, William Earl, American capitalist: b. Hartford, Conn., 4 Sept. 1805; d. New York 9 Feb. 1883. He received a common school education, entered the wholesale drygoods business, and in 1833 became a member of the firm of Phelps, Dodge & Company, retiring in 1879 with a large fortune. He was president of the New York Chamber of Commerce, trustee of Union Theological Seminary, a founder of the Union League of New York, and an ardent friend of the freedman.

Dodge, William Earl, American merchant, son of the preceding: b. New York 15 Feb. 1832; d. Bar Harbor, Me., 9 Aug. 1903. He succeeded his father in the metal firm of Phelps, Dodge & Company, New York, and was long prominent in his native city as a man of business, philanthropist, and art patron. He was the first vice-president of the American Museum of Natural History and chairman of the Executive Committee of the Metropolitan Museum of Art, in which latter position he had been very active. He gave Earl Hall to Columbia University.

Dodge City, Kan., town, county-seat of Ford County; on the Arkansas River, the Atchison, T. & S. F., and the Chicago, R. I. & P. railroads; about 150 miles west of Wichita. When first settled, as a Texas cattle-shipping point, the place was noted for its lawlessness. It is the trading centre of an agricultural and stock-raising region. It is the seat of Soule Col-

lege, which is under the control of the Methodist Episcopal Church. Pop. 2,000.

Dodgeville, Wis., city, county-seat of Iowa County, situated on the Illinois C., and the Chicago & N. W. railroads, about 50 miles southwest of Madison. The industries of the place are chiefly those of an agricultural region, notably creameries. The lead and zinc mines nearby add to the wealth of the city. Pop. (1900) 1,865.

Dodgson, dōj'son, Charles Lutwidge ("LEWIS CARROLL"), English mathematician and author: b. 1833; d. Guildford 14 Jan. 1898. He took orders in 1861, and till 1881 was a mathematical lecturer. His first publication was 'A Syllabus of Plane Algebraical Geometry' (1860); in the following year he issued the 'Formulæ of Plane Trigonometry,' and in 1864 appeared his 'Guide to the Mathematical Student.' He still remained quite unknown to the public at large, but in the next year became famous as the author of 'Alice's Adventures in Wonderland,' which, though written for the young, has found not less appreciation among those of riper years, and has been translated into many languages. Equally delightful is the continuation of Alice's adventures narrated in 'Through the Looking-glass and what Alice Found There' (1871), an exception to the common rule as to the inferiority of continuations. Both books were admirably illustrated by Tenniel. 'The Hunting of the Snark: an Agony in Eight Fits' (1876), a fantastic narrative in verse, had by no means an equal popularity, however. Among his other works are: 'Elementary Treatise on Determinants' (1867); 'Phantasmagoria and other Poems' (1869); 'Euclid and His Modern Rivals' (1879); 'Rhyme? and Reason?' (1883); 'A Tangled Tale' (1885); 'The Game of Logic' (1887); 'Curiosa Mathematica' (1888 and 1893); 'Sylvie and Bruno' (1889-93); and 'Symbolic Logic' (1896).

Dod'let, a name sometimes applied to the tooth-billed pigeon (q.v.), (*Didunculus strigirostris*), of the Samoan Islands.

Dodo, dō'dō, or Dronte (*Didus ineptus*), the name of a very remarkable extinct bird discovered by the Portuguese, about 1507, on the island of Cerne or Mauritius; and afterward seen there by the Dutch, both at the end of the 16th and in the beginning of the 17th century. The last authentic record shows its survival until 1681. As it was never seen after this, it was deemed by some altogether fabulous; but its actual existence was completely established not only by drawings made by artists who accompanied the Dutch voyagers, and preserved in Utrecht, Vienna, and Berlin, but by fragments of the bird itself; among others, a foot in the British Museum, and both a head and a foot in the Ashmolean Museum, at Oxford. Several other fragments, and even entire embalmed birds, reached certain of the continental museums, but seem to have been mostly lost or destroyed. In 1865, and again in 1889, large numbers of bones of the dodo were found in a marsh in Mauritius, from which an almost complete skeleton has been set up in the British Museum, and others distributed to various collections. The dodo had short and ill-shaped legs and feet, scarcely able to support its clumsy and almost globular body, which was

about twice as large as that of a turkey; and a monstrous head which, apparently ill-attached to its body, contained an enormous mouth and terminated in a strong hooked beak. Though covered with thick plumes, it was destitute of wings sufficient for flight, and had their place supplied by mere stumps or rudimentary appendages, covered with soft ash-colored feathers, intermixed with yellowish-white; the tail was composed of a few small curled feathers of the same description. Naturalists are now agreed that the dodo should be put in the order *Columba* (q.v.) or pigeons, of which it, with one or two similarly extinct birds from neighboring islands, is the representative of an extremely modified family type (*Didida*). The cause of the extinction of the dodo, together with several of its associates in the land fauna of Mauritius, is said to have been the hogs which, let loose from the ships of the early explorers, multiplied greatly and overran the island. Consult: Strickland and Melville, 'The Dodo and its Kindred.'

Dodona, dō-dō'nā, a celebrated town in Epirus, in the neighborhood of which was one of the most ancient oracles in Greece. This oracle long maintained its celebrity. It belonged to the Pelasgic Zeus, who was supposed to dwell in the stem of an oak-tree. The prophetic priestesses announced the divine communications in different ways. They approached the sacred tree, and listened to the rustling of its leaves; or, standing by the fountain at the foot of the tree, observed the murmuring of the water which gushed forth from the earth, and in other ways. The sanctuary at Dodona was destroyed by Dorimachus, the Ætolian general, in 219 B.C. See ZEUS.

Dods, Marcus, Scottish theologian: b. Belford, Northumberland, 1834. He was educated in Edinburgh, and in 1858 was licensed as a minister of the Free Church of Scotland. In 1866 he was ordained to Renfield Free Church, Glasgow, where he remained till appointed in 1889 to the chair of New Testament exegesis in New College, Edinburgh. Among his published works some of the most important are: 'The Prayer that Teaches to Pray' (1863, 6th edition 1889); 'Epistles to the Seven Churches' (1865); 'Israel's Iron Age' (1874); 'Mohammed, Buddha, and Christ' (1877); 'Handbook on Genesis' (1882); 'Parables of Our Lord' (1883 and 1885); 'How to Become Like Christ' (1897); 'Genesis, John, and First Corinthians in the Expositor's Bible.'

Dods'ley, Robert, English dramatist and bookseller: b. Mansfield, Nottinghamshire, 1703; d. Durham 25 Sept. 1764. He became a footman, and published by subscription a volume of poems, entitled the 'Muse in Livery,' which attracted public favor, less from its intrinsic merit than from the situation of the author. His next effort was the 'Toyshop,' a dramatic satire. Pope patronized this, and through his influence it was brought upon the stage in 1735. Dodsley was enabled, by his profits as an author, to set up a bookseller's shop in Pall Mall, which ultimately proved very prosperous. He next wrote the farce of the 'King and the Miller of Mansfield,' founded on an old ballad, which succeeded so well that he produced a sequel to it, called 'Sir John Cockle at Court.' In 1741 he brought out a musical piece, entitled the 'Blind Beggar of Bethnal Green.' He subsequently wrote:

DODSON — DOG

'Economy of Human Life,' a well-known collection of moral maxims; a tragedy, 'Cleone'; and a selection of fables in prose, with an 'Essay on Fables' prefixed. He planned the 'Preceptor'; the 'Annual Register' (commenced in 1758); the 'Collection of Old Plays,' which now chiefly sustains his fame as a publisher; and the 'Collection of Poems by Different Hands.'

Dodson, John E., American actor: b. England 1857. He studied law, but early in life went on the stage, appearing first in Manchester; he supported Charles Manchester and other star players in England; and in 1889 came to the United States with Mr. and Mrs. Kendal. His first appearance in New York was at the Fifth Avenue Theatre in 'A Scrap of Paper'; later he joined the Empire Theatre Company as leading comedian. He originated the character of Richelieu in 'Under the Red Robe,' and has taken the part of Richelieu in 'Richelieu's Stratagem,' and the part of John Weatherby in 'Because She Loved Him So.'

Dodwell, Henry, English critic and theological writer: b. Dublin 1641; d. 1711. In 1688 he was chosen Camden professor of history at Oxford. After the revolution, his high-church principles inducing him to espouse the cause of the non-jurors, he was deprived of his office. He produced a multitude of works relating to theological and classical literature. Of these the most valuable is entitled 'De Veteribus Græcorum, Romanorumque Cyclis, Dissertationes X., cum Tabulis Necessariis.'

Doe, John, and Richard Roe, two fictitious personages in law who formerly appeared in a suit of ejectment. The former was the plaintiff and the latter the defendant. The fiction on which their appearance was based was abolished by the Common Law Procedure Act, and now accordingly they do not appear in England. In American usage, attempts have been made to substitute other names, but in proceedings where the identity of the alleged criminal is not known, or is designedly concealed for any reason, John Doe is the favorite term employed.

Does, doos, Jacob Van Der ('THE ELDER'), Dutch painter: b. Amsterdam 4 March 1623; d. 17 Nov. 1673. After study with local masters, he lived in France and Italy, painting landscapes of merit, but dark and spiritless in many instances. He had two sons, Jakob and Simon, both painters of note.

Doffer (doff, to put off), a small and slowly revolving cylinder, which strips the cotton or wool from the cards on the main cylinder of a carding machine.

Dog, a mammal of the order *Carnivores*, family *Canida*. The origin of the domesticated dog is unknown, but probably it is of composite descent from the jackal, with a certain admixture of wolf indicated, or possibly these have been intermingled with the blood of dog races tamed by men in different parts of the world. When the different tribes and races of men drifted about the earth's surface they took their dogs with them and no doubt breeds were mixed and races exchanged. By naturalists and writers in times gone by, dogs have been divided into groups, but for practical purposes at the present time they are divided into two classes:—sporting dogs and non-sporting dogs. Contro-

versies still rage as to the origin of certain classes of dogs, but almost all hounds that run by scent and the greyhound that runs by sight were of Persian, or at any rate Asiatic origin. The pointer in scientific parlance is the same dog as the hound, and the setter is a large spaniel. The Molossus of the ancient Greeks may be the same as the Thibet mastiff, and progenitor of the Great Dane, boarhounds, mastiffs, and possibly the bulldog.

The main characteristic of the dog is his reliance on man, upon whom he looks as head of the pack. Wild breeds of dogs are the Australian dingo, the Cape hunting dog, the raccoon dog, the Hindoo dhole, and the Venezuelan mountain dog now merged with the Guariquin dog.

In enumerating the breeds we have to deal with at the present day the following comprises the category as met with at the leading dog shows held under the auspices of recognized kennel clubs, or that are used in the ordinary vocations or sports of life:

Non-sporting Dogs	
Mastiff.	Toy Spaniel.
St. Bernard.	Japanese Spaniel.
Newfoundland.	Maltese.
Collie.	Pomeranian.
Smooth Collie.	Italian Greyhound.
Bobtail Sheepdog.	Schipperke.
Poodle.	Chow Chow.
Dalmatian.	Chihuahua.
Bulldog.	Bull Terrier.
Pug.	Boston Terrier.
Sporting Dogs	
Bloodhound.	Irish Water Spaniel.
Foxhound.	Clumber Spaniel.
Staghound.	Sussex Spaniel.
Harrier.	Black Field Spaniel.
Beagle.	Norfolk Spaniel.
Otterhound.	Cocker Spaniel.
Deerhound.	Bassetthound.
Greyhound.	Dachshund.
Whippet.	Fox Terrier.
Great Dane.	Scottish Terrier.
Wolfhound.	Skye Terrier.
Borzoi (Russian Wolfhound).	Irish Terrier.
Pointer.	Welsh Terrier.
Setter.	Dandie Dinmont.
Retriever.	Airedale.
	Bedlington.

The interests of the dog and its betterment in breed and those qualities that make the animal valuable are looked after by clubs and associations principally in the United States, England, France, Germany, Austria, Russia, Italy, Australia, and South Africa, in which countries official shows are held at stated times and the rules governing these organizations are recognized so far as breeds are concerned by these governments. A large number of illustrated magazines and journals in all parts of the world are devoted to the interests of the canine race. The principal ones in England are: 'Our Dogs'; 'Stock-keeper'; 'Illustrated Kennel News'; and 'The Field'; in the United States: 'Rider and Driver'; 'Field and Fancy'; 'Dog Fancier'; 'The Kennel'; 'The Sportsman's Review'; 'Stock-keeper'; 'The Field'; and 'The Dog.'

BLOODHOUND.—In general appearance this noble animal impresses one as the most dignified of any dog. The head is long and clean with tremendous wrinkles and pendulous ears, the eye is small and deeply set, and shows much of the hawk. The old fallacy of bloodhounds being ferocious is absurd; they hunt or trail persons by scent and on finding their quarry do

DOG

not attack, but stand baying until the pursuers arrive.

Standard.—Skull long, narrow, and very much peaked; muzzle deep and square; ears set on very low, thin, and hanging in graceful folds close to the face; deep-set eyes, with triangular lids showing the red haw; flews long, thin, and pendulous, the upper lip overhanging the lower one; neck long, with profuse dewlap; skin of face very loose and wrinkled; coat close; skin thin; shoulders deep and sloping; brisket well let down; loins broad and muscular; powerful thighs and second thighs; good legs; round feet; hocks well bent; tapering stern. Colors: black and tan, red and tan, and tawny.

St. BERNARD.—This magnificent dog takes its name from the monastery of Mt. St. Bernard, Switzerland, and is remarkable for its high order of intelligence. It was used by the monks for rescuing travelers lost in the snow. The old type which was small and somewhat plain in head is fast dying out, the present show specimens being more on the mastiff type of head.

Standard.—Head very massive and large, showing great depth from eye to lower jaw; face rather short, muzzle wide, deep, and cut off square; lips hanging down well and rather loose, the stop well defined, but not too abrupt; skull massive and well rounded; eyes dark in color, of medium size, rather deeply set, the lower eyelid drooping slightly, so as to show a little of the red haw; ears rather small, lying well to the cheek, and very slightly feathered in the rough variety; nose black in color, wide, and deep, legs straight, with great bone and muscle; hocks and stifle well bent; feet large and compact; body rather long, broad, straight, and ribs well rounded. The coat of the smooth- or short-coated variety should be very close, thick, and slightly broken-haired. In the rough variety the coat should be dense and flat, of medium length, not woolly, rather long on the neck, thighs, and tail. Color and markings: orange, orange-tawny, and all shades of brindle and red. The markings should be as follows: White muzzle, white blaze on face, shaded with black, black shadings on the ears, white collar round neck, and white on chest, legs, and tip of tail. The body may be white with patches of any of the above colors.

GREAT DANE.—This dog is a most symmetrical animal, and the embodiment of agility and strength. They were originally used in Denmark and Germany for boar and deer hunting. They make ideal watch dogs.

Standard.—Head, which should be carried high, long and not too broad; muzzle broad, strong, and blunt; eyes small, with sharp expression; neck long and arched, free from dewlap; chest moderately broad; brisket deep; loin slightly arched; shoulders sloping; elbows well under; belly well drawn up; legs straight and muscular; second thighs long and strong; feet large, well arched, and close; coat hard and dense; tail strong at root, and ending fine, carried rather low. Colors: brindle, fawn, harlequin, black, white, and blue.

MASTIFF.—In this old breed we have probably the most massive and ferocious looking of dogs.

Standard.—Head large and massive; skull flatly rounded; ears small; muzzle square, deep and broad; teeth level; eyes brown or hazel-colored, and wide apart; front legs straight,

with great bone; chest deep; loins strong and large as possible; color, brindle or fawn; in both cases muzzle and ears black; size as large as possible, so long as symmetry is retained.

NEWFOUNDLAND.—This noble dog is famed for his remarkable fearlessness of water and the readiness with which it will risk its life to save human beings from drowning. The black dog, which is spoken of as the true Newfoundland, is a trifle larger than the Landseer type, which is a black and white dog. Much controversy has taken place as to whence white markings came, some claiming a spaniel cross.

Standard.—Head broad and massive with flat skull and somewhat square muzzle; ears small and lying close to the head; coat straight and dense and capable of resisting water; tail carried gaily, but not curled over; color black, black and white, or bronze; average weight, 100 pounds for dogs and 85 pounds for bitches.

POINTER.—That this breed was descended from the hound was first clearly indicated by Youatt. The disposition to point appears to be due to training, and although other dogs have been taught to point, in no case do they assume the same rigid position so notable in the pointer. This breed is marked by a compact and well knit body, sloping shoulders, muscular limbs, and beautiful action. The head is large and flat, stop well defined with a depression running from the top to occiput, muzzle long and square, with not too much lip. Colors are white with black, liver, and orange markings, and solid black and liver.

GREYHOUND.—The English greyhound, which is of great antiquity, has been regarded by some as the ancestral stock of the majority of our domestic dogs, but this is doubtful. It is easily distinguished at a glance from all other dogs by its graceful outline and large size. Greyhounds hunt entirely by sight instead of scent.

Standard.—Head long and lean, rather wide between the eyes and flat at the top; jaw powerful, but cleanly cut; teeth level and white; eyes bright; ears small and fine in texture and rose-shaped; neck long and muscular, elegantly arched, and free from throatiness; shoulders oblique and muscular; chest deep and capacious; back broad and square, rather long and slightly arched over loins which should be strong and powerful; forelegs rather long and set under dog, possessing fair amount of bone; hind quarters strong and broad across, stifles well bent, thighs broad and muscular, hocks well let down; feet round, well split up with strong soles; tail long, tapering, and nicely carried; coat fine and close; color, black, red, white, brindle, fawn, blue, and the various mixtures of each.

WHIPPET.—This breed is the result of a cross between a greyhound and a terrier, and is bred especially for rabbit coursing and racing. In the latter sport these dogs are without doubt the most speedy animals known, even exceeding the speed of the racehorse for a short distance. In outline they are identically the same as the greyhound.

STAGHOUND.—It is a large hound, white in color with black and tan markings; the head somewhat on the pointer type, but the ears more pendulous and set lower. This breed has been used for many years in Europe for stag hunting.

DEERHOUND.—The Scotch deerhound is larger and more massive than the English greyhound, frequently standing as high as 28 to 30

1. English Setter.
2. Greyhound.
3. Irish Terrier.
4. Great Dane.

5. Poodle.
6. Bull Terrier.
7. Russian Wolfhound.
8. Collie.

DOG

inches at the shoulder, the body being clothed with a rough coat. Its principal use is for deer-stalking in the Highlands.

Standard.—Head long and narrow, tapering gradually from the ears; nose black (occasionally blue) and pointed; lips level; ears small, set high, carried in a fold, soft and silky, and free from long hair; neck long, but strong, with the nape or crest very prominent; shoulders sloping; toes close and arched; chest deep; body long, but well ribbed up; loins arched with great breadth across hips; stifle well rounded; thighs long; tail set on low, curved but not curled; coat rough and harsh on body; mane on neck and slight fringe on inside legs, on thighs and on tail. Colors: All shades from dark blue or black brindle to light gray brindle, yellow, fawn, dun, and drab; white markings objectionable, but very often to be found on chest and toes.

IRISH WOLFHOUND.—This ancient breed was famous for many years in Ireland for its great power and strength and its prowess against wolves. It has practically the same lines as the deerhound only more massive in skull and body. The colors are the same.

BORZOI or RUSSIAN WOLFHOUND.—Is of rather larger build than his English cousin, being covered with a wavy silky coat quite different in texture from that of the deerhound and wolfhound; the head is more domed and muzzle of the Roman nose type. It is used in Russia for hunting wolves. Colors are white with drab, fawn, or brindle markings.

ITALIAN GREYHOUND.—This breed is kept purely as pets and may be regarded as a miniature greyhound. The eyes are much larger and more prominent than in the large greyhound. There are several colors, among which are a golden fawn and a mouse fawn, the most valuable colors; white markings are undesirable.

ENGLISH FOXHOUND.—The modern foxhound is somewhat smaller than the staghound and cobbler in body; the head is cleaner with more substance in the muzzle; the ears are rounded and placed much higher on the skull. The American foxhound is much the same type, but somewhat smaller and lighter built, the colors often being black and tan, showing a bloodhound cross.

BEAGLE.—This term is generally applied to any hound standing less than 15 inches high, although the true pure breed beagle is a distinct breed, which may be regarded as a miniature foxhound with the exception of the ears, which are more pendulous; the height varies from 9 to 15 inches. The beagle has a musical note and an acute scent as well as great perseverance in following a trail.

SETTERS.—The various breeds known as setters are practically large spaniels which acquired this name from being taught to crouch when marking their game.

ENGLISH SETTER.—It is regarded as a result of a cross between the field spaniel and the pointer, and should have a soft coat with a slight wave, but no curl in the hair. There is a great variation in color, which is valued according to the following scale: black and white ticked with large splashes, or the Blue Belton; then orange and white freckled, known as the "Orange Belton"; black and white with tan markings; and black and white.

Standard.—Head long and lean with a flat skull; muzzle long and deep; lips not too pen-

dulous; ears of moderate size, fine in texture, set on bone, and well back; neck long, muscular, and well set in sloping, deep shoulders; chest narrow, but deep, and ribs well sprung; loins muscular and slightly arched, with powerful hind quarters; front legs perfectly straight, and feet small and firm; toes arched and close together.

IRISH SETTER.—Of a deep-red mahogany color, this dog is rather lighter in build than the English setter, with a narrow and slightly domed head.

THE GORDON or black and tan setter is much heavier than either the English or Irish breeds, this heaviness being especially shown in the head, which is broader and deeper. The body should be massive and black with tan markings.

RETRIEVER.—This name applies to a large dog somewhat on the order of the setter, employed for retrieving game. They have more or less Newfoundland blood in them and trace their parentage to the water spaniel or setter. The curly-coated retriever, which may be either black or liver color, is the product of a cross between the smaller black Newfoundland and the Irish water spaniel. It is characterized by the short hair of the face and the tail devoid of any fringe, although covered to within a few inches of its extremity with short, crispy curls. The hair on the body is closely and crisply curled, hence the old phrase of the "nigger-coated retriever," a term used in some counties in England. The wavy or flat-coated retriever has the same outline, with the exception of the coat, which is flat and wavy, and is close to the body.

CHESAPEAKE BAY DOG.—As the name signifies, this dog is a native of Chesapeake Bay. It resembles a dull-colored red retriever both in color, shape, and size. The coat is extremely dense and absolutely waterproof. For general retrieving work in the water we know of no dog which can equal it. It has been known to work the whole day in the ice and never seems to tire.

SPORTING SPANIEL.—The Clumber spaniel derives its name from Clumber Park, the estate of the Duke of Newcastle, where this breed has been kept for many generations. The Clumber is distinguished by its silence when hunting, and is a large, low, heavy, massive dog, with immense bone.

Standard.—Large, low, heavy, and massive throughout, with immense bone; head large, with largely developed forehead; brows heavy and eyes deeply set; muzzle long and very square, with a fair quantity of lip; ears small when compared with the size of the dog, and well shaped, hanging close to the face. Color is white with lemon markings.

FIELD or BLACK SPANIEL.—It is somewhat on the Clumber style, but has much more activity, a longer muzzle and cleaner head.

Standard.—Head long and lean, with a good length of muzzle, which must not be snippy; a short, coarse, or clumpy head is objectionable; eyes dark; ears very low down, narrow where they leave the head, long and lobe-shaped; body large, deep, long, and low; tail carried below the level of the back; legs straight, strong, short, and very large in bone. Although a long, low dog, he must be active, with plenty of life, and any resemblance in shape, action, or movement to the bassetthound or dachshund should be discarded.

COCKER SPANIEL.—The weight of this variety of spaniel at exhibitions is usually under 26 pounds. The head is long and narrow, but not quite so lean or long as the field spaniel, the muzzle well developed and not snippy; eyes dark, and although not full or prominent, a little larger in comparison with the size of the dog than the eye of the field spaniel; ears long, and small near the head, set low, and lobe-shaped; body large, deep, and round throughout, and in length much shorter than in the field spaniel; stern set low; legs powerful and straight, and a little longer than the field spaniel; and coat flat and abundant, but not too long; and with plenty of feather. It should be remembered that, although a small spaniel, the cocker is a sportsman's dog, and any trace in shape, make, expression, or action of the toy spaniel should be discarded.

IRISH WATER SPANIEL.—This quaint animal is possibly the most useful all-around worker of the whole group of spaniels. The general appearance is that of a big upstanding shaggy liver-colored dog with a strong head and a distinct top-knot, a well furnished cobby body, and a rat-like tail. These dogs are especially fond of the water and good on all retrieving work.

DALMATIAN.—The Dalmatian or coach dog is probably allied to the pointer. It is distinguished by the spots which are black or liver, on a white ground. Its use in England and America is essentially as a carriage dog, and it devotes itself entirely to the horse, often sleeping in the same stall. In its native country the Dalmatian is used as a pointer and is said to be staunch on game.

Standard.—Head longish, skull flat, moderate amount of stop; muzzle long and powerful; eyes medium size, and dark or light according to markings; neck fairly long and arched, no throatiness; chest very deep, not wide under; feet compact, well padded; tail smooth, slightly curved upward; coat short, hard, dense; ground color pure white; spots pure black or liver color; very decided, not intermixed; ears and tail well spotted; weight 50 pounds. The general appearance is that of a pointer.

SHEEP DOG.—The Collie is essentially of Scotch origin. In appearance it is one of the most handsome of the canine race, having a well-knit frame, chest deep, but not wide; fore legs straight, hocks well bent, feet compact and strong. The head should be long, fairly narrow, and flat; ears small, set well back on the head, and carried semi-erect, but not pricked. Colors are black and tan, black, tan and white, sable, and sable and white.

SMOOTH COLLIE.—Is practically on the same lines as the rough collie, with the exception of the coat, which is smooth and lies very close, and the eyes, which, in many cases, are china or wall-eyed, that is of a whitish color.

OLD ENGLISH (BOBTAIL) SHEEP DOG.—This quaint old breed is quite different in type from the other sheep dog, having a short, wide skull and very massive body, which is covered with a rough, shaggy coat, with an abrupt, or bob-tail, hence the name. Is much used in England by the drovers and is locally known as the drover's dog.

Standard.—Color, any shade of blue, blue merle or grizzle, with white on face or legs for relief; head big and square; eyes small and dark; in very light-colored dogs wall or

marble; square in body and as large as possible, with a broken, harsh, wavy coat; ears small and neatly set on side of head.

BEARDED COLLIE.—Is practically a repetition of the bob-tail, with the exception of the tail, which is long and carried low, and the body, which is not quite so short or massive.

BULL-DOG.—This breed is, without doubt, the most maligned of the canine race. In appearance it is that of a low cobby dog, with a very large flat skull, showing much wrinkle, short nose or face and a long, wide turned-up under-jaw. In body is low and wide in front, with well sprung ribs and a short roach or wheel back, and a short, tapering tail, which must not be carried above the level of the back. Since the old-time sport of bull-baiting has been done away with the bull-dog has been bred especially as a pet. They are, in no way, fighters, being, without doubt, the most affectionate of all breeds.

Standard.—Thick-set and compact; very heavy in front, and of comparatively lighter build behind; legs short, muscular, and set outside the body, but not exaggerated; shoulders massive, and standing well out; chest wide and deep; skull large; and temples high, with stop well defined; eyes wide apart, and dark in color; underjaw wide, and well turned up; nose large, black, and very short; strong loin, well tucked up; tail short and set on low; colors, all shades of brindle, fawn, white, and all pied colors.

TERRIER.—The bull terrier, as its name implies, is a cross between the bulldog and the white English terrier. The general appearance is that of a symmetrical animal, the embodiment of agility, strength, and determination. The ears are cropped, which gives a smart and alert appearance. The popular color is pure white with small black eyes and nose; a cherry or flesh-colored nose is undesirable.

Standard.—Head long, flat, and wide between ears, tapering to nose without cheek muscles, slight indentation down face, without a stop; jaws long and very powerful; large black nose, and open nostrils; eyes small and very black; lips meeting as tightly as possible without a fold; teeth regular in shape and meeting exactly, a deviation being a great fault; ears always cropped; neck long, slightly arched, nicely set in shoulders, tapering to head, without any loose skin; shoulders strong, muscular, and slanting; chest wide and deep; ribs well rounded; back, short and muscular; fore legs perfectly straight, with well developed muscles, not "out at shoulder," and very strong in pasterns; hind legs long, muscular, and good strong, straight hocks, well let down; feet like those of a cat; color white; coat short, but close, stiff to the touch, and with fine gloss; tail set on very low, and 10 to 12 inches long, thick where it joins the body, tapering to a fine point, carried without a curl and never over the back.

AIREDALE TERRIER.—This is a large, rough-coated terrier, found chiefly in Yorkshire, England. It derives its name from the river Aire, where it is much used for all hunting purposes. The general appearance is that of a big, rough-coated dog, on the same lines as the Irish terrier, but much stronger and heavier built. The colors are black and tan, and grizzle and tan, and the weight from 40 to 55 pounds. The coat should be short, very dense, and of a harsh texture.

1. Smooth Fox Terrier.
2. Clumber Spaniel.
3. Basset Hound.
4. French Bulldog.

5. English Bulldog.
6. Pomeranian.
7. Pug.
8. Boston Terrier.

DOG

SCOTTISH TERRIER.—The general appearance is that of a low cobby rough-coated terrier with prick ears. The head should be long and narrow, with small, dark eyes and a long punishing jaw; the front legs straight, and shoulders strong, but not too broad; body short and the tail carried gayly; weight from 14 to 20 pounds; colors, wheaten, red and black brindle, and solid black. White markings are objectionable.

SKYE TERRIER.—This is, undoubtedly, the old Highland terrier, a long, low dog, with a long, straight coat of dark steel blue, or gray color; head broad and strong, with a long jaw; nose pointed, and eyes small, dark, and set close together; body long and low, but arched at the loins, and tail carried low, and ears pricked or drop, the latter carried low and close to the head.

DANDIE DINMONT TERRIER.—This game little terrier is also of Northern origin. It is low on the leg and strongly built. The head is apparently large in proportion to size; skull fairly wide and covered with a top-knot of silky, light hair. Colors are pepper or mustard; tail carried gayly above; weight not over 25 pounds.

BEDLINGTON TERRIER.—This breed hails from the northeastern counties of England. It is rather long and wiry in appearance, with a bluish, or sand-colored coat. The head is long and narrow, with a silky top-knot, somewhat like the Dandie, but is much narrower in skull. These dogs are exceedingly game and weigh 12 to 18 pounds.

WELSH TERRIER.—As the name implies, these little dogs come from Wales. They are, in general appearance, much like the Airedale and of the same color; the head is broader in comparison and eyes set wider apart. The weight should not exceed 20 pounds.

YORKSHIRE TERRIER.—This is a small breed, bred chiefly in the county of Yorkshire, and is easily distinguished by its very long, silky coat, especially on the face, which is parted from the nose down the whole length of the body to the tail. It is exceedingly bright and quite game, but valued chiefly as a pet. The colors are a dark blue body, with tan markings; and black with tan markings. The ears are cropped and carried erect, and the weight is between three and eight pounds.

MALTESE TERRIER.—This dog is on the same lines as the Yorkshire, but a trifle larger, colored pure white, with a black nose and small, deep-set eyes. The coat should be flat and not curly, which, in many cases, shows a toy poodle cross.

MANCHESTER OR BLACK AND TAN TERRIER.—A smooth-coated terrier which has been bred for many years in Manchester, England, derives its name thence. The general appearance is that of a smart dog with a black body and rich tan markings on the legs and feet; the division between the colors should be well defined. The ears are cropped or V-shaped. The weight is from 7 to 20 pounds. The toy black and tan is identically the same breed, but does not exceed seven pounds in weight.

DACHSHUND.—This quaint and very game breed is essentially of German origin. The general appearance is that of a dwarfy short-legged, long-bodied, but sturdy dog, with strongly developed muscles. The head is long and fairly broad, conical in shape, tapering toward the nose, with ears set high and broad and nicely

rounded, not pointed or folded. The legs should be short and muscular, but not over at the knees; elbows well under, and shoulders broad and well placed; loin short, firm, and broad; and tail short, but carried gayly. Colors are solid red, black and tan, and dappled. The coat should be smooth and glossy. The rough-coated variety, which is now becoming popular, is on the same lines exactly.

POODLE.—This is probably the cleverest of all dogs and most apt to learn tricks. Its colors are a deep black, blue, red, white, or cream. There are two varieties, the corded, which has a long, rope-like coat, and the curly, which should be short and tightly curled like a strakhan. They make ideal companions and can readily be broken to the gun and make grand retrievers.

FOX TERRIER.—The fox terrier is probably the most popular of all terriers. It is said to have descended from a cross between the small fox hound and the English terrier. It derives its name from the use of driving foxes from holes or burrows in the ground. The most popular color is a pure white body with black and tan markings on the head, with an even blaze up the face. The head should be flat and narrow, with a strong foreface or muzzle, eyes small, ears likewise small and of V shape, carried forward and close to the head. The body should be short, with well-sprung ribs, narrow in chest, with clean sloping shoulders, perfectly straight front and cat-like feet. The wire-haired dog is identically the same as his smooth brother, with the exception of the coat, which should be rough, with a decided harsh texture. Weight, 15 to 21 pounds.

IRISH TERRIER.—As the name implies, is of Irish origin and is aptly named the "Dare Devil," being very game. In size it is somewhat larger than the fox terrier, and more racy in body, and has larger feet. Cropping the ears has now gone out of fashion, the modern ear being the same as the fox terrier.

Standard.—Head long, rather narrow, punishing jaw, eyes small and dark, ears fairly small, not set on too high, legs straight and strong, feet round and thick, with good pads; chest narrow, with good depth of brisket, back strong and straight. Color, wheaten and red. Expression wicked but intelligent. Coat short and rough, and very harsh.

BOSTON TERRIER.—This smart little dog is especially of American origin having been raised in Boston and the nearby towns for the past 40 years. It resembles the bull-dog in head, but is void of wrinkle and must not show the teeth; the body should be built on the terrier type, having a narrow front, with strong, but not wide, shoulders, short back, and a short screw or tapering tail. The ears are cropped and carried erect. The three classes by weight are under 15 pounds, under 23 pounds, and not exceeding 32 pounds. Colors are brindle with white markings, fawn and white, or red and white. They are used entirely as pets.

Pugs.—This quaint breed is one of the most popular house pets. In appearance they resemble the bull-dog, having a short, square muzzle and heavily wrinkled head. The ears should hang close to the head and be carried forward; the body be short and round and the tail curled and lie on the back. The colors are a rich apricot fawn with black shadings and a deep black.

DOG-DAYS—DOG-TOOTH VIOLET

TOY SPANIEL.—The English toy spaniels are the King Charles, or black and tan, the Blenheim or orange and white, the Prince Charles, and the Red, and are practically all of the same family, distinguished only by the colors. The head should be large and domed, with the ears set very low in the skull; the nose, or face, as short as possible and stop well defined; eyes as large as possible and very prominent; body short and well coated, and small in size. They are essentially house pets.

JAPANESE SPANIEL.—It is black and white, or orange and white. The head is not so large or domed as the English spaniel and the ears are much smaller and carried higher and V-shaped; eyes wide apart and showing a good deal of the white; tail heavily coated and carried over the back. In size it is as small as possible.

CHARLES G. HOPTON,
Kennel Editor of 'Rider and Driver.'

Dog-days (Lat. *caniculæ*), the name applied by the ancients to a period of about 40 days, the hottest season of the year, at the time of the heliacal rising of Sirius, the dog-star; that is, the time when it rose just before the sun. The heat, which is usually most oppressive at this season, was formerly ascribed to the conjunction of this star with the sun. We still retain the expression dog-days, as applied to the hottest season of the year, but owing to the precession of the equinoxes it is no longer the time of the heliacal rising of the dog-star.

Dog-fish, the popular name of several species of small shark (q.v.), chiefly belonging to *Mustelus* and *Squalus*, two quite unlike genera. The name is derived from their habit of swimming in schools or packs in pursuit of their food. In their general anatomy, they differ but little from the other sharks, so well known for their ferocious and savage habits. The dog-fishes, though among the smallest of the tribe, manifest propensities equally cruel with those which have rendered the white shark and others so justly dreaded. Although seldom or never injurious to man, they commit great ravages in the fisheries, and where they abound constitute one of the greatest nuisances to the fishermen. Exceedingly voracious and devouring almost everything which they encounter, the mischief they occasion by taking the baits, and very often the hooks, of the deep-sea lines, is very considerable and not at all compensated for by the flesh of those which are captured.

The smooth dog-fish or dog-shark (*M. caninus*) is found on both sides of the North Atlantic, and on the American side is particularly abundant south of Cape Cod. It is about 2 to 3 feet long. No spines occur in the margins of the dorsal fins, and the smooth pavement-like teeth are especially adapted for crushing crabs, lobsters, and other testaceous invertebrates on which they chiefly feed. The young are hatched from the egg in the oviducts of the female (with which, however, they are not connected by a placenta, as in the related *Galeus mustelus* of Europe), and are born alive. The eggs are similar to others of the family, and covered by a tough membranaceous integument. The skin of these fish is beset with numerous small asperities, which render it, when dried, well adapted for polishing wood and for other mechanical purposes.

The spiny dog-fish (*Squalus acanthias*) is very abundant on the coasts of New England, and, although similar in size and general aspect, is readily distinguished from the smooth dog-fish by the presence of a strong spine before each of the two dorsal fins. The eggs are deposited before hatching. This species furnishes material for a valuable fishery and fish industry in Maine, where the oil is extracted from the livers, the flesh ground up for fertilizers or poultry food, and the skin utilized for polishing metal and wood. The dog-fish feeds chiefly on herring and mackerel, the schools of which it follows in immense numbers. Similar species occur in the Pacific Ocean and other seas.

The flesh of all the species is hard, dry, and unpalatable, requiring to be well soaked before it is eaten. In England the dried flesh goes under the name of Folkestone beef. Poisonous effects are at certain times observed in consequence of eating the livers of dog-fish, and some cases are recorded in which the most distressing illness has been occasioned by the practice. The name dog-fish is also applied to several other quite distinct fishes, more particularly to the western mud-fish or bow-fin (*Amia calva*), and to the dog-salmon (*Oncorhynchus keta*).

Dog-grass. See COUCH-GRASS.

Dog Parsley, one of the common names of *Æthusa cynopium*, a poisonous plant of the carrot family, the only species of the genus *Æthusa*, found in America, from Nova Scotia west to Minnesota, and south to New Jersey, having been naturalized from Europe. The fruit bears some resemblance to the fruit of dill and fennel, and is sometimes eaten in mistake for these. The sharp acrid taste marks the difference. Other names are: Fool's parsley, fool's cicely, and dog-poison.

Dog Rose (*Rosa canina*), a plant of the rose family (*Rosaceæ*); known also as the canker rose, wild brier, and referred to by Shakespeare as "canker-blooms." It is a native of Europe and northern Asia. The ripe fruit is sometimes used abroad to make a preserve that is employed in the manufacture of pills. The plant is naturalized in America, and is found along roadsides from Nova Scotia through western New Jersey and eastern Pennsylvania, and particularly abundant in the valley of the Delaware; it is also found in Tennessee.

Dog-salmon, a name given in Alaska to the *Oncorhynchus Gorbuscha*, more commonly known as the hump-backed salmon. This is a species of the widely extended Pacific salmon, which are found on the North American coasts from Alaska to as far south as Oregon or even the Sacramento River.

Dog-star (SIRIUS), the star that gives their name to the dog-days (q.v.). Sirius is the brightest star in the heavens, and once was thought to exercise a baleful influence upon human affairs. It is now a clear white star in the constellation Canis, though Seneca and Ptolemy describe it as red.

Dog-tooth Spar, a common variety of the mineral calcite (q.v.), so named because of the resemblance of the acute scalenohedrons, of which it is composed, to a dog's tooth.

Dog-tooth Violet, a common but erroneous name for plants of the genus *Erythronium* (q.v.).

Dogbane, the English name of the *Apocynaceæ*, a natural order of perennial herbs, shrubs, vines and, in some tropical genera, trees, nearly all possessing a milky acid juice. The order includes about 130 genera, and 1,050 species are recognized. They are widely distributed throughout the world, the larger number in the tropical regions. In America at least 4 genera, and 10 or more species are known. The typical genus *apocynum* is represented by the largest number, of which three are called dogbanes, the best-known being *A. cannabinum*, Indian hemp (q.v.). The spreading dogbane or honey-bloom (*A. androsaemifolium*), known also as bitter-root, is found in fields and thickets from Anticosti and British Columbia to Georgia, Nebraska, and Arizona. It belongs to the natural order *Apocynaceæ*, many of the plants of which are poisonous, and some of them drastic purgatives. The whole plant yields the acrid milky juice so common in members of the family; the root is intensely bitter and nauseous. It is the most powerful part, and is employed by country physicians instead of ipecacuanha.

Dogberry. See Dog-wood.

Doge, *dōj* (from the Latin *dux*, a leader or duke), formerly the title of the first magistrates in the Italian republics of Venice and Genoa. The first doge of Venice elected for life was Paolo Anafesto, in 697. The doge was first elected by the people, but afterward by the great council. He held his dignity for life. His power was at first almost absolute. He could convoke legislative assemblies, declare war, conclude treaties, take command of the army, appoint military officers and judges, invest bishops, and award ecclesiastical penalties. But this absolute authority became by degrees very limited. The dignity was abolished with the overthrow of the republic in 1797. In rank he was considered only equal to a duke, though the republic of Venice was in dignity equal to a kingdom. In Genoa the office of doge was established in 1339. Here also the doge was at first elected by the people, but the dignity afterward experienced numerous changes both in this and other respects. After the liberation of Genoa from the yoke of France by Andrea Doria the power belonging to this office was more systematically defined. A great and small council were created, and the duration of the office was limited to two years. After the overthrow of Genoa by the French in 1797 the dignity became extinct, although it was revived for a short time between 1802 and 1805. See GENOA; VENICE.

Doge's Palace, *The* (It. *Palazzo Ducale*), the official residence of the former rulers of Venice, begun in 1350 and finished in 1442. Its variegated walls of marble and its colonnades make it one of the most striking sights of the city. It is famous for its carvings and paintings. The halls of the interior are adorned with works by Titian, Tintoret, Veronese, and other Venetian masters.

Dogger, *dōg'gēr* (from Dutch "dogger," a codfish), a Dutch vessel equipped with two masts, and somewhat resembling a ketch. It is principally used for fishing in the North Sea, chiefly on the Doggerbank.

Doggerbank, an extensive sand-bank of the North Sea, between England and Denmark. It is celebrated for its cod fishery.

Doggett's Coat and Badge, a prize for a rowing-match on the Thames, which takes place every year on 1 August, the course extending from London Bridge to Cadogan Pier, Chelsea. The first prize is an orange-colored waterman's coat and a silver badge representing the white horse of Hanover, and to this have been added other prizes, the first prize being also augmented. The match is open to six young watermen recently out of their apprenticeship. It was instituted by Thomas Doggett, a native of Dublin, and a popular actor in the early part of the 18th century, who left a bequest for the purpose of founding the prize in commemoration of the accession of George I. (1 Aug. 1715). Dibdin's ballad opera, 'The Waterman,' is based upon this rowing contest.

Dogma, in the theological sense of the word, is a tenet of faith given in the word of God whether written or traditional and proposed by the Church to the belief of the faithful. Primarily the term dogma, being derived from the Greek verb *δοκεω*, to seem, to appear, meant only opinion; but in the ancient schools of philosophy dogmata (plural) were the doctrines of the several heads of such schools. The disciples of Pythagoras accepted on the authority of The Master, as they styled him emphatically, the tenets he proposed, the sufficient ground of the disciples' belief being that *αὐτος ἐφη* "He said it." Perhaps the first employment of dogma, dogmata in the now current meaning of the word, is found in a work by St. Ignatius, disciple of St. John the Evangelist, who in an epistle to the Magnesians exhorts them to be "established in the dogmata of the Lord and the apostles." The dogmas of the Roman Catholic Church purport to have been taught by the apostles and to have been by them handed down *viva voce* or in writing, to their contemporaries and successors, who in turn did and still do the like: that tradition is the foundation of all the Church's articles of belief. The Church has no power to frame new dogmas, and she must to the end of time proclaim the self-same dogmas which at any time in her history were authentically set forth as truths of divine revelation. What the Church may do and has done is to define, as occasion may require, the precise meaning of her teachings, bringing out into definite shape what before was not expressed with all necessary fulness or clearness. An example of this is had in the application of the term transubstantiation to signify what the Catholic Church had at all times believed and taught—that the bread and wine are, in the sacrament of the Eucharist, really and substantially changed into Christ's body and blood.

Dogmatics, a systematic arrangement of the articles of Christian faith (dogmas), or the branch of theology that deals with them. The first attempt to furnish a complete and coherent system of Christian dogmas was made by Origen in the 3rd century, who was followed by St. Augustine in the 4th century. Among Protestants, Melancthon was the first who wrote a compendium of the Christian doctrine.

Dog's-fennel, a plant (*Anthenus coluta*) belonging to the natural order *Compositæ*, and *camomile* genus. It is found in fields and waste places throughout North America, except in the Arctic regions, having been naturalized from Europe. It is known as a weed in Asia, Africa,

DOGS — DOLBEAR

and Australia. It derives its name of dog's-fennel from the resemblance of its leaf to fennel, and from its bad smell. It has an acrid taste and emetic properties. This plant is also called "stinking May-weed," the scentless May-weed, or wild camomile (*Matricaria inodora*). The name dog's-fennel is sometimes applied in America to a species of the genus *Eupatorium*, hog-weed.

Dogs, Isle of, a peninsula of London extending into the Thames opposite Greenwich. The Millwall docks are on this peninsula. The king's hounds were formerly kept here, hence the name.

Dog's-tail Grass, so called from the resemblance of the spike to a dog's tail. (Lat. *Cynosurus*), a genus of four or five annual and perennial grasses, with flat leaves, native to the north temperate regions of the Old World. One of these grasses has been introduced into this country and is sparingly established. Crested dog's-tail (*Cynosurus cristatus*) is a slender, erect perennial growing from one to two and a half feet high, with narrow leaves and a rather slender, erect, spike-like panicle. It is valuable for lawns, constituting a large proportion of the sward of some of the best bowling greens of England. Its close, compact sod makes it an excellent pasture grass, especially for sheep. Its nutritive value is high, but its yield is low, and its tendency to seed itself in districts where it will grow, to the exclusion of more profitable grasses, and the objection of animals to its wiry flower-stalks, together with the high price of seed, will no doubt restrict its usage by American farmers. It will grow on thin soils, in a humid climate, but prefers a rich moist soil. It grows well in the shade and flowers from June to August. The seeds are small, shining and yellow, and impurities are readily recognized. The mature flower-stalks are valuable, being used in the manufacture of Leghorn hats.

Dog's Tongue, a biennial plant, *Cynoglossum officinale*, belonging to the *Boraginaceæ*, Borage family. It grows on waste ground and pastures.

Dogtooth, in architecture, an ornamented molding used in early mediæval times in the form of a four-leaved flower, with teeth projecting in the centre; also a steel punch used in working marble.

Dogwatch, on shipboard, a name given to each of two watches of two hours each instead of four, adopted for the purpose of varying the hours of watches kept by each part of the crew during the 24 hours. The watches are arranged thus: 8 to 12 P.M.; 12 to 4 A.M.; 4 to 8 A.M.; 8 to 12 A.M.; 12 to 4 P.M.; 4 to 6 P.M., dogwatch; 6 to 8 P.M., dogwatch; 8 to 12 P.M., and so on.

Dogwood, the common name of the *Cornaceæ*, a natural order of plants, either shrubs or trees, with three or more entire leaves at a node, and polygamous or dioecious flowers in cymes, but sometimes solitary. The fruit is a drupe. The family numbers about 16 genera, and 85 species, most numerous in the northern hemisphere. Of the genera, two are found in America. *Cornus*, the typical genus of the order, has 25 species natives of the northern temperate zone, Mexico, and parts of Peru, 18 of which are found in America. To this genus

belong the American shrubs and trees, known as cornel (q.v.), dogwood and kinnikinnik. The other American genus is *nyssa* (q.v.), which includes the trees called pepperidge, sour-gum, and tupelo. The wood of *C. florida* is smooth, white and fine-grained, and is used for inlaying, and from the bark a febrifuge is made. The southerners who "dip" snuff, use the small branches of the tree to make the brush with which the snuff is applied. The common dogwood of Europe (*C. sanguinea*) is a shrub of remarkable beauty in autumn owing to the deep redness of its foliage. The wood makes the very best charcoal for gunpowder. It is very hard, and is made into skewers, cogs for wheels, etc., and in former times it was in request for making arrows. The small bitter fruit yields as much as one third of its weight of an oil resembling that of olive. The wood of *Rhamnus frangula*, the berry-bearing alder, is also used by gunpowder-makers, and called by them dogwood. Jamaica dogwood (*Piscidia erythrina*) is a papilionaceous timber-tree; the cortex of the root is powerfully narcotic, used for stupefying fish or deadening the pain of toothache.

Dohnanyi, dō-nōn'yē, Ernst von, Hungarian composer: b. Presburg 1877. While a pupil at the Royal Conservatory at Budapest 1894-7 he took several prizes for composition. In 1897 he studied with D'Albert to perfect himself in the technique of the pianoforte previous to touring the chief cities of Austria, Germany, and England. His tours of America in 1900 were successful. His pianoforte concerto in C minor took the Rosendorf prize, Vienna, March 1899. This he played with the Boston Symphony Orchestra.

Dohrn, dōrn, Anton, German zoologist: b. Stettin 29 Dec. 1849. He studied at Königsberg, Bonn, Jena, and Berlin, lectured for a time on zoology at Jena, and in 1870 he founded the great zoological station at Naples. As an embryologist he has devoted himself mainly to the development of insects and crustaceans; and besides reports, he has published works on the origin of the vertebrates.

Doit, a small copper coin anciently current in Scotland, and equal in value to one twelfth (according to others, one eighth) of a penny sterling. There was also in lower Germany a small coin called *deut*. In the Netherlands the coin is called *duyt*.

Dolabella, dōl-a-bēl'ā, Pub'lius Cornel'ius, Roman leader: b. about 70 B.C.; d. 43 B.C. He married Cicero's daughter Tullia, but treated her so harshly that she was ultimately obliged to leave him. He possessed considerable talents, and at one time stood high in the opinion of Cicero, though there is reason to suppose that Cicero valued him chiefly for the assistance he expected him to give against Cæsar and his party. When disappointed in this expectation his eyes were opened, and he spoke of him with the utmost bitterness and contempt. Dolabella, when about to fall into the hands of his enemies, was slain at his own request by one of his soldiers.

Dolabra, dō-lā'brā, the Latin name for a Celt. See CELTS.

Dolbear, Amos Emerson, American educator and inventor: b. Norwich, Conn., 10 Nov. 1837. He was graduated at Ohio Wesleyan

University in 1866 and has been professor of physics and astronomy in Tufts College since 1874. He has achieved eminence in scientific research, and among his numerous inventions are the writing telegraph (1864), the electric gyroscope (1867), the magnetic telephone (1876), the static telephone (1879), and the air-space telegraph cable (1882). Among his discoveries are the convertibility of sound into electricity (1873), wireless telegraphy (1881), and electric photography (1893). He has received several medals, including a bronze medal for an acoustic apparatus at the Centennial Exposition, Philadelphia, 1876, a silver medal in Paris 1881, and a gold medal in London 1882. Among his published works are: 'Chemical Tables'; 'The Art of Projecting'; 'The Speaking Telephone'; 'Matter, Ether, and Motion'; 'Modes of Motion'; and 'Natural Philosophy.'

Dolce, dōl' or dōl'chā, or **Dolcemen'te**, in music, an instruction to the performer that the music is to be executed softly and sweetly.

Dolci, dōl'chē, **Carlo** or **Carlino**, kār-lē' nō, Florentine painter: b. Florence 25 May 1616; d. there 17 Jan. 1686. His works, which consist chiefly of madonnas and saints, exhibit the character attributed to him. The faces are full of a pleasing and tender softness, which, however, is often carried so far as to rob them of all character. Dolci's drawing is generally correct, his coloring exquisitely delicate and transparent, and in the nicety and laborious care of his finish he approaches the most characteristic examples of the Dutch school. His works are numerous and scattered over all Europe. Besides his madonnas his most famous works are his 'St. Cecilia'; 'Christ Blessing the Bread and Wine'; and 'Herodias With the Head of John the Baptist.'

Dol'cinites (from Dolcino, their founder), a Christian sect which arose in Piedmont in 1304. See APOSTOLIC BRETHERN.

Dol'drums, a nautical term for the parts of the ocean near the equator that abound in calms, squalls, and light baffling winds; otherwise known as the horse-latitudes; also applied to the weather variations characteristic of those regions. See CALMS, REGION OF.

Dole, **Charles Fletcher**, American Unitarian clergyman: b. Brewer, Me., 17 May 1845. He is a brother of N. H. Dole (q.v.). He has been pastor of the Unitarian Church, Jamaica Plains, Boston, from 1876. He is the author of 'The Citizen and the Neighbor'; 'Jesus and the Men About Him' (1888); 'A Catechism of Liberal Faith' (1895); 'The American Citizen' (1891); 'The Coming People' (1897); 'Noble Womanhood' (1900), etc.

Dole, **Nathan Haskell**, American writer: b. Chelsea, Mass., 31 Aug. 1852. He was graduated from Harvard 1874, and was literary and musical editor of the *Philadelphia Press* until 1887, when he became literary adviser to the publishing firm of T. Y. Crowell & Company. His principal original works are: 'Young Folks' History of Russia' (1881); 'A Score of Famous Composers'; 'Not Angels Quite'; 'On the Point' (1894); 'The Hawthorn Tree' (1895); 'The Mistakes We Make' (1898); and 'Omar, the Tent-Maker' (1898). In 1899 he edited the complete works of Count Tolstoi, whose novels, 'Anna Karenina,' 'War and Peace,' and many others he had already translated. He has also

translated 'Maria y Maria,' 'Maximina,' and 'Sister St. Sulpice,' from the Spanish of Valdes, as well as various works from the French and German. In 1896 he edited a multivarium edition of the 'Rubaiyat of Omar Khayyam,' containing many translations in English, French, German, Italian, Hungarian, and Danish carefully collated.

Dole, **Sanford Ballard**, Hawaiian politician: b. Honolulu, Hawaii, 23 April 1844. He studied law in Boston and was admitted to the bar in 1873, returning in the same year to Hawaii. In 1884 he was made a member of the legislature and again in 1889. He had been, in 1887, appointed an associate judge of the supreme court, under the monarchy, which post he resigned to accept the leadership of the revolution that overturned the monarchy in January, 1893, and established a provisional government. On 4 July 1893 a republic was formally proclaimed, of which he was elected president. After the annexation of Hawaii in 1898 he was appointed governor of the islands.

Dôle, dōl, France, town in the department of Jura, 26 miles southeast of Dijon. The manufactures are Prussian blue, hosiery, ironware, leather, vinegar, optical instruments, etc.; and the trade is chiefly in grain, flour, timber, wine, brandy, coal, iron, mill-stones, and marble. It possesses many ruins of Roman architecture. Pop. 12,750.

Dolerite, dōl'ēr īt, the name given to a class of rocks, including dolerite proper, basalt, and a few others. Dolerite itself consists of Labrador felspar and augite, with some titaniferous magnetic iron ore, and other minerals. It has a dark-gray color, crystalline, and small-grained, sometimes porphyroidal. Its specific gravity is 3. Its average composition is silica 50, alumina 15, oxide of iron 15, lime 10, magnesia 5, and the rest potash, soda, and water. It is found in great mountain masses, in beds and veins, in the Rhine district, in Iceland, in Guadeloupe, and other places.

Dolet, dō'lā'', **Etienne**, a well-known French scholar and martyr: b. Orleans, France, 1509; d. Paris 3 Aug. 1546. At the age of 12 Dolet went to the University of Paris, where his attention was directed to the study which became the chief interest of his life—the writings of Cicero. In 1544, he was found guilty of heresy on a charge mainly based on an alleged mistranslation of Plato, in which he was accused of denying the immortality of the soul. After two years' imprisonment, Dolet was burned in the Palace Maubert, Paris. See Boulmier, 'Etudes sur le XVIème siècle: Etienne Dolet' (1875); Christie, 'Etienne Dolet, the Martyr of the Renaissance' (1899).

Dolgoruky, dōl'gō-roo'kē, **Katharina Michailow'na**, Princess, the favorite of the Czar, Alexander II., who married her in July 1880 after the death of his first wife, Marie. After the czar's death she lived abroad, and published in Geneva in 1882, under the pseudonym of VICTOR LAFERTÉ, 'Alexander II., Unedited Details of His Private Life and His Death.'

Dolichocephalic, dōl'ī-kō-se-fāl'īk (from Gr. *δολιχός* long, *κεφαλή* a head); long-headed: a term used in ethnology to denote those skulls in which the diameter from side to side is

DOLICHOPODIDÆ — DOLLART

less in proportion to the longitudinal diameter (that is, from front to back) than 8 to 10. This form of skull is seen in an exaggerated form in native Australians and West Africans. The dolichocephalic skull of ordinary type appears among Indo-European races.

Dolichopodidæ, *dol'ī-kō-pōd'ī-dē*, a numerous family of the order *Diptera*. They are small, metallic blue or green flies with slender legs and active habits. The larvæ live in the ground or in decomposing matter. They are not known to be harmful, but the flies are predaceous, and by this habit are beneficial to agriculture, catching, as they do, insects, and even worms, that are injurious to growing crops.

Dolichos (Gr. *δολυχός* long, that is, in pods), a genus of tropical herbs and shrubby plants of the natural order *Leguminosæ*. The 40 or 50 species, of which few are cultivated, are separated from species of the related genus *Phaseolus* by technical characters. The best known species are *D. lablab*, the hyacinth bean, a native of the tropics. It often twines around supports to a height of 20 feet, bears broad, often wrinkled leaves, purple, rather large flowers in erect, axillary racemes, and flat, rather smooth pods containing several small, black seeds. It is an annual, frequently planted in sunny situations to form temporary screens and arbor covers. It succeeds well in any good garden soil, but attains the greatest growth and bears the most foliage upon rich soils. It has several horticultural varieties. *D. sesquipedalis*, the French half-a-yard-long or asparagus bean, a native of South America, is cultivated for its green pods and mature seeds, which are used as esculents. The plant is an annual, twining or rambling plant, with rather large leaves and flowers and very long pods containing numerous small, oblong, usually reddish seeds. The pods sometimes exceed two feet in length and are sometimes curiously twisted. Several other species are used in Asia for food, but the two mentioned are the only ones of importance in the United States. See **SOY BEAN**.

Doll, a favorite plaything of children, found in variety of form and decoration. Most of the dolls found in the stores are made in the village of Sonneberg, in the Thuringian forest, Germany. Here the industry of making children's toys can be traced back to the 17th century. Other villages in this vicinity and some towns in France and Switzerland also export large quantities of dolls to England and the United States. There are about 40 doll manufacturers in London who make dolls of a superior kind. In France expensive life-size dolls are manufactured. There are a number of doll factories in the United States, where of late years "doll shows," or bazaars, have been very popular. The phonograph doll, invented by Edison, created great interest when it was first introduced.

Dollar (Low German *daler*, from *thaler*, short for *Joachimsthaler*, coined 1519 from silver mines in Joachimsthal, Bohemia, and standard for weight and purity), the unit of American currency. The West India trade before the Revolution had made the Spanish dollar, more convenient than the sovereign, the real unit of trade here; and the Coinage Act of 2 April 1792, merely legalized this fact, establishing the dollar

as the unit of American currency, making it equivalent to 24.75 grains of fine gold, and authorizing the coinage of silver dollars "of the value of a Spanish milled dollar the same as is now current" (see also **CENT**), and of halves and quarters correspondent. The first actual coinage was in 1794, dollars of 416 gr., 371.25 silver, 8924 fine. The dollar of account was rated at 4s. 6d. sterling, making the pound equal to \$4.44; which, as the sovereign was 113 gr. gold, was too little, and should have been \$4.565. By act of 28 June 1834, the gold in the dollar was reduced to 23.20 gr., raised 18 Jan. 1837, to 23.22, where it remains, the pound having been unchanged, has since been equal to \$4.8633. The last act made the weight of the silver dollar 412.5 gr., but raised it to 900 fine, the amount of silver remaining the same as before, 371.25 gr. On 3 March 1849, a coinage of gold dollars was authorized, weight 25.8 gr., .900 fine, 23.22 gr. pure gold; on 21 Feb. 1853, a \$3 gold piece, same fineness, 77.4 gr.; and half and quarter dollars of silver, 192 and 96 gr. respectively, but legal tender only to \$5. The act of 1873 discontinued the coinage of the silver dollar of 412.5 gr., but authorized one of 420 gr. (the "trade dollar") for the China and Japan trade. The fall in silver shortly after, however, (at this time the silver dollar was worth rather more than the gold), inflated its value and made bullion owners anxious to have their metal coined into these, and on 22 July 1876, their coinage was limited to the actual demand for export, they not being intended for internal circulation—35,959,360 were issued in all. The coinage was suspended April 1878. The act of 28 Feb. 1878, revived the coinage of the dollar of 412½ gr., and that of 14 July 1890, continued it. It is notable that many times more silver dollars have been coined since 1873 than before; up to 30 June 1872, the total number struck was only 8,045,838, while that of gold dollars was 19,015,642. The act of 14 March 1900 makes the gold dollar the standard of value in the United States.

Dollar-fish, a name used, particularly in Maine, for a small fish of the family *Stromateidæ*, more widely known as the butter fish or harvest fish (*Rhombus triacanthus*). It is found on the entire extent of the Atlantic coast of the United States, and is extremely abundant during the summer on the shores of the New England and Middle States. The dollar-fish is from 8 to 10 inches long, of an oval form, with a blunt snout and small mouth; the color is silvery, bluish above, beautifully iridescent when alive. Great numbers are captured in seines and pound nets and they are highly valued as pan-fish. The young have an interesting habit of swimming, several together, in the company of large jellyfishes, beneath the disks of which they seek shelter and protection. Several allied species occur on both the east and west coasts of the United States.

Dollart, *dōl'lért*, **The**, a gulf of the North Sea, at the mouth of the Ems, between the Dutch province of Groningen and the Prussian province of Hanover. It was formed by inundations of the sea, which took place in 1277 and subsequently, overwhelming many large villages and hamlets, and destroying thousands of human beings, besides much valuable property. A

considerable extent of rich land has been regained by embankment.

Döllinger, dël'ling-ër, John Joseph Ignatius, German theologian and historian: b. Bamberg, Bavaria, 28 Feb. 1799; d. 12 Jan. 1890. He studied at Würzburg, took priest's orders in the Roman Catholic Church in 1822; taught for several years in the Luceum at Aschaffenburg, and in 1826 was appointed professor of ecclesiastical history and law in the University of Munich. He held this position until 1871, when he was elected rector of the university. His connection with politics began in 1845, when he represented his university in the Bavarian chamber, and in 1848 he was elected to the Frankfort parliament by a Bavarian constituency. In the early part of his career Döllinger was the zealous leader of the Ultramontane party in Germany, and his learning as well as his faith found expression in his 'Treatise on the History of the Church' (1838); 'The Reformation, its Interior Development and its Effects' (1846-8); and 'Luther' (1851). In 1857 he visited Rome, and soon afterward it became evident that his views had undergone a change. Public announcement of this was made in a course of lectures which he delivered at Munich, in which he declared the temporal power of the Pope not an essential part of the Roman Catholic Church, and he expounded this position in a treatise on 'The Church and the Churches' (1861). This attitude of opposition became more pronounced in 1870, when he declined to accept the doctrine of papal infallibility formulated by the Vatican Council, and assumed the leadership of the Old Catholic party. As a result Döllinger was excommunicated by the Archbishop of Munich, but still retained the support of the Bavarian government. In 1874 he presided over a conference of Old Catholics at Bonn, and here he declared that he did not hold himself bound by the decisions of the Council of Trent. In his latter years Döllinger's activity as an author was shown in his 'Materials for a Life of Bellarmine' (1887), and two volumes of 'University Lectures' (1888-9). See Kobell, 'Ignaz von Döllinger, Erinnerung' (1891); 'Life,' by Friedrich (1899-1901). See OLD CATHOLICS.

Dolliver, Jonathan Perkins, American lawyer and politician: b. near Kingwood, Preston County, W. Va., 6 Feb. 1858. He was graduated at West Virginia University 1875 and admitted to the bar 1878. He practised law in Iowa and was a member of Congress from that State for several successive terms. He was appointed United States senator to fill a vacancy and was elected in 1903 for the term ending 1909.

Dollman, John Charles, English artist: b. Hove, 6 May 1851. He was educated in the Royal Academy Art Schools and received a bronze medal at the Paris Exhibition in 1900. Among his works may be named: 'Not Worth Powder and Shot'; 'Warranted Quiet to Ride or Drive'; 'Judas'; 'Gold'; 'Temptation of St. Anthony'; 'Kismet.'

Dollond, John, English optician of French descent: b. London 10 June 1706; d. there 30 Nov. 1761. He devoted his attention to the improvement of refracting telescopes, and succeeded in constructing object-glasses in which the refrangibility of the rays of light was corrected. Subsequent members of his family have

distinguished themselves in optics, astronomy, etc.

Doll's House, The, one of the best known plays of Henrik Ibsen, published in 1879. It pictures woman as a doll, from whom nature has removed the unused faculties which produce clear thinking and business-like action. Nora, the doll in question, is sweet, childish, ignorant. For the sake of her husband she forges her rich father's name without realizing her guilt. Disclosure of her act brings her face to face with the realities of life, and she leaves her husband's house. An English version of the play was produced in London in 1889.

Dolly Varden, the soft-hearted, wily little coquette in Dickens' novel 'Barnaby Rudge.' The impression made by the author's description of her dress of flower-sprinkled dimity led to the adoption of a style of dress that is known as the Dolly Varden. The name is often applied to any light dress-goods with bright-colored flower effects.

Dolly Varden Trout, the common brook trout (*Salvelinus malma*), of western North America, so called because of the beauty of its markings, which are said to resemble the coloring of a Dolly Varden (q.v.) dress. The trout often attains a weight of 12 pounds. In the region of its native waters it is known as the bull-trout, red-spotted trout, and malma. It has been used to stock streams in the northeastern States, Canada, and Europe.

Dol'man, a long robe worn by the Turks as an upper garment. It is open in front, and has narrow sleeves buttoned at the wrist. It has given its name to a kind of loose jacket worn by women as an outer garment. It has a cape or hanging piece over the arm instead of a sleeve.

Dol'men, a structure consisting of one large unhewn stone, resting on two or more unhewn stones, placed erect in the earth. The name is sometimes used as equivalent to cromlech, sometimes in a distinctive sense. Sir John Lubbock maintains that cromlech should be applied to a stone circle, dolmen to a stone chamber, such circle or chamber consisting of huge stones set up often in prehistoric times for religious or sepulchral purposes or as memorials of some important event.

Dolnja Tuzla, döl'nyä tooz'tä, Bosnia, town about 20 miles from the Servian frontier. Pop. 10,227.

Dolomieu, Déodat Guy Silvain Tancrède Gratet de, dā-ō-dā gē sil-vān tăn krād grā-tā dē do-lo-mē-ē, French geologist and mineralogist: b. Dolomieu (Isère) 24 June 1750; d. Chateaufort, France, 26 Nov. 1801. He was appointed correspondent of the Academy of Sciences of Paris, and from 1777 to 1791 made extensive travels in the south of Europe, often on foot, with a hammer in his hand and a bag on his back. In 1796 he was appointed professor or lecturer in the School of Mines, and on the establishment of the Institute was made a member of that society. In 1801 he received the professorship of mineralogy in the museum of natural history. Among the works left by him are 'Voyages aux Iles de Lipari' (1783); 'Sur le Tremblement de Terre de la Calabre' (1784); 'Philosophie Minéralogique' (1802).

DOLOMITE—DOMAIN

Dolomite, carbonate of calcium and magnesium (Ca,MgCO_3) containing normally 30.4 parts lime and 21.7 parts magnesia, but varying in the ratio of the two carbonates. Iron and manganese carbonates are sometimes present as impurities. The crystallization is rhombohedral; the hardness 3.5 to 4; specific gravity 2.8. The color is normally white but may be reddish, grayish, brownish, or even black. In general the mineral resembles calcite but differs in not effervescing freely with cold acid, even if finely powdered. Massive dolomite in the form of dolomitic limestone is a rock of common occurrence and sometimes forms strata of great extent and thickness. Such limestones frequently show all transitions from nearly pure calcite to true dolomite. Generally, a limestone containing over 5 per cent MgO is described as a magnesian limestone. Under pressure dolomitic limestones and dolomites become crystalline and are classified as marbles. Many of the great limestone formations in the United States are more or less dolomitic. See **DOLOMITIZATION**; **LIMESTONE**; **ROCKS**.

Dolomite Mountains, or **Dolomite Alps**, a group of mountains, part in Tyrol and part in Italy. The name comes from the mineral dolomite, found in large quantities in these mountains.

Dolomitization, the process by which the calcium in limestones is replaced by magnesium, forming dolomitic limestones and dolomites. The exact nature of this process is still a matter of doubt. Dolomites cannot be formed directly from the calcareous remains of animals, since they contain a much larger proportion of magnesia than any animal shells or tests, and the magnesium therefore was probably added after the calcareous material had accumulated. In the lagoons of coral reefs, the enclosed body of sea water becomes concentrated by evaporation, and the chloride of magnesium (present in all sea water) by a process of double decomposition forms magnesium carbonate from the calcium carbonate of the coral rocks. It is also possible that fine calcareous mud in suspension in sea water may exchange some of its calcium directly for magnesium. See **DOLOMITE**.

Dolores, dō-lō'rēs, **El Grito de**, literally, "The cry, or outcry, of Dolores," marking the commencement of the Mexican war for independence. On the night of 16 Sept. 1810, Don Miguel Hidalgo y Costilla, the parish priest of the town of Dolores (q.v.), gathered a number of patriots under his banner to the cry of: "Long live religion! Long live our Most Holy Mother of Guadalupe! Long live America, and death to bad government!" All previous attempts (1798-1810) to rebel against the Spanish authorities had been suppressed; but Hidalgo and his enthusiastic followers were victorious in several engagements. Although he and his lieutenants, Allende, Aldama, and Jimenez, were captured and put to death in 1811, the movement they began was carried on until the revolutionists triumphed, 27 Sept. 1821, Yturbe entering the capital on that day. See **MEXICO**.

Dolores Hidalgo, ã-dāl'gō, Mexico, a town in the state of Guanajuato, department of Allende, about 41 miles from the capital of the state, which is also called Guanajuato. Pop. 6,000.

Dolph, John Henry, American painter: b. Fort Ann, N. Y., 18 April 1835; d. New York, 28 Sept. 1903. He studied at Antwerp, and in Paris, then opened a studio in New York; he was a member of the National Academy. His works include: 'Knickerbocker Farm Yard'; 'Season of Plenty'; 'Horse Doctor'; 'A June Day'; 'Who Will Bell the Cat'; 'Cat and Kittens'; 'A Princess'; 'Fish Commissioners'; 'Alexander and Diogenes'; 'The Waste Basket'; 'A Society Lion'; and 'Called to Order.' His pictures of animals, and particularly cats, are best known.

Dolph, Joseph Norton, American statesman: b. Dolphsburg, N. Y., 19 Oct. 1835; d. Portland, Ore., 10 March 1897. He studied law, and began practice at Binghamton, N. Y. In 1862 he settled in Portland, Ore., taking up the practice of law there. In 1864 he was elected city attorney, and was appointed United States district attorney. He was a member of the State Senate four consecutive terms, was elected to the United States Senate in 1883, and re-elected in 1889. In his second term he was chairman of the Committee on Coast Defenses, a member of the Committee on Commerce, and an active opponent of the free coinage of silver.

Dolphin, a group of cetaceans belonging to the family *Delphinidae*. The common species (*Delphinus delphis*) is found chiefly in the Mediterranean and North Atlantic Ocean. It is from six to eight feet long; the body tapers toward the crescent-shaped tail, which is about a foot broad. The blow-hole is also crescent-shaped; and the beak is usually about six inches long. The dolphin is blackish on the back, and white below, the sides being gray. The female produces but one at a time, and devotes herself assiduously to caring for it. There are numerous species of dolphin, each confined, apparently, to a comparatively narrow range. All are voracious, and feed on other fish and various marine animals, eating, it is said, even the disabled and feeble of their own kind. They live in herds or "schools," and may be seen by ocean voyagers playing about the vessels. They will leap in graceful curves, into the air, make sudden descents into and through the waves, followed by a track of foam. Then they will re-appear, show their slender back-fins, expose their broad tails as they plunge below the water; and almost before one has missed them, they will rise on the other side of the ship. They are a source of pleasure to the ocean traveler; and furnish more substantial gratification to the sailors, who eat their flesh with much relish after their usual rations of salt-pork. The grampus, the porpoise, and many of the so-called whales, such as the white-whale, the killer-whale, and others, are related genera; as are also the soosoo of the Ganges, and the boto of the Amazon, which inhabit fresh water instead of the ocean. Consult Beddard, 'A Book of Whales' (1900).

Domain, from the Latin *dominium*, right of ownership, property, dominion. The territory over which dominion is exercised; the territory ruled over by a sovereign, or under the government of a commonwealth, as the domains of Great Britain. The term public domain is used in Europe, as property belonging directly to and controlled by the state; such as lands

DOMBEY AND SON — DOMESTIC SCIENCE IN SCHOOLS

set apart for state or public uses, roads, canals, parks, etc. In the United States the lands owned by the Federal government or by a State.

Dom'bey and Son, a novel by Charles Dickens, published in 1848. It represents a man of proud and unbending nature who centres his worldly ambitions in an only son, but who becomes broken and subdued by his child's death, family disgrace, and financial ruin.

Domboc, dōm'bōk, or **Doom-book** (A. S. "book of dooms or sentences"), the code of laws compiled by King Alfred, who made few if any original laws, but contented himself with restoring, renovating, and improving those which he found already in existence. Alfred's religious character is strongly impressed on his code, which begins with extracts from the Bible. Then follow the Ten Commandments, the part of the Mosaic law relating to criminal offenses, and passages from the New Testament, including the Golden Rule. The code was ratified by the Witan, as Alfred expressly informs us. Thorpe gives it in his "Diplomatarium Anglicanum ævi Saxonici" ('English Diplomatarium of the Saxon Era') (1865).

Dombrowski, Jan Henryk, yān hēn'rik dōm-brōf'skē, Polish general: b. Pierszowice near Cracow, 29 Aug. 1755; d. Wina-Gora, Prussia, 6 June 1818. After serving under the Elector of Saxony he returned to take part in the Polish campaigns against Russia and Prussia in 1792-4. Next entering the French service, he organized a Polish legion at Milan; and in the campaigns which followed, Dombrowski and his Poles took a distinguished part. After the fall of Napoleon he returned to Poland and was appointed by the Emperor Alexander a general of cavalry and Polish senator.

Dome. See CUPOLA.

Dome of the Rock, a name given to the Mosque of Omar, Jerusalem. It stands on Mount Moriah, on the site once occupied by the Temple of Solomon. Immediately under its dome is an irregular-shaped rock. This rock was the scene of many scriptural events, and has been greatly revered for ages. See JERUSALEM.

Domenichino, dō'mā-nē-kē'nō, or **Domenico Zampieri**, Italian painter: b. Bologna 28 Oct. 1581; d. Naples 15 April 1641. He was sent to study first with Calvart, and afterward with the Carracci. From the slowness of his execution he was named, by his fellow-students, the "ox of painting"; but Annibal Carracci predicted that the ox would "plough a fruitful field." Having contracted a great friendship for Albano he joined him at Rome, and his former master, Annibal Carracci, jealous of Guido, procured for him the execution of one of the pictures for a Roman Catholic church which had been promised to that great painter. It was a custom with Domenichino to assume, for a time, the passion he was depicting; so that, while working by himself, he was often heard to laugh, weep, and talk aloud, in a manner that would have induced a stranger to suppose him a lunatic. The consequence, however, was, that few painters have surpassed him in lively representation. His 'Communion of St. Jerome' has been considered, by some connoisseurs, inferior only to the 'Transfiguration' of Raphael; and the 'History of Apollo,' which he painted

in 10 frescoes for Cardinal Aldobrandini, is also much admired. His merit excited so much envy that he retired to his native city and employed himself two years on his famous picture of the 'Rosary.' He was afterward recalled to Rome (1621) by Gregory XV., who created him his first painter and architect of the Vatican. Losing this post after the Pope's death, he accepted an invitation to Naples, to paint the chapel of St. Januarius. But here he encountered a jealousy so rancorous that his life became altogether embittered by it; and so great was his dread of poison, that he prepared all his eatables with his own hand. Domenichino, who understood every branch of his art, produced nothing excellent without study and labor; but in consequence of his great premeditation, no painter has given his pieces more of the properties belonging to the subject. At the same time his designs are correct; and he succeeded equally in the grand and the tender. Nearly 50 of his pieces have been engraved.

Domestic Animals. See DOMESTICATION.

Domestic Science in Schools, the branch of study that is concerned with household economics as a part of the school curriculum. The introduction of manual training into American public schools naturally led to the development of sewing and cooking as branches of study for girls, and courses of this kind have been established in the grammar schools and high schools of many of the large cities throughout the country. In many cities there are manual training high schools with domestic science as a strong feature. The manual training high school of Kansas City offers domestic art as an elective, and was able in 1902-3 to accommodate 650 girls in one-, two-, and three-year classes. Downer College, Milwaukee; the State College of Agriculture, Ames, Iowa; the Minnesota State Agricultural College; the State Normal School at New Paltz, N. Y.; are only a few of the many institutions where a thorough training is offered. In New York the following institutions are teaching domestic science in all or part of its phases: Teachers' College; the Manhattan Trade School for Girls; the Girls' Technical High School; Pratt Institute, Brooklyn; the Hebrew Technical School for Girls; and the evening public schools of Manhattan, Brooklyn, and Queens.

A normal course in domestic science covers three years. The work of the first year includes psychology, history of education, chemistry, physiology, drawing, cord-work, weaving, basketry, sewing, cooking, and physical training. At the end of the first year the student is able to decide whether she is best qualified to teach domestic science or domestic art. If the latter specialty is preferred she takes advanced sewing, dressmaking, millinery, drawing, water color, design, history of costume, embroidery, normal methods, and bacteriology. Into such training embroidery as mere fancy-work does not enter; art principles and educational significance being determining factors, and individuality being demanded in the student's work. She must be something more than a skilful needle-woman.

The same philosophical attitude is preserved in the teaching of cookery, and the young woman trained in these normal classes is not a simple cook; she is a chemist and a dietary expert, understanding both the theory and the practice of

DOMESTICATION—DOMICILE

her art. It is evident that educators do not view the subject from a merely utilitarian view-point. The educational value of domestic science and art are recognized and emphasized. As instructors in these branches, women of sound education and thorough professional knowledge are required. Schools and colleges in all parts of the country are demanding such teachers; and the vacation schools, settlements, and other institutions of all large cities in the East claim a large number of them. One sphere which is opening to women with such qualifications is that of the dietary expert in penal and philanthropic institutions. A field so large as that offered to graduates of schools of domestic science and art will not soon be overcrowded.

Domestication, the modification of animals by deliberate interference with their food and surroundings, with the work of functions they perform, but especially with their breeding. Man has exterminated some animals—for example, birds, and propagated others—for example, fishes; he has made many become rare, shy, and cunning, while others (for example, dogs and cats) find shelter in his dwellings; he has kept some captive, like the fish in the pond; tamed others for his service, like horses and oxen; he has preserved some artificially from their enemies, because of their rarity, and others because of their utility. When a distinct breed has been produced by human interference, in most cases deliberately by artificial selection, we call the result domestication. Strictly "domesticated animals" correspond to strictly "cultivated plants"; in both cases the organisms have been modified, more or less fixedly, from their natural or wild state, by changes in food and environment, function, and breeding.

Domestication began long before the dawn of history (see AGRICULTURE; ANTHROPOLOGY; DOG). Among lower animals, silk-moths (see SILK) and hive bees (q.v.) have been for long controlled, and to a limited extent modified. Among fishes, gold-fish (q.v.) may certainly be regarded as domesticated for decorative purposes. Birds include many illustrations of domestication—pigeons, fowls, ducks, geese, peacocks, turkeys, guinea-fowls, canary-birds, etc. Among mammals, dogs and cats, horses and asses, cattle, sheep and goats, elephants, camels, reindeer, pigs and rabbits, etc., have been domesticated, and have given rise to many different breeds. The complete list is not a long one, yet probably it will not be increased. To admit of domestication, animals must generally be social and docile in their habits, and must be capable of retaining fertility under changed conditions.

The process of domestication, as far as deliberate control is concerned, is for the most part equivalent to selective breeding. Different breeds differ from natural species in being usually mutually fertile. In other words, while two domestic races may be externally more different than are two nearly related species in nature, the reproductive elements in the first case cannot differ as they must do in the second. Thus crossing is usually successful between domestic breeds, only rarely between adjacent natural species. When we pass beyond selective breeding to inquire into the conditions of variation, a much more difficult problem is raised. In regard to some changes which crop

up in domestic animals, we cannot do more at present than refer them to variations in the unstable germ-cells, and to the intermingling of sexual reproduction. Where the intercrossing is regulated, the importance of the latter is especially obvious. These germinal changes may, however, as the organism grows, find expression in the continually variable rhythm between nutrition and reproduction, between growth and multiplication—the great antithesis of organic life. But while considering this internal aspect, we have at the same time to recognize the importance of external influences, especially of altered climate and diet. These hinder or abet the constitutional or inherited tendencies, and may in course of time bring about important new results. Domesticated forms are more variable than their wild relatives; the males are more variable than the females; and the offspring of hybrids are more unstable than the hybrids themselves.

The results of domestication are very varied. Sometimes the changes induced and cultivated have been comparatively slight, in other cases they have amounted to the evolution of new species. These changes are abundantly illustrated in Darwin's classic work on variation under domestication.

Domett, dōm-ēt' or dōm'ēt, Alfred, English poet: b. Camberwell, Surrey, England, 20 May 1811; d. London 12 Nov. 1887. He was the original of Browning's 'Waring.' He lived in New Zealand, 1842-71, and became a colonial statesman of eminence. His verse attracted much attention, the best specimens being in the volumes 'Ranolf and Amohia' (1872); and 'Flotsam and Jetsam: Rhymes Old and New' (1877). See Gisborne, 'New Zealand Rulers and Statesmen' (1897).

Domicile is the permanent, fixed home of a person, with no present intention of removing therefrom. A person traveling from one city, State, or country into another does not change his domicile and create a new one at every place he stops, but the place to which he intends to return and reside permanently is his domicile. Generally speaking, a person can have but one domicile at one time; but for different purposes, he may have more than one domicile at one time. Some things for which it is necessary to have a domicile are: administration of a person's estate, jurisdiction, taxation, and homestead exemptions. In America, the place at which a person exercises his political rights, and privileges, and which he calls his home, is considered his domicile. The two things necessary to a domicile are an actual residence and a present intention of remaining there.

After a person has once acquired an actual domicile, he does not lose it by a temporary absence, no matter how long it is continued, if he intends to return; and in cases where a person changes his domicile he does not lose the old place of domicile, until he has actually acquired the new one. While the intention of the person enters into the question of domicile, it is not a controlling feature; and in a change of domicile the intention must be reinforced by some act, such as exercising a political right, engaging in business, paying taxes, and executing a will, according to the laws of the place; all of which are evidence of the intention to create a new domicile. When persons are mar-

DOMINANT — DOMINICA

ried, the wife acquires the domicile of her husband; and all children born acquire the domicile their father had at the time of their birth. If a widow with minor children marries, the domicile of the children is not changed until there is an actual removal. Illegitimate children acquire the domicile of their mother in some jurisdictions; if acknowledged by their father, they acquire his domicile.

A person absent from home on the service of his government, such as an ambassador, consul, soldier, or sailor, does not change his domicile; unless, after the service is finished, he continues to reside at that place. A convict or prisoner, a person attending a college or university, does not change his domicile. A person may acquire a commercial domicile in a place different from that in which he lives. When a person goes to a foreign country and engages in business there, he is considered a merchant of that country; and it makes no difference what the relations of the government of the countries are with one another.

A guardian cannot change his ward's domicile from one country or State to another; and it is doubtful even if he can change the domicile from one county to another in the same State. The nature and purpose of the appointment of a guardian may, however, change the general rule. The appointment of a guardian will not prevent the ward from changing his domicile. Although the domicile of the wife is considered as that of the husband, yet in actions for divorce, a husband, after giving his wife a cause for divorce, cannot acquire another domicile so as to deprive her of that right. In wills, the law of the domicile of the testator governs as to the validity of the execution and the distribution of personal property; but as to real estate, if it is to pass under the will, the testator must execute the will according to the laws of the place where the property is situated. Corporations are considered as domiciled in the county or State from which they have derived their charters.

Dominant, in music, is the fifth note above the tonic or keynote of any scale. It is always major in both major and minor modes, as its harmonies rule or determine the scale. Originally so called because in the ecclesiastical system it was the principal reciting note of the Gregorian chant. It also marks the division of the scale into two co-ordinate parts, as in a fugue when the subject commences with the tonic the answer starts with the dominant, or the reverse. In the sonata form it used to be an almost invariable rule to start the second subject in the dominant key.

The *dominant chord* is the major triad on the fifth of the major or minor key. Thus of *C* the triad would be *g-b-d*. A *dominant seventh* is formed by adding a minor seventh to the triad. Add *f* to the dominant triad given above and you have the dominant seventh of *C*.

Domingo, San. See SAN DOMINGO.

Dom'nic, Saint, founder of the order of Dominicans or Preaching Friars: b. Calahorra, in Old Castile, Spain, 1170; d. Ravenna, Italy, 6 Aug. 1221. According to the legendary story of his life his future eminence in the Church was foreshown to his mother before his birth by preternatural premonition, for she dreamed that she saw a dog presenting to her child a flaming

torch with which to set the world ablaze. This explains the meaning of the dog with torch in his mouth, seen in many pictures of Saint Dominic. In childhood he gave signs of extraordinary piety and love of ascetic practices. At 17 he entered the University of Palencia (removed later to Salamanca), and devoted himself to the study of philosophy and ancient literature. Here he once sold his clothes in time of famine to obtain the means of relief for the poor; on another occasion he offered himself to be a slave to the Moors in exchange for a widow's only son. He stayed in the university 10 years, and, having been ordained priest, was made a member of the cathedral chapter of Osma, and in that station was the zealous assistant of the bishop in suppressing abuses in the Church. He accompanied this bishop on an embassy to France in 1203, and in passing through Provence was grieved by the extreme laxity of morals in clergy and laity and the alarming progress of the various Manichæan sects. Dominic vowed himself to a life of evangelical labor among those sectaries, and resolved to make all possible efforts for the correction of the evils which menaced the existence of the Church in those parts. There were already in the field legates commissioned by the Pope to win the erring back to the fold; but Dominic was scandalized by their worldly pomp, and declared that not in costly attire and with a showy retinue should they approach the misguided Albigensians and poor men of Lyons, but barefoot and without purse or scrip; and the papal envoys, persuaded by the words of the zealous evangelist, laid aside their state and for a while followed the examples of humility and zeal set by Dominic. But their preaching proving unfruitful, they retired from the field and reported to Rome their failure. Nor was Dominic himself rewarded with much success, though the annals of his life tell of great miracles which attended his progress through the country. Then resort was had to force, and a crusade against the Albigensian heretics was proclaimed; which was conducted by Simon de Montfort with extreme severity till, at his death in the siege of Toulouse, resistance on the part of the Albigenses was overcome. No proof exists that Dominic either prompted the crusade or had any part in it; but it is certain that he was a friend of Simon de Montfort and of his family. He quit the country in 1217, one year before the end of the war, and withdrew to Rome where he spent the remainder of his life in organizing the order of Preaching Friars. He arranged the prayers and meditations of the devotion called the 'Rosary,' much in use by Roman Catholics in all parts of the world. See DOMINICANS; ROSARY. Consult: Drane, 'Life of Saint Dominic'; Lacordaire, 'Vie de Saint Dominique.'

Dominica, döm-în-ē'kă, or **Dominique**, döm-ē-nēk', West Indies, an island in the northern half of the Caribbean chain of the Lesser Antilles. (See ANTILLES.) It is the largest of the British Caribbees, being 29 miles long, 16 miles broad, and having an area of 291 square miles; it has also the highest summit of this volcanic island chain, the Morne Diablotin (5,314 feet), several thermal springs, and an old crater-lake about 2,800 feet above sea-level which formerly "was flooded by boiling water from springs bubbling up from the bottom, and every

DOMINICAL LETTER—DOMINICAN REPUBLIC

five minutes upheaving in a foaming geyser." The area of this lake was diminished by landslides which occurred in 1880, but it is still of great depth. The rainfall of the island is very abundant. The summer temperature is about 80° F.; that of winter, spring, and autumn about 70° F. An interesting part of the population is a group of Caribs (q.v.), though these aborigines are now largely mixed with the blacks. "They inhabit the mountains of the interior, and make their livelihood by weaving a peculiar basket which is universally used in the island for carrying baggage." The blacks referred to, descendants of African slaves of the period when Dominica belonged to France, are by far the most numerous element; they, as well as most of the white inhabitants, speak a French patois, and "still look upon the British owners as foreigners." With the exception of the Indians, the people live near the coasts. In the luxuriance and beauty of its vegetation, Dominica excels the other neighboring islands. Its soil is a rich brown mold, in which all tropical products grow readily. Of its 186,240 acres, two thirds are crown lands, but the government has utterly failed to promote agriculture, which is now nearly ruined. Exports are cattle, cocoa, lime-juice, rum, molasses, and sugar. The revenues do not equal expenditures, and taxes are increasing. Dominica is a presidency, belonging to the British Leeward Island administrative group, which includes also St. Christopher, Nevis, Antigua, Barbuda, Montserrat, Redonda, and the British Virgin islands, the seat of the Leeward government being at St. John, Antigua. The local government is conducted by a commissioner, or president, an executive council of seven members, and a legislative assembly. These officials exercise their authority at the small town of Roseau, which is situated on the western side of the island, and has wide and regularly paved, but deserted, streets, a botanical garden, a public library, and French (Catholic) and English churches. The name of the island (from Spanish *Domingo*, Sunday) is due to the circumstance that Columbus discovered it on the first day of the week, 3 Nov. 1493. The warlike Caribs retained control of it during two centuries, but little by little French settlers gained a foothold, and in the 18th century its possession was regarded as essential to the maintenance of French prestige in the West Indies, owing to its situation between the important dependencies of that country, Martinique and Guadeloupe. For that very reason the English insisted upon its surrender, in the final balancing of international accounts after the imperial wars, early in the last century. Many laborers have migrated to South America in search of employment. R. T. Hill says, in his 'Cuba and Porto Rico, with the Other Islands of the West Indies': "Formerly the slopes of Dominica were covered with coffee-trees, but this industry has practically disappeared. In 1843 there was as much as 1,333,000 pounds of coffee, besides rum, sugar, and molasses. The coffee culture even reached 2,500,000 pounds in 1828. Now the whole of this industry has vanished, except a few trees set out within recent years. Faint attempts are being made to increase the production of cocoa, limes, and lime-juice, as well as of essential oils." It would be fairer, however, to ascribe Dominica's economic decline

to the low price of both of her natural products, sugar and coffee. The population in 1881 numbered 28,211; a decade later it was only 26,841; and the exodus still continues.

Dominical Letter (from Lat. *Dominica*, Sunday), properly called Sunday letter, one of the first seven letters of the alphabet used in calendars to designate the Sundays throughout the year. The ancient Romans used the first eight letters, A-H, to denote their nundinal period; the early Christians dropped the eighth and adopted the remaining seven to indicate the days of the Hebrew week. These seven letters are employed to show on what days of the week the days of the month fall throughout the year. One of those seven letters must necessarily stand against Sunday, and is printed as a capital, and called the dominical letter or Sunday letter; the other six being inserted in different type, to denote the other six days of the week. Now, since a common Julian year contains 365 days, if this number be divided by seven (the number of days in a week), there will remain one day. If there had been no remainder it is obvious the year would constantly begin on the same day of the week; but since one remains, it is plain that the ordinary year must begin and end on the same day of the week; and therefore the next year will begin on the day following. Hence when January begins on Sunday, A is the dominical or Sunday letter for that year; then, because the next year begins on Monday, the Sunday will fall on the seventh day, to which is annexed the seventh letter, G, which, therefore, will be the dominical letter for all that year; and as the third year will begin on Tuesday, the Sunday will fall on the sixth day; therefore F will be the Sunday letter for that year. Whence it is evident that the Sunday letters will go annually in retrograde order, thus, G, F, E, D, C, B, A; and in the course of seven years, if they were all common ones, the same days of the week and dominical letters would return to the same days of the months. But because there are 366 days in a leap-year, if the number be divided by seven, there will remain two days over and above the 52 weeks of which the year consists. And therefore, if the leap-year begins on Sunday, it will end on Monday; and as the year will begin on Tuesday, the first Sunday thereof must fall on 6 January, to which is annexed the letter F, and not G, as in common years. By this means, the leap-year returning every fourth year, the order of the dominical letters is interrupted, and the series cannot return to its first state till after four times seven, or 28 years; and then the same days of the month return in order to the same days of the week as before. This method of indicating the days still holds its place in Church calendars without variation from the beginning.

Dominican Republic, West Indies, a country which occupies the eastern and central portions of the island of Santo Domingo, or Haiti: bounded on the north by the Atlantic Ocean, on the south by the Caribbean Sea, on the west by the republic of Haiti, and separated by the Mona Passage from Porto Rico on the east. Its area is commonly estimated at 18,045 square miles.

Political Divisions.—The country is divided into six provinces and five maritime districts, each administered by a governor appointed by

DOMINICAN REPUBLIC

the president; the governors, in turn, appoint the prefects who preside over communes, cantons, and sections. Principal cities and villages are: The capital, San Domingo city (q.v.), regarded as one of the most perfect specimens of a 16th century Spanish-American town, but now in decadence; Santiago de los Caballeros (q.v.), also one of the oldest places in the New World, situated in the northern plain called Vega Real, about 160 miles northwest of the capital; Puerto Plata, on the north coast, connected by rail with Santiago; Concepcion de la Vega, on the river Camu, near Santiago; Azua de la Compostella, on the south coast, about 55 miles west of San Domingo city; Samaná, on the bay of that name; Monte Cristi, on the north coast; and Seybo, 50 miles northeast of the capital. The last four are very small places, of 1,000 to 5,000 inhabitants.

Outlying Territory.—For adjacent islands see SANTO DOMINGO, ISLAND OF. Some of the general physical characteristics of the main island are also discussed more fully in that article.

Topography and Physical Geography.—The mountains—the centre and culmination of the Great Antillean uplift—form several cordilleras or roughly parallel ranges. The highest peak, Mount Tina (10,300 feet), is northwest of San Domingo city, and near the centre of the island are numerous peaks from 8,000 to 9,000 feet high. While the enormous mass of these mountains, occupying four fifths of the island, renders much of the territory nearly inaccessible, between the ranges lie plains, some of which are wonderfully fertile. Toward the north and west are the famous Vega Real and the plain called Despoblado de Santiago; near the south coast the rich valley of Baní, which extends between the Nizao and the Ocoa; and in sequence the valleys of Azua, San Juan, or Antigua Maguana, Santo Tomé, Onceano, Hincha, Quava, and others; toward the east, extending even to Cape Engaño, is a region in which the *praderas* or *llanos*—valleys, meadows, or plains—are most common. Even the ridge of the Cibao Mountains sinks to a height of only 1,000 feet at its eastern end.

Rivers and Harbors.—The Ozama and Isabela rivers unite to form the port of San Domingo after receiving the waters of many smaller streams, such as the Yavacao, the Monte Plata, and the Savita. The Haina, or Jaina, which empties into the sea about 10 miles west of San Domingo city, and the Nigua, whose course is still farther toward the west, enclose a very beautiful plain which was a source of wealth during the Spanish period. The Nizao flows southward between fields of sugarcane and meadows where herds of cattle graze. Other rivers are the Artibonito, Yagui, Yuna, Naranja, and Magua. The coast-line, about 940 miles in extent, includes the Bay of Samaná—a well-sheltered harbor extending westward from the Mona Passage, its average width being 12 or 13 miles and its length more than 25 miles. It has been pointed out that this bay would accommodate the largest fleets, and that defensive works placed at its entrance would make it practically impregnable; its strategic value is certainly so great that it should be reckoned one of the republic's chief assets. The other open ports are: on the north,

Puerto Plata, Monte Cristi, Macoris, and Sanchez; on the south, San Domingo city and Azua.

Geology and Mineral Resources.—The geology of the island, as described by Blake, Marvin, and others, is similar to that of the eastern ends of Cuba and Jamaica. There are, according to Robert T. Hill, four principal formations: "the older mountain rocks, of Cretaceous and Tertiary Age, made up of igneous rocks and clays, mantled by gravels and crystalline limestone; the white limestones of Tertiary Age; recent alluvial formations; and the coast limestone of elevated reef rock. No recent volcanic rocks are known." For the Antillean mountain system, compare CARIBBEAN SEA and CENTRAL AMERICA. It is customary to say that the mineral resources of the republic have been either neglected or exhausted; and it is, indeed, quite certain that, whereas the Spaniards obtained large amounts of gold and silver, especially the former, from the mines that were worked during the early years of colonization, recent reports made by American experts are not especially favorable with regard to these two metals. The fact, however, seems to be that gold exists quite generally, but not in paying quantities if we allow for high-priced labor. The profits of the old mines were won by the labor of native and African slaves. Copper, iron, manganese, platinum, tin, marble, antimony, and chalcodony are found; and the analogy of the Santiago de Cuba mining region would suggest that the deposits of the first three metals deserve particular attention. Valuable petroleum lands have been found near Azua.

Soils and Climate.—The diversities of both soil and climate are greater than elsewhere in the Antilles. Thus, the Vega Real is fertile and well-watered; the Santiago plain, its western prolongation, is a desert. The soil of the western part of the plain of Seylo is gravelly, while that of the eastern part is composed of loams and clays. The country immediately surrounding Azua is barren; but the best sugar estates on the island are only three miles away—and the sugar-lands of no other West Indian island can quite rival in fertility San Domingo's best. The heat in low-lying and sheltered districts is intense: "fatal to Europeans," says an eminent Spanish authority. At an elevation of more than 1,600 feet, the nights are cold. Coasts and plains of a moderate elevation which have the benefit of the east wind are regarded as comparatively healthful: the capital, for example, where the temperature averages 64° F. in the morning and 85° F. at noon. The climate of Santiago de los Caballeros is fairly salubrious. The arid regions are chiefly the lower slopes on the windward side of the island; in the high mountains the precipitation of moisture is excessive. The rainy season culminates in May and June.

Forests, Flora, and Fauna.—Cedar, lignum vitae, mahogany, and other cabinet-woods, as well as timber used in house- and ship-building, are taken from the forests, which also produce logwood, fustic, etc. (see list of exports): the most luxuriant growths, however, have no present commercial importance, because adequate means do not exist for bringing them from the interior regions to the coast. As in other parts of the Antilles, the forms of vege-

DOMINICAN REPUBLIC

table life are varied and of special interest, while precisely the reverse is true of the fauna. See **SANTO DOMINGO, ISLAND OF.**

Agriculture.—In the south and west are the principal sugar plantations; the area of tobacco is the north and some parts of the uplands of the interior; coffee grows readily in the mountain regions, and in the district of Barahona its production on a large scale has begun; the cultivation of cocoa, like that of sugarcane, has increased rapidly since about 1885; cattle raising also receives a little more attention than formerly was the case; tropical fruits, especially bananas, flourish nearly everywhere.

Exports and Imports.—An official résumé of the exports through the custom-houses of the republic during the first half of 1902 shows the values of the principal articles of export to have been as follows:—sugar \$1,962,814.18; cacao \$750,530.32; coffee \$188,500.00; bananas \$37,836.50; wax \$34,636.49; leaf tobacco \$26,974.07; goatskins \$22,051.56; ox-hides \$20,313.04; campeche wood \$10,730.00; mahogany logs \$8,217.52; guayacán \$7,078.32; honey \$5,056.00; divi-divi \$4,176.00; espinillo wood \$2,701.45; live animals \$2,691.00; bera \$1,971.50; mahogany forks \$1,570.00; sisal rope \$1,419.40; and, less than \$1,000 each: raw cotton, deer horns, yarey fibre, caya wood, cedar, tortoise shells, moss, molasses, mora wood, rum, and sole leather. The total value of exports in 1901 was \$5,190,036.64. Of imports, the total value in ordinary years is somewhat more than one half that of exports, the large items being cotton goods, hardware, and provisions.

Railways, etc.—Besides the railway referred to above, which crosses two mountain ranges and connects Santiago with Puerto Plata, another line to furnish transportation from Samaná Bay to Santiago has been built to a point beyond La Vega. There are 430 miles of telegraph, and 51 post-offices. The difficulties of communication between the various districts of the country, primarily due to the cordilleras, are in part attributable to the government's neglect to build good highways—without which peace will never be assured. Several concessions for railways were granted in 1901. The republic has regular communication with America and Europe by means of the lines of steamships calling at its ports.

Government.—The constitution vests the executive power in a president chosen by an electoral college for a four years' term only; both he and the vice-president, however, are eligible for immediate re-election. The congress (a single house) is composed of two members from each province and maritime district, elected by direct popular vote with restricted suffrage. The cabinet in 1902 included the following secretaries: of interior and police; of war and marine; of foreign affairs; of justice and public instruction; of public works; of finance and commerce; and of posts and telegraphs.

Finances.—The customs revenue fluctuates a good deal. Thus, in 1896 it was \$1,545,450; but \$2,392,052 in 1900; while the customs receipts for 1901 amounted only to 1,876,145 pesos, according to the report of the Belgian consul at San Domingo city; and again the United States minister to the republic shows that the receipts from the several ports during November 1902 were \$87,000, or less than one

half as much as in November 1901. The export tax on sugar was repealed 1 March 1902; otherwise duties are levied on both imports and exports. The public debt amounted to \$13,589,750 before 1898. In 1901 the foreign debt amounted to about \$21,000,000 and the internal debt to \$2,845,550 gold and \$10,126,629 silver. The San Domingo Improvement Company, of New York, was entrusted with the collection of the customs duties 1 March 1893.

Army and Navy.—A regiment of soldiers is usually stationed in each province, and these, with the reserve corps, constitute the army. The government has three small gunboats.

Population.—The number of inhabitants in 1888 was, on high Spanish authority, 417,000, but according to an official estimate 610,000. No recent enumeration is trustworthy. The Despoblado region—the nearly uninhabited district of high mountains, inaccessible valleys, and virgin tropical forests—comprises, roughly speaking, the central third of the entire area of the island, or one half of the Dominican republic: it is the wide border-land fought over by the Haitians and the San Domingans. The latter, of blended Spanish, Indian, and negro blood—with the small proportion of white descendants of the Spanish colonists and foreign merchants—occupy a restricted area, and, it is thought, scarcely number 600,000. Spanish is the language most in use.

Education, Religion, Judiciary.—Free primary instruction is offered by the communes, with the aid of the central government; the system including also superior technical and normal schools, and a professional school or university. There are about 40 newspapers. The state religion is the Roman Catholic. Religious toleration under "certain restrictions" is assured by the government's present policy of encouraging immigration. There are, beside the supreme court, 11 district tribunals and the municipal courts.

History.—Columbus, on his first voyage to America visited the north coast of the island and left a few of his men. These were killed by the natives; but the colony of Isabela, established on his second voyage, endured until the colonists were transferred to a more healthful locality. His settlement on the south coast, near the present city of San Domingo, was made during his third voyage—that of 1498. Spanish settlements existed also at Concepcion de la Vega, Puerto Plata, Santiago de los Caballeros, and Bonao in the first decade of the 16th century. The cultivation of sugarcane began in 1506. Three years later Christopher and Bartholomew Columbus were imprisoned by Bobadilla in the citadel of San Domingo. The natives were set to work in the mines and fields; and very soon shiploads of Indians were being transported from other islands to replace those who died under the hardships of this forced labor. (see **BAHAMAS**). Negroes were brought from Africa for the same purpose, a considerable number of black slaves reaching the colony before 1522. There was a short period of prosperity; before the middle of the century, however, the most enterprising colonists were drawn away by the superior attractions of Mexico and Peru, and the country began to suffer from the attacks of English and French buccaneers, who established their headquarters on a small island near the northwest corner of

DOMINICANS—DOMINIS

Haiti. In the course of a century and a half the section west of the Despoblado, and now known as the republic of Haiti, was won for France. The Spanish government at the close of the 18th century abandoned the eastern section as well, the entire island passing, first, under French control; but soon afterward the successes of Toussaint L'Ouverture and Dessalines (q.v.) united west and east in one country, independent of the European powers and governed by the black revolutionists of Haiti. Between 1809 and 1821 Spain again held the eastern section, and the old name Santo Domingo was revived with that limited application; but in the year last mentioned the San Domingoans revolted. Many of the Spanish families withdrew permanently from the island. San Domingo and Haiti were united from 1822 to 1843, together forming the republic of Haiti. The final separation took place in 1844, when the Dominican republic was established. Spain reasserted her authority once more for a brief period (1861-5); with that exception the many struggles through which the country has passed since 1844 have been due either to revolutions or to Haitian antipathy. In 1869 a treaty for the annexation of the Dominican republic to the United States was negotiated, during Gen. Grant's presidency, but was defeated in the United States Senate. A revolution which drove President Baez into exile expressed the resentment of the San Domingoans when this failure was made known. Comparatively good order was maintained for a few years, beginning in 1890, but the most violent methods were resumed by political leaders in 1898-9, and continued in 1902-3. President Jimenez was forced by a revolutionary uprising to resign his office in May 1902. His successor, Vasquez, was driven from power early in May 1903, after severe fighting, attended with heavy losses.

Bibliography.—Bulletins of the International Bureau of the American Republics; Chevalier, 'Lettres sur les maladies de St. Dominique,' etc.; Edwards, 'An Historical Survey of Saint Domingo'; Fabens, 'Life in San Domingo'; Guillermin, 'Journal historique de la révolution de la partie de l'Est de Saint-Dominique'; Harvey, 'Sketches of Hayti,' etc.; Hazard, 'Santo Domingo, Past and Present'; Hill, 'Cuba and Porto Rico, with the Other Islands of the West Indies'; Perkins, 'Reminiscences of the Insurrection of St. Domingo'; Sumner, 'Violations of International Law and Usurpations of War Powers': a speech delivered in Senate of United States 27 March 1871.

MARRION WILCOX.

Dominicans, or Friars Preachers, or Preaching Friars (*Fratres Prædicantes*), the religious order founded by St. Dominic. While laboring in Provence for the conversion of the Albigenses, Dominic associated to himself 16 disciples eager, like himself, to devote their lives to the work of reclaiming heretics and ministering to the spiritual needs of the poor and ignorant. In 1215 he visited Rome to obtain from the Holy See approval of the institute he proposed to form. Of the 16, 8 were French, 6 Spanish, 1 Portuguese, and 1 English. The Pope (Innocent III.), in conformity with the decree of the Lateran Council, then in session, against approval of new religious orders, refused again and again his consent, but at last

promised to give his approbation on the condition that the friars should adopt as their own the monastic rule of the Augustinians. The condition having been fulfilled, the order was formally approved in 1216 by Innocent's successor, Honorius III. The costume of the friars was to resemble that of the Augustinians, and to consist chiefly of a black cassock and rochet; but a few years afterward this was changed for the white habit and scapulary with outside black mantle, which is still the costume of the Dominicans. Their name Black Friars was given them because of the black mantle worn out of doors. The memory of their great monastery in London is preserved in the name Blackfriars Bridge. Houses of the new order were immediately founded in France, the Rhineland, and Italy; and in 1221 was held the first general chapter of the order at Bologna in which were represented 60 convents of preaching friars. That same year arrived in England the first band of Dominicans, 12 of the brothers in charge of Gilbert de Fremey. At this chapter an addition was made to the rule of the order, by which the Dominicans were forbidden to hold any possessions or have any fixed incomes; but to live by the voluntary alms of the people: thus the Friars Preachers became mendicant friars like the Franciscans. All the universities were opened to the young scholastics of the order, and soon many preaching friars attained the foremost rank as philosophers, divines, canonists and scholars. Among divines and philosophers the Dominicans Albert the Great and Thomas Aquinas hold the highest places; the celebrated German mystics and divines Meister Eckhart, John Tauler, and Henry Suso were Dominicans. The great mediæval encyclopædic work, *Speculum Majus*, was the work of a Dominican, Vincent of Beauvais. The highest places in the Church have been occupied by Dominicans; since the order was founded there have been 3 Dominicans popes, 60 cardinals, 150 archbishops, and more than 800 bishops. A second and a third order were also founded by St. Dominic, the second order being for women, and the third for men and women living in the world, engaged in secular pursuits and married. (See TERTIARIES). The Dominican houses suppressed in England by Henry VIII. numbered 58.

Dominique. See DOMINICA.

Dominis, Marco Antonio de, mār'kō ān-tō'nē-ō dā dōm'ē-nēs, Italian theologian and ecclesiastic: b. Arbe, an island in the Adriatic, 1566; d. Rome 28 Sept. 1624. He studied in the college of the Jesuits at Loretto and in the University of Padua, and was made bishop of Segni 1596, and archbishop of Spalatro or Spalato 1602. Here he projected schemes for the reformation of the Church and unification of Christendom, but came into disfavor at the Roman court and had to quit, take refuge at Venice, where he made the acquaintance of Bedell, chaplain of the English embassy, afterward bishop of Kilmore in Ireland. De Dominis accompanied Bedell to England and through his influence obtained from King James the deanery of Windsor and other places in the Established Church. He was zealous for the overthrow of

the papal system and published in London (1670) a work in Latin, 'De Republica Ecclesiastica,' designed to prove that the Pope possesses in the Church only a primacy of honor not of jurisdiction. In 1619 was published his translation into English of Fra Paolo Sarpi's 'History of the Council of Trent.' He returned to Rome 1622, at the instance of the Spanish ambassador at London, who led him to believe that he would be welcome there and would be raised to the cardinalate. He published a recantation of his subscription to the Anglican articles of religion, but his hopes of honors at Rome were disappointed, and in letters to his friends in England he recanted his recantation: but the letters never reached their destination, having been seized by the papal officers. He was thrown into prison by order of Urban VIII. and there died 1624. After his death he was adjudged a heretic: his body was disinterred and burned, and the ashes thrown into the Tiber. In 1611 was published his tract, 'De radiis visus et lucis in vitris perspectivis et iride' ('Of the Rays of Vision and Light in Perspective Glasses and the Rainbow'), in which is probably for the first time proposed the true theory of the rainbow.

Domin'ium (Lat. *dominus*, a master), in Roman law, the right by which any one exercised control over property, and by which he was entitled to retain or alienate it at pleasure, as opposed to a mere life interest, or possessory or equitable right. *Dominium directum*, in feudal law, is the interest or superiority vested in the superior; and *dominium utile* is the interest in property vested in the vassal, which amounts to the right of merely using it (see *SERVITUDES*, *USUFRUCT*) as distinguished from that of his lord's ownership and supremacy.

Domino. See MASK.

Domino Whist. See FIVE OR NINE.

Dominoes, a game played with small flat rectangular pieces of ivory, about twice as long as they are broad. They are marked with spots varying in number. Each domino has two sets of spots ranging in number from 0 up to 12, which are distributed in all possible combinations—0-0, 0-1, 0-2, 0-3, etc., to 0-12; then 1-1, 1-2, 2-3, 2-4, and so on up to 12-12. Those which have the two sets of spots alike—2-2, 3-3, etc., are called double twos, double threes, etc. The game is to appearance remarkably simple, but is played in a variety of ways. The general principle of all the varieties is that when one player leads by laying down a domino, the next must follow by placing alongside of it another which has the same number of spots on one of its sides. Thus if the first player lays down 6-4, the second may reply with 4-8, or 6-7, etc.; in the former case he must turn in the 4, placing it beside the 4 of the first domino, so that the numbers remaining out will be 6-8; in the latter case he must turn in the 6 to the 6 in like manner, leaving 4-7, to which his opponent must now respond. The player who cannot follow suit loses his turn; and as the object of the game, modified by special conditions in the different varieties, is to get rid of all the dominoes in hand, or to hold fewer spots than your opponent when the game is exhausted by neither being able to play, it is a special point of play to shut out your opponent when it can be done without injury to your own hand.

Dom'inus, the Latin word which we commonly render by "lord," but which more properly signifies the master of a house, and his eldest son, as opposed to slave (*servus*). The Scottish "dominie," in the sense of schoolmaster, is of course taken from it, as is the same term in America, where in some places it is the title of a minister of the Dutch Reformed Church, and in others is applied to Protestant clergymen generally.

Domitia, dō-mīsh'ī-a, Roman empress: b. Gaul about 56 A.D.; d. Rome about 100 A.D. She was the daughter of Domitius Corbulo, a general of Nero's reign. She was married first to Ælius Lamia, but the Emperor Domitian took her for his wife. Finding that her new husband intended to have her executed she caused his assassination in 96 A.D. Her subsequent career is uncertain.

Domitian, Titus Flavius Domitianus Augustus, Roman emperor: b. Rome 24 Oct. 51 A.D.; d. there 18 Sept. 96 A.D. He was a son of Vespasian, and brother of Titus, and made himself odious, even in youth, by his indolence and voluptuousness, and his cruel, malignant, and suspicious temper. He became emperor 81 A.D. At first, indeed, he deceived the people by acts of kindness, good laws, and a show of justice, so that their fears vanished; but he soon returned to his former excesses and cruelty. Agricola's victories exciting his jealousy, he recalled that general to Rome, and kept him in total inactivity. At the same time he spread terror through Rome by the execution of a great number of the first citizens. He gave himself up to every excess, and to the meanest avarice. He at last conceived the mad idea of arrogating divine honors to himself, assumed the titles of Lord and God, and claimed to be a son of Minerva. His principal amusement consisted in the shows of the circus. The misery of the people was, meanwhile, continually increasing; and after the revival of the law against high treason, which enabled almost anything to be construed into this crime, no one was secure of his property or his life. A paper fell into the hands of his wife, Domitia, in which she found her own name, and those of the two commanders of the prætorian guards, with many others, noted down by the emperor as victims. This discovery induced her to conspire against him, and he was killed by a freedman named Stephanus.

Domremy-la-Pucelle, dōn-rā-mē-lā-pū-sēl (original, Domremy; La Pucelle, that is, The Maid, has been added in honor of Joan of Arc), a small village in the department of the Vosges, in France, not far from Vaucouleurs, in the department of the Meuse. It is noted for being the birthplace of Joan of Arc. The village contains a bronze statue of the heroine, and another monument to her, and the cottage in which she was born still stands. A chapel on a neighboring hill marks the spot where she is said to have learned of her great mission. There is here also a museum. Domremy was exempted from taxation till the Revolution, in honor of the warrior-maiden.

Don (Lat. *dominus*), a Spanish title of honor, originally given only to the highest nobility, afterward to all the nobles, and finally used indiscriminately as a title of courtesy. It corresponds with the Portuguese Dom. During the Spanish occupation it was introduced

and became naturalized in some parts of Italy, particularly in Naples.

Don Carlos. See CARLOS.

Don César de Bazan, *dōn sā-zār dū bā-zān*, the title of a French comedy founded on a portion of Hugo's play, 'Ruy Blas.' Don César is a ruined nobleman who changes his name, and in rags conducts himself with the happy, devil-may-care nonchalance of his better days.

Don Gerard, Dutch painter. See DOW, GERARD.

Don Giovanni, *dōn jō-vān'nē* (Italian form of Don Juan, the name of the hero), the title of an opera by Mozart, considered his masterpiece, produced at Prague 29 April 1787.

Don Juan, *dōn jū'an*, Sp. *dōn hoo-ān'*, the hero of a Spanish legend which seems to have had some historical basis in the history of a member of the noble family of Tenorio at Seville. According to the legend Don Juan was a libertine of the most reckless character. An attempt to seduce the daughter of the governor of Seville brought the indignant father and the profligate don into deadly conflict, in which the former was slain. Don Juan afterward, in a spirit of wild mockery, goes to the grave of the murdered man and invites the statue of him erected there to a revel. To the terror of Don Juan the "stony guest" actually appears at the table to bear him away to the infernal world. The tale has furnished the subject for many dramas and operas. The most famous of the latter is Mozart's 'Don Giovanni' (q.v.). Among the former are: 'Burlador de Sevilla' by Tellez; 'Don Juan ou Le Festin de Pierre,' by Molière; and 'The Libertine,' by Shadwell. The 'Don Juan' of Byron's poem bears no relation to the Don Juan of legend, save the name and libertine character of the hero.

Don Orsino, a novel by Francis Marion Crawford, published in 1892. The author's purpose is to describe a young man of the transition period in Rome after the unification of Italy. He chooses for his hero Orsino Saracinesca.

Don Pasquale, *dōn pās-kwā'lā*, an opera by Donizetti, produced 4 Jan. 1843 in Paris. It is considered one of the composer's best, although it never had a place in public estimation, such as was given to 'Lucie'; 'La Favorita'; 'La Figlia del Reggimento'; and others.

Don Quixote, *dōn kwiks'ōt*, Sp. *dōn kē-hō'tā*, a novel by Cervantes, in two parts, the first of which appeared at Madrid in 1605 and the second in 1615. The hero is a country gentleman who under the influence of the many romances he has read sets forth in search of adventures, accompanied by his squire, Sancho Panza (q.v.). From the hero's name is derived the word quixotic. For the author's aim in writing this book, see CERVANTES.

Don, or Dun, a river of Yorkshire, England, which rises near Cheshire, flows east and southeast and joins the Ouse after a course of about 55 miles. By artificial cuttings and canals it has been rendered navigable for vessels of 50 tons, to Sheffield, a distance of about 40 miles.

Don (ancient TANAI), a river of Russia, which issues from Lake Ivan-Ozero, in the government of Tula, and flows southeast and south-

west about 1,200 miles into the Sea of Azof, near the town of Azof, by three mouths, only one of which is navigable. The delta of the Don is an expanse of sandy flats, about 28 by 22 miles at the coast-line. Near its head is the important river-port of Rostov, and Taganrog also shares in the Don traffic. The Don has the most busy trade of all the rivers of south Russia. The navigation is generally stopped by ice for about three months of the year; nevertheless, by means of its lower course, in connection with the Volga, the south provinces of Russia receive much Siberian produce, and also manufactured goods from the interior of the empire.

Don, a river in the county of Aberdeen, Scotland. Its source is several small streams flowing from a bog about 1,900 feet above the sea. It flows east into the North Sea. It is about 75 miles in length. Its salmon fisheries are of considerable value.

Do'na Francis'ca, Brazil, a German colony in the state of Santa Catharina, lying between the Serra do Mar and the Atlantic Ocean, 14 miles inland from the port of São Francisco. Area, 97 square miles; pop. (1903) 21,000. Chief town, Joinville, with 2,700 inhabitants.

Donald, Elijah Winchester, American Episcopal clergyman: b. Andover, Mass., 31 July 1848. He was graduated from Amherst College, in 1869, entered the Episcopal ministry and has been rector of Trinity Church, Boston, from 1892. He has published 'The Expansion of Religion.'

Donaldson, Edward, American naval officer: b. Baltimore 17 Nov. 1816; d. 15 May 1889. He entered the navy in 1835; and in the Civil War took part in the attack on forts Jackson and St. Philip, in the passage of Vicksburg, and in the battle of Mobile Bay. He retired from active service in 1876.

Donaldson, James Lowry, American soldier: b. Baltimore 17 March 1814; d. there 4 Nov. 1885. He was graduated from West Point and entered the army in 1836. He fought in the Florida war, in the Mexican War, and in the Civil War. At the close of the latter he received the rank of major-general in the United States army. He wrote 'Sergeant Atkins' (1871), a story of the Florida war.

Donaldson, Thomas Leverton, English architect: b. London 19 Oct. 1795; d. there 1 Aug. 1885. He was professor of architecture at University College, London, 1841-65, and emeritus professor there for the rest of his career. He published 'Pompeii' (1827); 'A Collection of the Most Approved Examples of Doorways from Ancient Buildings in Greece and Italy' (1833), etc. Among buildings designed by him are University Hall, Gordon Square, London, and the Scottish Corporation Hall.

Donaldson, Washington H., American aeronaut: b. Philadelphia, Pa., 1840. In early life he was by turns a gymnast, a ventriloquist, a conjurer, and a tight-rope walker. A hotel proprietor presented him with a balloon, whereupon he became an aeronaut, and made himself famous all over the United States by his daring and reckless ascensions. On 15 July 1875, he made an ascension from the lake front in Chi-

cago and neither Donaldson nor his balloon was ever seen thereafter.

Donaldsonville, La., town, county-seat of Ascension Parish; on the Mississippi River, and the Texas & P. R.R.; about 30 miles in an air line south of Baton Rouge. It is the trade centre of a cotton, rice and sugar-growing county. Pop. (1900) 4,105.

Donatello, dōn-ā-tě'lō (properly, DONATO DI BETTO BARDI), a famous sculptor: b. Florence about 1386; d. Florence 1466. His family had several distinguished literati among its members, and repeatedly, from the middle of the 16th century, had given a doge to Venice. His first great works in marble were statues of St. Peter and St. Mark, in the Church of Or San Michele in his native city. His own favorite piece was the statue of an old man in senator's dress placed on the Campanile, and known by the name of Il Zuccone, or The Bald-Head. For the Church of St. John he executed a Penitent Magdalen in wood; but in this branch of art he was surpassed by his friend, Brunelleschi, with whom he made a journey to Rome to acquaint himself with its treasures. After his return to Florence he executed for his patrons, Cosmo and Lorenzo de Medici, a marble monument to their father and mother, which excited universal admiration. One of the principal ornaments of the Church of Or San Michele, is a marble statue of St. George, surpassed by no similar statue which has since been erected. This statue was ordered by the Guild of Armors (1416). Among his other leading works are a St. John the Baptist, in the Bragello; Judith and Holofernes, in the Loggia dei Lanzi; David, in the Museum, Florence; St. Cecilia, in profile, owned by Lord Elcho, in England. Notwithstanding his strictness he was honored as a father by all his scholars, among whom were Desiderio da Settignano, Benedetto di Majano, and Nanni d'Antonio. Consult: Radcliffe, 'Schools and Masters of Sculptors'; Perkins, 'Handbook of Italian Sculpture'; Clement, 'Sculpture'; and Vasari.

Donati, Giovanni Battista, jō-vān'nē bāt-tēs'tā dō-nā'tē, Italian astronomer: b. Pisa 16 Dec. 1826; d. Florence, 19 Sept. 1873. He was appointed in 1852 assistant at the observatory in Florence, of which he became director in 1864. Here he discovered, *inter alia*, the brilliant comet of 1858, which is known as Donati's comet. He afterward was instrumental in erecting the fine observatory at Arcetri, near Florence, and constructed a spectroscope of 25 prisms.

Donation Lands are lands donated by Congress to actual settlers, out of the public domain. On 4 Aug. 1842, the lands in east Florida were thrown open to public settlement, by the grant of a quarter-section (160 acres) to every able-bodied adult. On 27 Sept. 1850, a similar act was passed for Oregon, granting from a quarter-section to a full section according to conditions. Later acts provided for rights of reversion on these. Donations of land for coast defenses, from private individuals to the government, are provided for by law.

Donatists, a heretical sect in the 3rd century, and till the Vandal invasion a formidable opponent of the Roman Catholic Church in the Mediterranean provinces of Africa. The sect arose out of dissensions at Carthage over

the question of the readmission to church fellowship of those persons who in Diocletian's persecution had denied the faith either explicitly or implicitly, by giving up to the persecutors the Christian sacred books. On that point they were extreme rigorists, as also in holding that a priest or deacon could not validly administer baptism if he were himself in a state of sin. When Mansurius was consecrated bishop of Carthage, the faction, headed by one Donatus repudiated him as a *traditor*, one who had given up the sacred books; and when after his death (311), Cæcilian became bishop of Carthage, 70 Numidian bishops refused to have communion with him, as one that was consecrated by a *traditor*. They set up a rival bishop, Majorinus, and the schism grew steadily wider, being specially favored by the peasants. The schismatics were condemned by Melchiades, the reigning Pope, with three bishops of Gaul, in 313. This judgment was confirmed the next year by the council of Arles, and in 316 by the council of Milan, convoked under the protection of the emperor Constantine; but the Donatists paid no heed, and in 330 a council was held by 270 Donatist bishops who denounced their opponents as heretics. The peace not only of the Church but of the civil state was seriously compromised by uprisings of the fanatical multitude against the Roman Catholics throughout northern Africa, to repress which the severe laws enacted by the emperors were ineffective. St. Augustine, bishop of Hippo from 400 to his death in 430, labored zealously to restore peace to the Church. In 411 he held a conference with 279 of their bishops at Carthage. The sect early began to split up into independent smaller sects, and they disappeared from the page of history after the Vandal invasion in 429.

Donatus, dō-nā'tūs, Ælius, Roman grammarian and commentator who lived in the 4th century. He wrote an elementary work on the Latin language, 'De octo partibus orationis,' which served as a guide to the learning of Latin in the Middle Ages, and formed the groundwork of most elementary treatises until recent times. It was one of the books most frequently printed at the commencement of the art, several editions having been issued from blocks even before the invention of types.

Donau, dō'now. See DANUBE.

Donauwörth, dō'now-vért, Germany, a walled town of Bavaria, at the junction of the Wörnitz and Danube, about 25 miles north by west of Augsburg. The monthly live stock market is a source of wealth to the town. Pop. 4,083.

Don'caster, England, a municipal borough in the West Riding of Yorkshire on the Don. It has long been famous for its annual races, begun in 1703. Nearby are the ruins of Conisborough Castle, the stronghold of Athelstan in Scott's 'Ivanhoe.' Pop. (1900) 25,000.

Dondo, dōn'dō, West Africa, a town of Angola situated at the head of navigation on the Coanza River, and not far from the Loanda Railway. It has a considerable caravan trade and is an import coffee market. Pop. 3,000.

Dondrah (dōn'drā) or **Dondera Head**, the southern extremity of the island of Ceylon, a steep and rugged promontory, formerly the site of a temple.

Donegal, dōn'e-gal, county in the province of Ulster, Ireland; area, 1,190,269. About one half is good farming land, but the mountainous districts are rich in minerals. Pearl-mussels abound in the rivers. Pop. 185,635.

Don'elson, Andrew Jackson, American diplomatist; b. near Nashville, Tenn., 25 Aug. 1800; d. Memphis, Tenn., 26 June 1871. He was graduated at the United States Military Academy in 1820, and entered the army as a lieutenant of engineers. In 1822 he resigned, studied law, and also engaged in cotton raising in his native State. He filled a number of responsible offices; was private secretary to President Jackson in 1829-30; minister plenipotentiary to Prussia, and later to Germany, in 1846-9; was editor of the *Washington Union* in 1851-2; was candidate of the American party for Vice-President in 1856; and after his defeat retired to private life.

Donetz, dō-nyěts', or **Severnoi Donetz**, a river in Russia which, rising in the government of Kursk, flows almost due south about 400 miles into the Don.

Don'gan, Thomas, EARL OF LIMERICK, English colonial official: b. Castleton, Ireland, 1634; d. London, 14 Dec. 1715. After serving in the British and French armies he was appointed colonial governor of New York by the Duke of York in 1682. He gave the city of New York its first charter in 1686 and being accused of ignoring his pacific instructions regarding the French and Indians, and of inciting the Five Nations to war, resigned his commission in 1688, returned to England in 1691, succeeding to the earldom of Limerick in 1698.

Dongola, dōng'gō-lā, a province of Nubia, in Africa. The chief town of this district is of the same name. Pop. about 6,000.

Dongola Kid. See LEATHER.

Don'iphan, Alexander William, American military officer: b. Mason County, Ky., 9 July 1808; d. Richmond, Mo., 8 Aug. 1887. He began the practice of law in 1830 in Lexington, Mo. He was three times elected to the Missouri legislature. He served in the Mexican war, in which he made a brilliant record, capturing Chihuahua after an unexpected encounter with an army of 4,000 men. He was one of the peace commissioners at the convention which met at Washington previous to the Civil War.

Donizetti, Gaetano, gā-ā-tā'nō dō-nē-dzēt'-tē, Italian composer: b. Bergamo 25 Nov. 1797; d. there 8 April 1848. He studied music at Bologna under the distinguished Abbé Mattei. His first opera, 'Enrico di Borgogna,' was represented at Venice in 1818. In 1822 his 'Zoraide di Granata' gained him the honor of being crowned on the capitol. In 1830 appeared his 'Anna Bolena,' which first, with 'Lucrezia Borgia' and 'Lucia di Lammermoor,' the latter his masterpiece, acquired for him a European fame. In 1835 Donizetti was appointed professor of counterpoint at the Royal College of Naples, but removed in 1840 to Paris, bringing with him three new operas, 'Les Martyrs,' 'La Favorita,' and 'La Fille du Régiment,' of which the last two are among his most popular productions. Of his other operas none except 'Linda di Chamouni' (1842) and 'Don Pasquale' (1843) achieved any special triumph. See Ferris, 'Great Musical Composers' (1887).

Donjon, dūn'jūn or dōn'jōn (Lat. *dominus*, lord, changed to mean master or lord over), the grand or principal or commanding tower or keep of a mediæval castle, frequently raised on an artificial elevation. It was the strongest portion of the building, usually detached from the surrounding buildings. The donjon contained the great hall and principal rooms of state for solemn occasions, and also the prison fortress; from the last is derived the word dungeon.

Donkey. See ASS.

Donkey Engine, a small auxiliary steam-engine in a ship, not used for propelling but to assist in performing various operations where no great power is required. Thus a donkey engine is often stationed on the deck of a ship to work a crane for loading and unloading.

Don'levy, Harriet Farley, American editor and author: b. Claremont, N. H., 18 Feb. 1817. She was educated as a teacher, but abandoned this pursuit and worked in cotton-mills at Lowell. From 1840 to 1848 she edited a mill-girls' magazine, 'The Lowell Offering,' acting as contributor, editor and publisher of the 'New England Offering,' with which she was connected till 1850. She married John Intaglio Donlevy in 1854, who died 1872. Among her works are: 'Shells from the Strand of the Sea of Genius,' reprints from 'Lowell Offering' (1847); 'Happy Hours at Hazel Nook' (1852); 'Christmas Stories'; 'Mind Among the Spindles,' London (1849); also a reprint from the 'Lowell Offering.'

Donne, dōn, John, D.D., English poet and divine; b. London 1573; d. there 31 March 1631. His parents were Roman Catholics, but in his 19th year he abjured that religion, and became secretary to the Lord-chancellor Egerton. He continued in that capacity five years, but finally lost his office by a clandestine marriage with his patron's niece. He subsequently took orders by the desire of King James, and was soon after made one of his chaplains. In 1621 he was appointed dean of St. Paul's. He was chosen prolocutor to the convocation in 1623-4; and, in consequence of a dangerous illness, soon after wrote a religious work, entitled 'Devotions upon Emergent Occasions.' As a poet, and the precursor of Cowley, Donne may be deemed the founder of what Dr. Johnson calls the metaphysical class of poets. Abounding in thought this school generally neglected versification, and that of Donne was peculiarly harsh and unmusical. He wrote Latin verse with much elegance. A collection of his Latin poems was published in 1633. Of his prose works, one of the most remarkable is that entitled, 'Biathanatos,' to prove that suicide is not necessarily sinful, which he never published himself, but which found its way to the press after his death. His style is quaint and pedantic; but he displays sound learning, deep thinking, and originality of manner. Besides the works already mentioned, he wrote the 'Pseudo-Martyr' (1610), letters, sermons, etc. See Gosse, 'Life and Letters of John Donne' (1899); Jessop, 'John Donne' (1897).

Don'nelly, Eleanor Cecilia, American author; b. Philadelphia, Pa., 6 Sept. 1838. She is a sister of Ignatius Donnelly (q.v.). Among her many volumes of verse are: 'Out of Sweet Solitude'; 'Domus Dei'; 'Legend of the Best

Beloved and Other Poems'; 'Crowned with Stars'; 'Hymn of the Sacred Heart'; 'Children of the Golden Sheaf and other Poems.' She has also written several prose works, including 'Life of Father Felix.'

Donnelly, Ignatius, American prose writer: b. Philadelphia, 3 Nov. 1831; d. Minneapolis, Minn., 2 Jan. 1901. He was prominent in Minnesota politics, but was best known as an author. Among his writings are: An 'Essay on the Sonnets of Shakespeare'; 'Atlantis, the Antediluvian World' (1882); and 'Ragnarök' (1883). In 'The Great Cryptogram' he endeavors to prove that Francis Bacon was the author of Shakespeare's plays. His best-known novel is 'Cæsar's Column.'

Donner, Georg Raphael, gā'örg rä'fä-äl dōn'nēr, Austrian sculptor: b. Essling, Austria, 25 May 1692; d. Vienna 15 Feb. 1741. He studied at the Vienna Academy of Architecture, and was employed at the imperial court, and also by Prince Esterhazy. Among his best works are the fountains on the Mehlmarkt, and at the city hall, Vienna, and a statue of Charles VI.

Don'nybrook, Ireland, a village now forming part of Pembroke township, in the county of and two miles southeast of Dublin. It is famous for its fairs, now abolished, which used to attract vast multitudes of persons, and seldom passed off without riot and bloodshed.

Donoghue, John, American sculptor: b. Chicago, Ill., 1857; d. New Haven, Conn., July 1903. He won a first prize over many competitors at the Chicago Fair for a classical group, 'Sophocles Leading the Chorus After the Battle of Salamis.' He designed the 'St. Paul' in the Congressional Library in Washington, the 'St. Louis of France' of the Appellate Division building in New York, and busts of Gov. Ames and John Boyle O'Reilly in the Boston Public Library. Other works were his 'Venus,' and 'Diana,' and best known of all, his 'Egyptian Ibis.'

Don't Worry Circles, associations formed in New York in the winter of 1897-8 from suggestions in 'Don't Worry: The Spiritual Law of Happiness,' published by Theodore F. Seward. The rules given for conquering the habit of worrying are based upon religious faith, common-sense and a spirit of helpfulness. For a time Washington was the centre of the movement.

Do'nus, Pope from 676 to 678. He is known as a patron of architecture, and adorned many of the churches of Rome; he also compelled the archbishop of Ravenna to recognize his authority. Sometimes a Donus II. is recorded as Pope for a short time in 974, but this is recognized as a mistake, due to an error of a copyist.

Doo, George Thomas, English line-engraver: b. Christ Church, Surrey, 6 Jan. 1800; d. Sutton, Surrey, 13 Nov. 1880. He made himself best known by his famous plates of 'Knox Preaching,' after Wilkie; of Eastlake's 'Italian Pilgrims Coming in Sight of Rome'; by his exquisitely finished heads of women and children, after Lawrence; and by his engravings from Raphael, Correggio, and others. His plate of the Calmady Children, titled 'Nature,' after Lawrence, produced in 1830, ranks as his master-

piece. In 1851 he was elected a Fellow of the Royal Society; in 1857 an academician. About 1853-5 he painted in oils, his works of this class being mainly portraits. In 1864 he completed, after eight years' work, a large engraving of the 'Raising of Lazarus,' by Sebastian del Piombo, his last important work.

Dooley, Mr. See DUNNE, FINLEY PETER.

Doolittle, Charles Camp, American soldier: b. Burlington, Vt., 16 March 1832. He entered the volunteer service during the Civil War, becoming colonel in 1862. He led a brigade at Nashville; and was commander of the northern district of Louisiana in 1865. In June, 1865, he was made major-general of volunteers, and was mustered out of service in November of the same year. He moved to Toledo, Ohio, where he was cashier of the Merchants' National Bank.

Doom, the old name for the "Last Judgment," a subject usually chosen for paintings over the chancel arch in parochial churches in England. Dooms were executed in distemper, and are of constant occurrence. In the reign of Edward VI. these representations were effaced, or washed over, as superstitious.

Doom Palm, or **Doum Palm**, a palm-tree, *Hyphane thebaica*, whose branches terminate in a tuft of large fan-shaped leaves. The fruit is about the size of an apple; it has a fibrous mealy rind, which tastes like gingerbread (whence the name gingerbread-tree sometimes applied to this palm), and is eaten by the poorer inhabitants of Upper Egypt, where it grows. An infusion of the rind is also used as a cooling drink in fevers. The seed is horny, and is made into small ornaments. Ropes are made of the fibres of the leaf-stalks.

Doomsday or Domesday Book, the record of a statistical survey of England, made by royal authority in the reign of William the Conqueror. The origin of the name has been much disputed. Popularly it has often been associated with the final day of judgment. There was a doom-book or dom-boc (q.v.) composed in the reign of King Alfred, which contained a collection of the laws and customs of the kingdom; and the doomsday book is conjectured to have taken its name from the fact of its containing the authoritative data on which legal decisions in regard to land and other collateral property were to be given. The general survey of the kingdom was ordered at Christmas 1085, and completed in the following year. It was made by commissioners appointed by the king, who collected the particulars at inquests from a sworn jury, consisting of sheriffs, lords of manors, presbyters, bailiffs, villains; all the classes, in short, interested in the matter. The information collected consisted in specifications of the extent of land in each district, their proprietors, tenure, and value; the state of culture, namely, the quantity of meadow, pasture, wood, and arable land; in some counties the number of tenants, villains, *cotarii* and *servi*; even the sheep and cattle on the different estates were taken, but these were not entered in the permanent record. Northumberland and Durham were omitted, and the northern part of Cumberland and of Westmoreland. The original 'Domesday Book' is preserved in the record office. It consists of

DOON—DOPPLER'S PRINCIPLE

two volumes; one folio, one quarto. The republication of this valuable record was undertaken in 1767 and completed in 1783. Perfect facsimiles of the whole book in photozincography have also been made.

Doon, a river in Ayrshire, Scotland, which after a course of 30 miles flows into the Firth of Clyde. It is celebrated in the poems of Burns.

Door, a wooden or metal, sometimes stone frame or panel constructed to open and shut on hinges; used for entrances to buildings, rooms, etc. Sometimes made of one piece, but generally of several sections framed together. The doors of ancient Egypt and kindred countries swung upon vertical pintles which projected from the top and bottom of the door into sockets above and below. In China and other eastern countries doors may be seen to-day swinging on pivots. In modern carpentry, doors are classified under two general heads: batten-doors and panel-doors. The former are made of two or more boards placed longitudinally and held together by transverse rails. The latter are formed of a skeleton frame work into which is fitted lengths of thin board called panels. Folding and sliding doors have been improvements upon the hinge variety, working on tracks or grooves and having the particular value of economizing space.

Door'ga, in Hindu mythology the principal wife of Siva, one of the gods belonging to the Hindu triad. In Bengal the name Doorga is her appropriate appellation, and was given her by transference from the giant Doorga whom she slew. In southern and western India she is called Purwutee, or Parvati.

Doorn, a common name in South Africa. It indicates various communes in the Cape Colony. It also designates two rivers, in Africa, distinguished as Great and Little Doorn.

Doorn'boom (*Acacia horrida*), a tree common in South Africa. The name "thorn-tree," given to it by the Dutch colonists, and the botanical specific name, are due to the number and sharpness of its spines. It seldom much exceeds 30 feet in height, but its timber is hard and tough, and is much used for house-carpentry, etc. See ACACIA.

Dope (from Dutch *doop*, sauce) is a descriptive term meaning any thick liquid like molasses; a thick sauce or gruel or other viscous fluid or pasty thing used for eating is called a dope. Also a thick pasty lubricant like axle-grease. Fillers used in painting to fill the pores of the wood and prevent the absorption of the paint or varnish subsequently applied to the wood. A preparation of pitch, tallow and other ingredients which, when applied to the bottoms of shoes, will enable the wearer to lightly glide over softened snow. Any absorbent material, as cotton-waste for holding axle-grease or kieselguhr for holding nitro-glycerine. A stupefying substance like opium or chloral hydrate. For dynamite dopes see EXPLOSIVES.

Dop'pler, Christian, Austrian mathematician and physicist: b. Salzburg, Austria, 30 Nov. 1803; d. 17 March 1853. He was professor of mathematics at Prague 1841-7, and at Vienna held a similar post in the Polytechnikum 1848-51. For the last two years of his life he was director of the physical institute at Vienna

University. He published: 'Ueber das farbige Licht der Doppelsterne' (1842); 'Versuch einer systematischen Klassifikation der Farben' (1848); etc., and made known the noted "Doppler's Principle" (q.v.).

Doppler's Principle, a name given to the physical law (first enunciated in 1842 by Christian Doppler of Prague,) that the apparent wave-length of sound or light depends upon the velocities of the observer and of the source from which the radiation proceeds. For the sake of illustration, let the source of the radiation be stationary with respect to the medium that transmits the waves, and let the velocity of the waves in this medium be V . If N is the number of waves of a certain definite wave-length that the source emits every second, then the observer will also receive N of these waves every second, provided he remains stationary. If the observer is moving, however, the case is different. For example, suppose that he is receding from the source of the radiation with a uniform velocity v , and consider what happens in the course of a single second. During this second N waves reach his initial position, just as before; but at the end of the second he is v units of distance beyond that initial position, and hence it is impossible that all of these N waves can have reached him. The deficit will evidently be equal to the number of waves whose combined lengths would just measure v . But the source sends out N waves every second, and when the last of these N is just leaving the source, the first one of the series has proceeded to a distance V . Hence we know that the length

of one wave is $\frac{V}{N}$; and to find the number of

waves that would be required to fill the distance v , we have only to divide v by the length of a single wave; that is, we have to divide it

by $\frac{V}{N}$. Hence the observer's motion will di-

minish the number of waves that reach him

every second by $\frac{Nv}{V}$, and, therefore, when he

is receding from the source with the velocity

v , he will receive only $N - \frac{Nv}{V}$, or $\frac{N(V-v)}{V}$,

waves per second. The result will be, that the wave-length of the sound (or light) will appear to him to be longer than it really is. The same line of reasoning will show that if the observer is stationary and the source is receding with a velocity v , the number of waves that the observer will receive per second will

be $\frac{NV}{V+v}$. If the motion is such as to di-

minish the distance instead of increasing it, the algebraic sign of v must be reversed in the foregoing formulæ. The most familiar example of Doppler's principle is afforded by the sudden change in the apparent pitch of a sounding bell or whistle on an express train moving at high speed. If the observer stands close to the track, the pitch falls suddenly and very markedly, as the locomotive passes him. The most important applications of the principle, however, are in astronomy, in connection with the mea-

surement of the velocities of the celestial bodies, by observing the displacement that their motion produces in the positions of the lines of their spectra. (See SPECTROSCOPE.) If the earth is approaching a heavenly body, the lines in the spectrum of that body are all shifted slightly toward the violet end, owing to the apparent shortening of each wave-length by the motion. If the earth and the heavenly body are receding from each other, there is a similar displacement of the lines toward the red end. The rotation of Saturn's rings has been experimentally demonstrated in this way, and the velocities of approach and recession of many of the brighter fixed stars have also been determined. Certain stars have been demonstrated to be double, by the discovery that the lines of their spectra are periodically double and single; the lines appearing single when the relative motion of the two components is perpendicular to the line of sight, and double when the positions of the component stars are such that one star is approaching the earth while the other is receding from it. The orbits of certain of these stars have been determined by such measurements, even when the components of the systems are so close together that no telescope can show them separately, nor make them appear otherwise than as a single point of light.

Dop'plerite (named after B. Doppler, the first to bring it to notice), an amorphous mineral occurring in elastic or partly jelly-like masses found in peat-beds in Styria and Switzerland, and regarded as a fossil peat. When fresh it is a brownish-black, with a dull brown streak and greasy subvitreous lustre, insoluble in alcohol or ether. Dopplerite is also the name of a related mineral, grayish, earthy, and plastic in the fingers when fresh.

Dor, or Bongo (q.v.), the names given to a mixed tribe of negroes living in Central Africa, in the lowlands of the Bahr-el-Ghazal, eastern Sudan. The race is of medium size, attaining splendid muscular development. Their skin is red-brown. They are noted for remarkable productions in iron and wood work.

Dor, or Dorr, a species of beetle, belonging to the family of earth-borers. It is of a glossy violet, black, or deep greenish-black. The club of the antennæ is yellowish, the elytra smooth, but slightly punctated, as is the thorax. It may often be seen flying about in the summer evenings. Its size and weight render it very unwieldy on the wing, so that it has but little power of guiding itself, and apparently none of checking its course quickly, for it strikes against all kinds of objects, but without suffering any damage. The female lays its eggs in patches of cow-dung. It is about an inch long. It is also called dor- or dorr-beetle, dor-fly, and buzzard-fly.

Dor, or Mont Dore, *môn' dōr* (often written *Mont d'Or*), a chain of mountains in France belonging to the group of the Auvergne Mountains, in the department of Puy-de-Dôme. They are of volcanic formation. The Puy-de-Sancy, the highest peak of central France, is 6,190 feet.

Dora d'Istria, *dō'rā dēs'trē-ā*, pseudonym of ELENA GHICA, Rumanian author: b. Bucharest 22 Jan. 1829; d. Florence, Italy, 20 Nov. 1888. She married the Russian Prince Koizow-

Massalsky. Her first work, 'Monastic Life in the Eastern Church,' alleges monasticism to be the principal obstacle to civilization in eastern and southern Europe. Her other works include: 'German Switzerland'; 'Women in the East'; 'Women, by a Woman.' She contributed many literary and historical essays to German, Italian, French, and Greek periodicals. Her studies on Albanian poetry gave rise to a nationalistic and literary movement among the Albanians. The Greek Chamber of Deputies, in April 1868, named her "high citizeness of Greece."

Doran, John, English essayist and critic: b. London 1807; d. there 28 Jan. 1878. He wrote: 'The Wandering Jew,' when he was 17, and the Surrey theatre staged it. His maturer performances, 'Table Traits and Something on Them' (1854); 'New Pictures and Old Panels' (1859); and a 'History of Court Fools' (1858), have merit.

Dorat, Claude Joseph, *klōd zhō'zēf dō-rā*, French poet: b. Paris 31 Dec. 1734; d. there 29 April 1780. He renounced the study of law, and afterward the military service, into which he had entered as a musketeer, and devoted himself entirely to poetry. He wrote numerous dramas which were unsuccessful. He has succeeded better in songs, tales, and poetical epistles, but though he had great facility in composition, his works are not much esteemed. Dorat's works appeared in Paris complete in 20 volumes (1786).

Dorcas Gazelle, the best known of the genus of gazelles, very common in northern Africa, Asia Minor, Arabia, and Syria. It attains a height of two feet; has tapering ringed horns from 9 to 10 inches long; and is of a tawny color with white under parts. It is noted for its speed, is naturally very wild, but easily becomes domesticated, and owing to its beauty and gracefulness is frequently alluded to in Oriental poetry. Its name is derived from the Greek *δορκάς*, through *δέρκεσθαι*, to look, owing to the size and brightness of its eyes.

Dorcas Society, the name given to an association of ladies who make or provide clothes for needy families, distributing the garments free or at a nominal cost. The name is taken from Acts ix. 39: "And all the widows stood by him weeping, and showing the coats and garments which Dorcas made, while she was with them."

Dor'chester, Daniel, American Methodist clergyman: b. Duxbury, Mass., 11 March 1727. He was educated at Wesleyan University and entered the Methodist ministry in which he has been prominent as pastor and presiding elder. He has been at various times a member of the Connecticut Senate and the Massachusetts House of Representatives, and has published: 'Concessions of Liberalists to Orthodoxy' (1878); 'Problem of Religious Progress' (1881); 'Latest Drink Sophistries versus Total Abstinence' (1883); 'The Liquor Problem in All Ages' (1884); 'The Why of Methodism' (1887); 'Christianity in the United States' (1888).

Dorchester (ancient Roman DURNOVARIA or DURINUM), England, a municipal borough, the county town of Dorsetshire. In March, 1645, Cromwell held the town as his headquarters

DORCHESTER — DORIA

with 4,000 men, and in 1685 Judge Jeffreys held his "bloody assize" here, when 292 received sentence of death as being implicated in Monmouth's Rebellion. A Roman amphitheatre, in a good state of preservation, is near the town.

Dorchester, Mass., since 1870 one of the wards of the city of Boston. Dorchester, originally called Mattapan, was settled in 1630 by the Puritans, but the name was soon changed to Dorchester in memory of the English home of some of the settlers. It was by fortifying Dorchester Heights in March 1776 that Washington forced the evacuation of Boston by the British army. The place is noted as the birth-place of Edward Everett. The population is counted as a part of that of Boston.

Dorchester, New Brunswick, town, county-seat of Westmoreland County; at the junction where two small rivers enter Shepody Bay; and on the Intercolonial R.R. The industries are principally ship-building and nearby quarrying. Pop. (1902) 7,105.

Dorchester Heights, now **South Boston**, Mass. This hill on the peninsula, southeast of Boston proper, across a navigable channel, commands the city; and in the Revolution, when Boston was held by Howe in the winter of 1775-6, it was obviously of the first importance to fortify it. Howe neglected to do so, and on the evening of 4 March 1776, under Washington's orders, Gen. John Thomas, with some 2,500 men and the proper implements, took possession of the heights, and by the next morning a sufficient entrenchment had been thrown up. Howe promptly agreed to evacuate Boston if unmolested, and did so on the 17th, leaving all his guns and supplies unharmed for the Americans.

Dordogne, dōr-dōn-yē, a department of France which includes the greater part of the ancient province of Périgord, and small portions of Limousin, Angoumois, and Saintonge. It lies between Haute-Vienne on the north, Carreze and Lot on the east, Lot-et-Garonne on the south, and Charente, Charente-Inférieure, and Gironde on the west. Area, 3,550 square miles, of which about a third is fit for the plow. The chief minerals are iron, which is abundant, slate, limestone, marble, and other stone. Mining, iron manufacture, etc., are carried on to a considerable extent, and there are a number of vineyards. Also noted for its production of wines and truffles. The climate is mild, but somewhat changeable. Pop. (1901) 452,951. The river Dordogne, principal river of the department, rises on the flanks of the Puy-de-Sancy, flows west-southwest, and after a course of 290 miles unites with the Garonne in forming the Gironde.

Dordogne, a river of France, rising near Mt. Dore and flowing west for 305 miles, uniting with the Garonne about 15 miles north of Bordeaux. The river is navigable for steamers for nearly 190 miles.

Dordrecht, dōr-drēnt. See **DORR**.

Doré, Paul Gustave, pōl gūs-tāv dō-rā, French artist: b. Strasburg 6 Jan. 1833; d. Paris 23 Jan. 1883. In 1845 he was sent to the Lycée Charlemagne at Paris, and three years later his early developed skill as a designer and draughtsman of humorous and satirical subjects gained him a place among the illustrators of the

'Journal pour Rire.' From 1848 to 1853 he contributed to the Salon a series of pen drawings, such as 'Les Pins Sauvages'; 'Le Lendemain des Orages'; 'La Prairie'; etc., which attracted much attention. In 1857 he had honorable mention for landscapes and a picture of the battle of Inkerman. His productivity was extraordinary, and embraced almost all classes of subjects. He is best known in England as the illustrator of the Bible, 'Don Quixote,' and of the works of Dante, Milton, and Tennyson ('Idylls of the Kings'). He also illustrated Rabelais and works by Chateaubriand, Balzac, and other writers. As a painter he was less successful than as an illustrator of books. His works of this class were mostly immense canvases, among them being 'Paolo and Francesca da Rimini' (1863); 'The Neophyte' (1868), and 'Christ's Entry into Jerusalem' (1876).

Doremus, Robert Ogden, American chemist: b. New York 11 Jan. 1824. He was graduated at New York University in 1842, and from its medical department in 1850, having established his chemical laboratory in New York in 1848. He has filled the chair of chemistry at Bellevue Hospital Medical College and at the College of the City of New York. He patented noted chemical processes and fire extinguishers and has been a noted expert in toxicology.

Doremus, Sarah Platt Haines, American philanthropist: b. New York 3 Aug. 1802; d. there 29 Jan. 1877. She was married to Thomas C. Doremus in 1821. With several others she organized the Greek Relief Society in 1828, and with Catharine Sedgwick established in 1842 a Home for Women from Prison, since known as the Isaac T. Hopper Home. She assisted in founding the House and School of Industry and was officially connected with various benevolent institutions, besides working for a half century in behalf of foreign missions. During the Civil War she labored for sick and wounded soldiers, both North and South.

Doria, dō'rē-ā, one of the most powerful families of Genoa. It became distinguished about the beginning of the 12th century, and shared with the families Fieschi, Grimaldi, and Spinola the early government of the republic. These four were known as *Magnæ quatuor prosapie*, the four great families of this republic. The Dorias and the Spinolas belonged to the Ghibelline, the Fieschi and the Grimaldi to the Guelph faction; but as this division does not exhaust the combinations of which the number four is capable, the two distinct sections entertained their own private jealousies and quarreled among themselves, Guelph with Guelph and Ghibelline with Ghibelline, making, as it were, a bear-garden of the dark and deep streets of their formidable city.

Doria, Andrea, ān drā'ā, Genoese admiral: b. Oneglia 30 Nov. 1468; d. Genoa 15 Nov. 1560. He entered the Pope's guards and afterward passed into the service of the Duke of Calabria, who commanded in Italy for the king of Aragon. He was rapidly promoted, and Alphonso II. gave him a command against Ludovico Sforza, Duke of Milan. When the French had left Italy the Genoese entrusted the reconstruction of their fleet to Doria. He was first employed in suppressing the African pirates, from

DORIAN MODE — DORION

whom he captured a large booty, but was soon after exiled, and entered the service of Francis I., who named him admiral of the French galleys. Displeased with some demands of the French king, who in answer to his complaints deposed him from his command, he entered the service of Charles V. in 1528. His defection proved disastrous to the French cause in Italy. He occupied Genoa without resistance on 12 Sept. 1528, and his further successes contributed to the re-establishment of peace. He re-established order in Genoa, and organized the government on a new basis, which became permanent during the independence of the republic. Charles bestowed on him the highest honors, and received in exchange the most important services. In 1532 he took Koron and Patras, in Greece, from the Turks, and in 1535 assisted in the capture of Tunis. He assisted next year in a descent on Provence, took Toulon, and ravaged the coasts of the Gulf of Lyons. The emperor and the king of France had afterward an interview, which has become historical, on board his galley, with a view to the conclusion of peace. This interview took place at Aigues-Mortes in July 1538. In 1547 he narrowly escaped assassination in a conspiracy raised in Genoa by the Fieschi. His nephew was killed in this conspiracy, which excited him to some severities approaching to the barbarity of earlier times. Doria has been accused, probably with justice, of selling his sword too freely, and to too many opposing interests; but his services to his country have earned him the titles of *father* and *liberator*, which were conferred on him, together with the censorship for life, by the Genoese senate in 1528.

Do'rian Mode, the standard Greek and ecclesiastical mode, the first of the authentic church tones or modes, from D to D, with its dominant note of A. It resembles the key of D minor, but with the B natural and no C sharp. It is characterized by its severe and austere progressions, and is especially adapted to religious or warlike music. Many of the old German chorals are written in this mode.

Dorians, one of the four great branches of the Greek nation. They derive their name, according to legend, from Dorus, the son of Hellen. They dwelt first in Histiazotis, were then driven by the Perrhæbi into Macedonia, forced their way into Crete, where the lawgiver Minos sprang from them, built the four Dorian towns (Dorica Tetrapolis) at the foot of Mount Eta, between Thessaly, Ætolia, Locris, and Phocis, and subsequently, together with the Heraclidæ, made a settlement in the Peloponnesus, where they ruled in Sparta. Colonies emigrated from them to Italy, Sicily, and Asia Minor. The Dorians were in many ways the reverse of the Ionians. The Doric manner always retained the antique style, and with it something solid and grave, but at the same time hard and rough. The Doric dialect was broad and rough; the Ionic, delicate and smooth; it was the form made use of in solemn odes, for example, in hymns and in choruses forming part of the national celebrations, and the acting of the drama at Athens. The Cretan and Spartan legislative codes of Minos and Lycurgus were much more rigid than the mild Athenian institutions of Solon. The Spartan women wore the light tucked-up hunting-dress,

while the Ionian females arrayed themselves in long sweeping garments. Both have been idealized by artists: the one in Artemis and her nymphs, the other in Pallas Athene and the Canephora. The same contrast appears no less strikingly in their architecture, in the strong, unadorned Doric, and the slender, elegant Ionian columns. See Müller, 'Die Dorier'; Grote, 'History of Greece.'

Doric Order, in architecture, the second of the five orders, being that between the Tuscan and Ionic.

Grecian Doric.—The Doric column was first adapted to edifices having the proportions, strength, and beauty of the body of a man. The trunks of trees probably suggested the first idea of columns, but in the Doric style the proportions of a man appear to have been adopted. A man was found to be six times the length of his foot, hence the plain Doric columns were made six diameters in height. From the middle of the 7th century to the end of the 6th century B.C., the Doric appears to have been the only style of architecture used by the Greeks, and its highest example is the Parthenon of Athens.

Roman Doric.—An imitation of the Grecian, with a true Greek entablature and a molded base. The column is slenderer than that found in the best Greek examples, and is possibly of Etruscan proportions.

Dorigny, Louis, 100-ē dō-rên-yê, French engraver: b. 1654; d. Verona, Italy, 1742. He with a son of Michael Dorigny (q.v.). He entered the school of Lebrun, and made a journey to Italy, where he copied the great masters.

Dorigny, Michel, mē-shel, French painter and engraver: b. St. Quentin 1617; d. Paris 1665. He was a scholar of Simon Vouet, whose works he etched, and whose faults in drawing he copied. His style of execution is bold, and his management of light and shade good. He became professor in the Academy at Paris.

Dorigny, Sir Nicholas, French engraver: b. Paris 1658; d. 1746. He was a son of Michael Dorigny (q.v.). He spent 28 years in Italy in studying the most illustrious masters, and 8 in engraving the famous cartoons of Raphael, at Hampton Court, for which he received the honor of knighthood from King George I. In 1725 he became a member of the Academy at Paris. One of his best engravings, besides his cartoons is the 'Transfiguration,' from Raphael, and the 'Apotheosis of St. Petronilla,' after Guercino. His engraving is easy and strong, and the work of the needle and the graver happily united.

Do'ron, Sir Antoine Aimé, Canadian jurist: b. St. Anne de la Perade, P. Q., 17 Jan. 1818; d. 3 May 1891. He was called to the bar in 1842 and became chief justice of the Province of Quebec in 1874. He held various cabinet positions and was knighted in 1877. During his

Grecian Doric Capitals. 1, plain; 2, jointed; 3, at temple of Ceres in Paestrum.

political career he was the leader of the French-Canadian Liberal party of the Province of Quebec.

Dor'is, a small mountainous district of ancient Hellas, was the home of the Dorians (q.v.). It is now a part of the modern government of Phocis. Doris was also the name of a district in Asia Minor on the coast of Caria, inhabited by colonists from the Peloponnesus.

Doris, in mythology. See NEREUS.

Doris, in natural history. See SEA-LEMON.

Dor'king, England, town in Surrey, 22 miles southwest of London, noted for its breed of fowls. It is the scene of the fictitious 'Battle of Dorking.'

Dorking, a fowl. See POULTRY.

Dormant Partner, a commercial term, almost obsolete to-day, having given way to the more familiar expression silent partner (q.v.).

Dormant State. See HIBERNATION.

Dormer Window (Old French *dormeor*, a sleeping-room), a vertical window usually flush with the wall of the house and standing in a projection built out to receive it from a sloping roof. In ordinary house-building serves as an ornament and at the same time lighting and enlarging an attic chamber. Very picturesquely used throughout France, Belgium and the Netherlands. In Gothic and Renaissance architecture the dormer window effect was often employed on beautiful stone edifices.

Dormitory (Fr. *dormitoire*, from Lat. *dormire*, "to sleep"), formerly in a monastery or nunnery sleeping quarters either divided into cells or cubicles, opening upon a corridor, or one great apartment divided by partitions or curtains. In connection with American colleges and similar institutions the dormitory is often an entire building divided into bed-rooms.

Dormouse, the common name given to the family *Myoxida*, natives of the Old World. They are pretty little creatures, with soft, fine fur, and long, squirrel-like tails; but, unlike the squirrels, which they somewhat resemble in habits, they have no cheek-pouches. There are in all four genera of the *Myoxida*, containing about a dozen species, the best known of which is the red dormouse, "hazel mouse," or "muscardine" (*Muscardinus avellanarius*), which lives in the woods in most parts of Europe. It is about the size of the common house mouse; has a rather large head, a pointed muzzle, large, prominent eyes, and a hairy tail. It is reddish in color above, and white below. Its food consists of acorns, nuts (especially hazel nuts), and grain; which it stores for winter use, much as squirrels do. In the coldest weeks of winter it curls up and sleeps, waking, however, at intervals, in milder days, to feed upon its gathered stores. Its nest is usually made of tangles of herbage, with an opening at the top, and hidden in the underbrush. The fat dormouse (*Myoxis glis*) is larger than the red dormouse, and duller in coloring. It inhabits the forests of southern Europe, where it may be found leaping with remarkable agility from tree to tree. The garden dormouse (*Eliomys nitela*) lives nearer to man, being found in gardens, and often in barns. It destroys fruit grown along walls and trellises. The French call it "lerot"; the Germans "Gartenschläfer."

Dorner, dôr'nér, Isaak August, German Protestant theologian: b. near Tuttlingen, Württemberg, 20 June 1809; d. Berlin, 8 July 1884. He studied theology and philosophy at Tübingen; and had already filled chairs at Tübingen, Kiel, Königsberg, Bonn, and Göttingen, when in 1861 he was called to be professor at Berlin. His greatest work is the 'History of the Development of the Doctrine of the Person of Christ' (1861-63). Among his other works are 'History of Protestant Theology' (1871); 'System of Christian Doctrine' (1880-4); 'Christian Ethics' (1887).

Dor'nick, a species of coarse, figured linen, named from Tournai or Doornick in Flanders. The manufacture introduced into England by the Dutch who fled from the persecutions of Alva was long confined by law to inhabitants of Norwich and Pulham. A similar cloth called dornock was made at Dornock, Scotland.

Dornoch (dôr'nök) Firth, an arm of the sea, on the east coast of Scotland. The town of Dornoch is near the entrance. Fishing is valuable, but navigation is difficult.

Dornock. See DORNICK.

Dorohoi, dô-rô-hoi, Rumania, a town in the northwest of Moldavia, near the Austrian frontier. Pop. 15,000, half being Jews.

Dorpat, dôr'pät, or Dörpt (Lettish, *Tehr-pät*), Russia, city in the government of Livonia, on the Embach, about 135 miles northeast of Riga. Dorpat is chiefly remarkable for its university, which was founded in 1632 by Gustavus Adolphus, when the Swedes were masters; it was suppressed, in 1656, by the Muscovites; and re-established by the Emperor Alexander, in 1802-3. To this institution is attached an observatory, which the labors of Dr. Struve have made famous, and a library with about 300,000 volumes. Pop. 45,000.

Dorr, Julia Caroline (RIPLEY), American poet and prose writer: b. Charleston, S. C., 13 Feb. 1825. She removed to Vermont in 1830 where she married in 1847 S. M. Dorr, who died in 1884. Among her volumes of verse are: 'Poems' (1871); 'Friar Anselm' (1879); 'Daybreak, an Easter Poem' (1882); 'Afternoon Songs' (1885). Her prose works include: 'Lanmere' (1856); 'Sibyl Huntington' (1860); 'Expiation' (1872); 'Farmingdale' (1854); 'Bermuda,' a volume of travel (1884); 'Bride and Bridegroom, or Letters to a Young Married Couple'; 'The Flower of England's Face' (1895); 'A Cathedral Pilgrimage' (1896); 'Afterglow' (1900); 'In Kings' Houses' (1898).

Dorr, Thomas Wilson, American politician: b. Providence, R. I., 5 Nov. 1805; d. there 27 Dec. 1854. He was a member of the Assembly of Rhode Island in 1833-37, and was the leader of Dorr's Rebellion (q.v.). This was brought about by dissatisfaction with the constitution of the State; and a call for a constitutional convention was made by a party called the Suffrage Party, of which Dorr was the head. A new constitution was made by this convention and submitted to the people in 1841, receiving a majority of the votes. Dorr was convicted of high treason and sentenced to imprisonment for life, but was released under a general amnesty act in 1847, and restored to his civil rights in 1852.

DORR REBELLION — D'ORSAY

Dorr Rebellion, 1840-2. Rhode Island after the Revolution continued under her charter of 1663 for nearly three quarters of a century (see CONSTITUTIONS, STATE), it being already that of a self-governing democracy. But it had two features growingly undemocratic, one of them sure to end in an explosion; the town representation in the legislature was based on 17th-century ratios of importance, since then greatly changed — thus, Newport with some 8,000 people had six members, Providence with 23,000 had four, Smithfield with 9,500 had two; and the suffrage constituted a propertied minority with primogeniture, being restricted to holders of \$134 worth of real estate or \$7 annual renters, and their eldest sons. Of 22,000 to 23,000 taxable polls, only 9,590 were freemen; Providence with above 23,000 inhabitants had 1,610 voters, Woonsocket with some 3,000 had 150, etc. Over \$1,000,000 of personal property in Providence was unrepresented. That city was naturally the focus of discontent; Newport as naturally the champion of the established order.

From 1834 on, when he was first chosen to the legislature, the discontent was voiced by Thomas Wilson Dorr, b. 5 Nov. 1805, a lawyer of a wealthy Whig family, and a Harvard graduate. He formed something like a suffrage party organization; but it dissolved from discouragement in 1838. A convention representing only the landholders meantime threw out with only seven votes a proposition to extend the suffrage, and the Whigs smothered the agitation till after Harrison's election in the fall of 1840. Then Dorr, who had joined the Democrats, organized mass-meetings, and the suffrage became the burning question of the hour during the winter. As the legal organs of relief were packed against them by the very system against which they protested, the disfranchised had no recourse but revolution. On the claim of "natural right," they held a convention in October 1841, drafted a constitution, and called for a popular vote upon it; only their own party voted, but by fictitious lists a vote of some 14,000 was computed, about twice the actual number cast. This being a majority of the legal voters, the suffrage party proclaimed the "People's Constitution" as the lawful régime of the State, 13 Jan. 1842. Meantime the landholders' party had called a legal convention, which met in November, split into angry factions, and adjourned to 14 Feb. 1842. But the proclamation of the revolutionary constitution sobered them down; they drew up one practically as liberal as the other, and for the first time allowed those qualified under it to vote on it. The suffrage party was now offered all it claimed; but it was too much committed to its new principle of mass-rule to recede, and the "Landholders' Constitution" was voted down, 8,689 to 8,013. On 13 April the suffragists held an election under the People's Constitution, at which only their own party voted, and chose Dorr governor, with a legislature and corps of State officers. Of course all these proceedings were legally null, and the "Law and Order Party," as they called themselves, recognized them only as treasonable attempts to overturn the legal government.

At an extra session in March the legislature had made the taking of office under the Dorr government treason, and acting as moderator or clerk at their elections a serious misdemeanor; a law dubbed by the Dorr party the "Algerine

Act." At the regular April elections Samuel W. King was chosen governor; and another extra session empowered him to proclaim martial law, and call on the federal government for the help against domestic insurrection guaranteed by the Constitution. President Tyler replied that help should be furnished when violence had actually supervened, but the government could not interfere on a mere apprehension. On 3 May Dorr and his party marched into Providence, and after debating a forcible occupation of the state-house, began legislative sessions in a disused iron foundry. They sat two days, formally repealed the "Algerine Act," demanded of Gov. King the custody of the State property, notified the federal government of their formation of the legitimate State government, etc., and adjourned to 5 July, but never met again. The regular legislature met at Newport 4 May, and the governor again appealed to the President, receiving the same answer; but the military commanders of the vicinity were ordered to keep in touch with the State authorities. Dorr went to New York and elsewhere for recruits and funds, came back on the 16th, and on the night of the 17th-18th undertook to capture the Providence arsenal, but his own men disabled his cannon and his force melted away — his chief adherents by this time being sick of the farce, when the other party were ready to grant all their demands. Dorr escaped into Connecticut (where the governor refused to give him up on requisition), and prowled around the border for several weeks, getting men and stores together — the former mainly young fellows on a "lark"; finally late in June he crossed the border, and the President decided that the time had come to order United States troops to interfere. On the 26th a crushing force marched against Dorr at Chepachet, R. I., and his men on that and the next day dispersed without waiting the event. Dorr remained in hiding for some weeks, and a reward was offered for him; in October he returned and gave himself up for trial, was convicted of high treason in March 1844, and sentenced to life imprisonment. He was pardoned in 1847, and restored to civil life in 1852. He died 27 Dec. 1854. Meantime, in November 1842, a new convention had been held by the regular authorities, adopted by the people 21-3 Nov. 1842, and became operative in May 1843. The suffrage was practically made universal. The proceedings of the state government were held legal by the United States Supreme Court in *Luther v. Borden*, argued by Webster (see his *Speeches*), and decided by Taney. It must be said for Dorr that but for the menace of civil war the suffrage never would have been extended; after the offer of the "Landholders' Constitution," however, he and his party became inexcusable disturbers of public order, risking bloodshed for the question of the legal theory under which the rights already obtained should be held. The great repository of material on this subject is the House Report of the 28th Congress, 1st session, No. 546; the best single summary is Francis Bowen's in the "North American Review" (1844).

Dorrit, Amy, the "Little Dorrit" of the novel of the same name, by Charles Dickens.

D'Orsay, Alfred Guillaume Gabriel, âl'frâ gë-yôm gâb-rë-ël dôr-sâ, COMTE, French leader of fashion: b. Paris 4 Sept. 1801; d. there

DORSE — DORY

4 Aug. 1852. In 1822 he became acquainted with Lord and Lady Blessington, and renounced his military career for the pleasure of their society. In 1827 he married Lord Blessington's only daughter by a first marriage, but a separation shortly followed, and Lord Blessington having died in 1829, D'Orsay returned to England with Lady Blessington, where they became the centre of a circle distinguished for art, rank, literature, and accomplishments.

Dorse, a small codfish found in the Baltic. Formerly supposed to be a distinct species (*Gadus callarias*), but now believed to be the young of the common codfish.

Dorsetshire, a maritime county of England; area, 632,272 acres. Portland stone is quarried in this county.

Dorsey, Anna Hanson, American poet, novelist, and dramatist: b. Georgetown, D. C., 12 Dec. 1815; d. Washington, D. C., 26 Dec. 1896. Some of her works were reprinted in foreign countries; among them being: 'May Brooke' (1856); and 'Oriental Pearl,' translated into German (1857). Her novels, 'Warp and Woof,' and 'Palms,' were published in 1887.

Dorsey, Ella Loraine, American author: b. Washington, D. C., 2 March 1855. She early devoted herself to journalism, serving for 10 years on the Washington papers and later in several other cities. She began her specialty of Catholic juvenile fiction in 1886. She has written much prose and verse for the magazines, and among her published books are: 'Midshipman Bob'; 'Jet, the War Mule'; 'The José Maria'; 'Saxby's Angels'; and the 'Two Tramps.'

Dorsey, James Owen, American ethnologist: b. Baltimore, Md., 31 Oct. 1848; d. Washington, D. C., 4 Feb. 1895. He was ordained a deacon in the Protestant Episcopal Church, and was engaged in parish work in Maryland from 1873-8. He was then appointed ethnologist to the United States Geological and Geographical Survey of the Rocky Mountains; and after spending some time at the Omaha Reservation in Nebraska, was transferred to the United States Bureau of Ethnology. His chief works are: 'On the Comparative Phonology of Four Siouian (Sioux) Languages' (1883); 'Siouian Folklore and Mythologic Notes' (1884); 'Kansas Mourning and War Customs' (1884); 'Indian Personal Names' (1886).

Dorsey, Sarah Anne, American prose-writer: b. Natchez, Miss., 16 Feb. 1829; d. New Orleans, La., 4 July 1879. She was a linguist and a student of Sanskrit. Included in her writings are: 'Lucia Dare' (1867); 'Panola, a Tale of Louisiana' (1877); 'Atalie'; and 'Agnes Graham.' She was amanuensis to Jefferson Davis in the preparation of his 'Rise and Fall of the Confederate Government.'

Dorsey, Stephen Wallace, American politician: b. Benson, Vt., 28 Feb. 1842. He served in the Federal army during the Civil War, and subsequently removing to Arkansas was active in politics. He was a member of the Republican State and county committees; was elected to the United States Senate in 1873; and was secretary of the Republican National Committee for the campaign of 1880. At the time of the "star route" exposures he was accused of having in-

fluenced legislation in the Senate, was indicted before the grand jury in Washington; but was acquitted on his second trial. After 1880 he withdrew from politics.

Dorste'nia (named after Dr. Dorsten, a German botanist), a genus of plants of the natural order *arlocapaceae*, natives of tropical America. The genus is remarkable for the receptacle in which the numerous small flowers are sunken, the female flowers being the most depressed. The rootstocks of various species are used in the preparation of a medicine, once in much repute against low fevers, and as a mild stimulant and diaphoretic, also as efficacious against snake bites, whence the Spanish name, *contra-jerva*.

Dort, dôrt, or **Dordrecht**, dôr'drênt, Holland, city in the province of South Holland; 10 miles southeast of Rotterdam. An inundation in 1421, in which upward of 70 villages were destroyed and 100,000 people drowned, separated the site on which Dort stands from the mainland. It was founded in 1013. Here, in 1572, the states of Holland, after the revolt from Spain, held their first assembly; and sat from 13 Nov. 1618 to 19 May 1619, the conclave of Protestant divines known as the Synod of Dort, which condemned the doctrines of Arminius as heretical, and affirmed those of Calvin. Dort is the birth-place of the brothers De Witt of Cuyp, and Ary Scheffer; to the last a statue was erected in the market-place in 1862. Pop. (1900) 38,804.

Dort, Synod of, an assembly of Protestant divines convoked at Dort (Dordrecht) in 1618-19. Besides the Dutch and Walloon divines, it included representatives from England, Scotland, Switzerland, and part of Germany. It was chiefly occupied in considering the doctrines of Arminius (see ARMINIANISM). It originated the project of translating the Bible into Dutch, which was executed after 19 years' labor. The translation is known as the 'Dort Bible.'

Dortmund, dôrt'moont, Germany, city in the province of Westphalia, on the Ems, 47 miles north-northeast of Cologne. In 1899 it was connected by canal with the canalized Ems (giving a waterway to Emden on the North Sea), and extensive harbor accommodation has been provided. It owes its recent great and increasing prosperity to its becoming the centre of several important railway systems, to the opening of extensive coal mines in the vicinity, and to the active manufactures of iron, steel, machinery, railway plant, etc. It was once a free imperial and Hanseatic town, and the seat of the chief tribunal of the Vehme. Pop. (1900) 142,418.

Dorus, the eponymous ancestor of the Dorians.

Dory, or **John Dory** (*Zeus faber*), a fish belonging to the family *Zenida*, somewhat allied to the mackerel, and celebrated for the delicacy of its flesh. It has the spinous portions of the dorsal and anal fins separated by a deep emargination from the soft-rayed portion, and has also the base of all the vertical fins, and the carina of the belly anterior to the anal fin, furnished with spines or serratures; color, yellowish-green, with a blackish spot on each side; dorsal and anal fins with furcate spines, and a long filament produced from behind each dorsal spinous

ray. The dory has exceedingly protractile jaws, which enable it to capture small fish, etc., when concealed in the ooze or weeds, after slowly moving upon them in a stealthy, catlike manner. It is found on the coast of England, and on the Atlantic shores of Europe, and in the Mediterranean. A related species (*Zenopsis ocellatus*) has been once taken on our coasts at Provincetown, Mass.

Also a North Atlantic species of rock-fish (q.v.).

Dos Passos, John R., American lawyer: b. Philadelphia 1854. He is of Portuguese descent. He studied law; served in the Federal army during the Civil War, and after practising law in Philadelphia for some time went to New York in 1867, where he was very successful in the criminal branch of practice. Later he became an authority upon banking, corporate and financial law. He has written considerably. Among his published works are: 'A Treatise on the Law of Stock Brokers and Stock Exchanges' (1882); 'The Interstate Commerce Act' (1887); 'Commercial Trusts'; 'The Anglo-Saxon Century' (1903).

Dōseh, dō'sē, an Arabic word meaning "treating" denotes a remarkable ceremony, which, until its suppression in 1884, used to take place in Cairo annually on the feast of the prophet's birth (Moolid), in the third month of the Mohammedan year. A party of dervishes of the Sa'di order, to the number of a hundred or more, lay down on their faces, side by side, with their arms doubled under their foreheads. A dozen more ran along upon their comrades' prostrate backs, beating drums, and shouting "Allah." Then the sheikh, mounted, rode along upon the line of bodies, from whom audible prayers could be heard proceeding. It was in consequence of evidences of considerable injury inflicted by the iron-shod hoofs that the khedive Tewfik suppressed this singular religious rite. See E. W. Lane, 'Modern Egyptians,' xxiv.; Butler, 'Court Life in Egypt.'

Dositheans (from their founder, Dositheus), a sect founded by Dositheus, whose life and labors were in Samaria. The popular belief is that he was the first Christian "heretic." Mosheim, on the contrary, thought that he was not a Christian at all, but a false Messiah, who lived at or about the time of our Lord. He is said to have been very rigid in his Sabbatarianism. His other opinions were partly Samaritan, partly Sadducean.

Dositheus, Jewish heresiarch of the 1st century A.D. He insisted on a painfully rigorous observance of the Sabbath, and died of excessive fasting. There was also a grammarian of this name in the 4th century, who wrote a Latin grammar for Greek boys.

Dosso Dossi, dōs'sō dōs'sē (properly GIOVANNI DI NICOLÒ LUTERO), Italian painter: b. near Mantua 1479; d. Ferrara 1542. His manner approaches to that of Titian, with whom he painted some apartments in the ducal castle. His paintings there represent bacchanals, fauns, satyrs, and nymphs. In other paintings he imitated Raphael. Among eight of Dossi's pictures in Dresden, the 'Dispute of the Four Doctors of the Church' is distinguished as a masterpiece by accurate delineation and peculiar power of coloring, and is entirely

in the style of Titian. His brother, Giovanni Battista (d. 1546) was a less celebrated painter.

Dost, Mohammed Khan, Afghan usurper: b. about 1790; d. 1863. He obtained possession of the throne of Afghanistan after the flight of Mahmud Shah in 1818; ruled with great ability, and although driven from his throne by a British army, was ultimately restored, and later became a steady supporter of British power in the East.

Dostoyevsky, Feodor Mikhailovitch, fā'ō-dōr mī-kāl'ō-vich dōs-tō-yēf'skī, Russian novelist: b. Moscow 11 Nov. 1821; d. St. Petersburg 9 Feb. 1881. After serving as an officer of engineers he devoted himself to literature, but becoming connected with communistic schemes was banished to the mines of Siberia, from which he returned in 1856 to resume his literary activity. His first novel, 'Poor People,' came out in 1846, and an English translation of it appeared in 1894. Among other of his works that have appeared in English are 'Crime and Punishment' (1868), a very powerful work, characterized by masterly psychological analysis and thrilling realism in description; 'Injury and Insult'; 'The Friend of the Family'; 'The Gambler'; 'The Idiot'; 'Prison Life in Siberia.' A complete edition of his works was published (1882-3).

Dotheboys Hall, the school which figures in Dickens' novel, 'Nicholas Nickleby.' It was kept by Squeers (q.v.). The name is a rendering of Do-the-Boys Hall. The effect of the exposure by Dickens of the conditions prevailing in some of the English boys' schools was a complete reformation in their methods and management.

Doto, one of the Nereids.

Dotterel (*Charadrius-* or *Eudromias-morinellus*), a species of plover (q.v.) which breeds in the north of Europe and returns to the south for the winter. It is found all over Europe and northern Asia. The dotterel has always been highly esteemed for the table, but its extermination in Great Britain is more likely to result from the assiduity of the egg collector than of the sportsman, a consummation likely to be hastened from its habit of laying but three eggs, instead of four like most plovers. It likewise differs from all other species of plover in having the sternum fenestrated instead of notched posteriorly, and in the larger size and brighter colors of the female.

Dou, Gerard. See DOW, GERARD.

Douai. See DOUAY.

Douarnenez, doo-ār-nē-nēs or -nēz, France, a port in the department of Finistère, on the Bay of Douarnenez, eight miles northwest of Quimper by rail. It is important for the sardine fishery. Pop. 12,900.

Douay, doo-ā, or Douai, France, city in the department of Nord, on the Scarpe River, 18 miles south of Lille. It is one of the oldest towns in France. Its manufactures and trade are quite important. It is noted for the schools which were established here in the 16th and 17th centuries. English, Scottish, and Irish colleges, and novitiates of English Franciscans and Benedictines were all affiliated with the Douay University. Printing-presses and libraries furnished an opportunity for publishing

books for English Catholics. The university property was confiscated in 1793, in the revolutionary period; students and teachers fled to England, and to this migration the Roman Catholic college at Ushaw, near Durham, owes its origin. The English Benedictines still have an establishment at Douay. The library now in the town contains about 90,000 volumes and many valuable manuscripts. Pop. 32,146. See DOUAY BIBLE.

Douay Bible, the name commonly given to the version of the Vulgate text of the Scriptures made at Rheims in France for the use of English-speaking Catholics. The translators and editors of this version were Dr. William (afterward Cardinal) Allen, Dr. Gregory Martin, Dr. Richard Bristow, and John Reynolds, all of them alumni of Oxford University. The work of translating was done mostly by Dr. Gregory Martin, "a scholar of distinguished attainments both in Greek and Hebrew," says the eminent biblical critic, Dr. Westcott. The New Testament was published at Rheims in 1582 and the Old at Douay in 1609-10, both in quarto. The text has since that time undergone numerous revisions, chiefly for correction of its literary form which was faulty because of the employment of words of Latin origin and unintelligible for readers unacquainted with Latin, instead of the homely English equivalents, for example, "comessations" (revellings), ebriety, impudicity, agnition, coinquination, contristate, donary, exinanite, suasible: all mere Latin words with English terminations. This very serious fault was in revision after revision corrected with greatest thoroughness by Dr. Challoner (q.v.), whose first edition of the revised New Testament was published in 1749 and that of the Old Testament in the following year. Challoner's final revision has itself undergone revision several times since, but only for correction of minor errors and oversights. Despite its very serious defects the original Rhemish translation has elicited from a most competent judge, Dr. Westcott, "History of the English Bible," the praise of great fidelity to the text of the Vulgate. "The Rhemists," he says, "in their scrupulous and even servile adherence to the text of the Vulgate . . . frequently reproduced with force the original order of the Greek, which is preserved in the Latin; and even while many unpleasant roughnesses occur there can be little doubt that this version gained on the whole by the faithfulness with which they endeavored to keep the original form of the sacred writings. . . . The same spirit of anxious fidelity to the letter of their text often led the Rhemists to keep the phrase of the original when others had abandoned it. . . . When the Latin was capable of guiding them the Rhemists seem to have followed out their principles honestly; but whenever it was inadequate or ambiguous, they had the niceties of Greek at their command."

Double Bass or Base, sometimes called contrabass, is the largest and deepest voiced of the viol family. Though seldom used in solo work it is counted one of the foundations of the modern orchestra. Originally it had only three strings, but used to-day with four, from the pitch of the third E below the violin clef. The strings are tuned a fourth apart. It probably derives its name from the fact that it sometimes doubles

the bass given to the 'cello or similar instrument in a score. It first appeared in the 16th century and has been attributed to the inventive genius of Gasparo da Salo.

Double Bassoon, also known as contra-fagotto, stands in the same relation to the oboe family as the double-bass (q.v.) does to the stringed instruments, being the largest and deepest toned. It has a compass of more than three octaves upward from the third C (and even Bb) below middle C; an octave lower than the ordinary bassoon. It has a conical tube over 16 feet in length, but bent up so compactly that it causes no inconvenience to the player. Many great masters of orchestration have written liberally for it, especially Haydn, Beethoven, Spohr, and Mendelssohn.

Double Consciousness, a peculiar mental condition, illustrated by the celebrated story of Dr. Jekyll and Mr. Hyde, which describes a rare type of phenomenon occasionally met with in certain nervous affections. By double consciousness is meant, that at certain times, in the waking consciousness of the individual, certain dominant ideas control and impart to the individual a definite personality, known and recognized as such by his friends and associates, and that, at other times, also in a distinctly conscious state, an entirely different series of ideas may govern the person, making him think, feel, and act in a manner entirely different from that of his former personality. It would seem, from many recent studies concerning this phenomenon, that it is practically always a symptom of a diseased mental state and that one of the personalities, so-called, is distinctly pathological and does not pertain to the ordinary conscious states, but is a symptom of a hysterical or epileptic attack. Hypnotic double consciousness is difficult to write about, inasmuch as a large proportion of the observations made by seemingly reputable observers are plainly fictional; but there remains, over and above such untrustworthy accounts, a certain residue of observations which would tend to show that a true double consciousness might exist in the hypnotic phenomenon. Of course it is understood that in normal life, different phases of feeling come and go, and that all normal people do not feel the same at all times, but there is rarely in normal life the marked distinction between two phases of mental activity, such as is described as characterizing the phenomenon of double consciousness. In certain forms of psychical epilepsy, there is a phenomenon of great interest, the so-called automatic epileptic condition, during which the patient may be absolutely different from his former self. This state in epilepsy may persist for a few moments, a few hours, a few days or even extend for weeks. While in this condition the patient may act in a manner totally foreign to his previous self. It is probably true that the nucleus of the condition known as double consciousness must be found in the study of these automatic states that occur in epilepsy. Trance conditions, cataleptic phenomena, somnambulistic performances, etc., are certainly allied states, a complete judgment on which, however, must be reserved for future study. See Gower, 'Epilepsy'; Löwenfeld, 'Der Hypnotismus'; 'Annales des Sciences Psychiques.'

DOUBLE DRAGON — DOUBLE STARS

Double Dragon, Order of the, a military order of China, established to honor foreigners who had served China in a military capacity. In 1882 it was made to include other foreigners who had rendered service to the nation.

Double Eagle, a United States coin of the value of \$20, the eagle being \$10. The name is a book-word, the popular term being "twenty-dollar gold piece." The piece was authorized by Congress in March 1849, and the first ones were struck in 1850. The name refers to the figure of the eagle upon it. It was one of the coins authorized by the Act of 1873.

Double Flowers are flowers which, usually through cultivation, have their stamens and pistils developed into petals, by which the beauty of the flower may be enhanced, though its reproductive powers are sacrificed. All intermediate stages between stamens and petals can be seen in double-flowered roses and carnations. It is frequently observed that a multiplication of the leaf accompanies the conversion of stamens into

systematic study of these objects was made by Sir William Herschel, who, between the years 1779 and 1784, made extensive catalogues of them, because he thought it likely that they were only optically double, one component being really much more remote than the other, and the apparent duplicity being due to the fact that the two lie almost in the same straight line with us. If that were the case, the earth's orbital motion about the sun might be great enough to make an appreciable variation in the distance or direction of one star from the other, if the system were viewed at different times in the year. After recording the distances between many of these stars, as well as the direction of the line joining the two components, he went over them again to see if any changes could be noted; and in so doing (as his son, Sir John Herschel has recorded) "his attention was altogether diverted from the original object of the inquiry by phenomena of a very unexpected character, which at once engrossed his whole attention." Instead

of finding an annual and alternate increase and decrease of the distance, and a corresponding periodic variation in their direction, he saw that in many cases there was a continuous change in both, advancing steadily in one direction. If this were due to the fact that the solar system and the two components of the double star were moving independently through space, we should expect the motion of either of the components, relatively to the other one, to be sensibly rectilinear. After the lapse of 25 years Herschel became satisfied that this is not always

petals; so that a single stamen may be represented by two or more petal-like leaves. Double flowers remain fresh two, three, even eight days longer than similar normal single flowers.

Double Standard, in economics the phrase double standard is used to signify a double standard of monetary value fixed by legislative enactment. It implies the existence of what is known as the gold standard on the one hand, and the silver standard on the other. Wherever the double standard in its integrity is in use a creditor is bound to accept payment of any sum in coins of either of the metals, gold or silver, which the debtor may choose to tender. See **BIMETALLISM**.

Double Stars are stars which, while they may appear single to the eye, are known, by telescopic observation, to consist of two constituents that are near enough together to justify the assumption of a physical connection. About 10,000 such stars are known. The first

case, for in some instances he found good evidence of actual orbital motion, and in 1802 he announced that "there exist sidereal systems, composed of two stars revolving about each other in regular orbits," in the same manner that the earth revolves about the sun, or the moon about the earth. About the year 1819 William Struve took up the systematic study of these stellar systems, and made a long series of most excellent measures of them covering a period of many years. Subsequently the work was taken up by other skilled observers, and we now have a vast mass of data of this sort, from which fairly good orbits of some of the systems have been obtained. The most comprehensive book on the subject is Crossley, Gledhill and Wilson's 'Handbook of Double Stars,' which is a treasury of numerical data and references, and also contains methods for computing the orbits of double stars, as well as advice concerning the making of observations. The star known to astronomers as "70 Ophiuchi" may be cited as

an example of a binary whose orbit has been determined with some degree of approximation. In reality, both of the components of a double star are in motion, each revolving about the common centre of gravity of the two; but it is known that in a system composed of two bodies revolving about each other no error is committed, so far as the relative motion of the two is concerned, by regarding one of them as fixed, and assuming that the other revolves about it. It is customary, therefore, to regard the brighter component of such a star as fixed. In the case of 70 Ophiuchi one star is of about the fourth magnitude, while the other is of about the sixth. In the diagram the large black spot at the intersection of the two straight lines represents the larger star, the straight lines themselves representing, respectively, a meridian and a declination-circle passing through it. The dotted ellipse represents the apparent orbit of the component star, as computed by Risteen from all the available data up to the year 1895. The large dots that appear irregularly along the ellipse, being sometimes within it and sometimes without, represent the observed positions of the companion star, for every five years; and the corresponding smaller dots that lie exactly upon the ellipse represent the corresponding positions of the component, as calculated from Risteen's orbit. (The orbit itself is based upon observations taken each year; but the observations intermediate to those shown have been omitted from the diagram in the interest of clearness.) According to the computation here cited, the period of revolution of 70 Ophiuchi is 88.42 years. In addition to the stars that are visibly double when viewed through the telescope, numerous stars are now known which have been proved to be double by means of spectroscopic observations. (See DOPPLER'S PRINCIPLE.) The periods of revolution of some of these are exceedingly short. Thus, one of the components of the telescopically double star Kappa Pegasi is itself a spectroscopic binary with a period of only six days.

Doubleday, Abner, American military officer: b. Ballston Spa, N. Y., 26 June 1819; d. Mendham, N. J., 26 Jan. 1893. He was graduated at the United States Military Academy in 1842, rising to the rank of colonel in 1870 (brevet lieutenant-colonel in 1865). He was second in command at Fort Sumter in 1861, firing the first gun in its defense, and he greatly distinguished himself at Gettysburg. He published: 'Reminiscences of Forts Sumter and Moultrie in 1860-1' (1876); 'Chancellorsville and Gettysburg' (1882).

Doubleday, Neltje Blanchan, American author: b. Chicago 23 Oct. 1865. She was married to F. N. Doubleday in 1886. She has published: 'The Piegan Indians' (1894); 'Bird Neighbors' (1897); 'Birds that Hunt and are Hunted' (1898); 'Nature's Garden: Our Wild Flowers and Their Insect Visitors' (1900).

Doubleday, Russel, American author: b. Brooklyn 26 May 1872. He was educated in private schools, and served in the United States navy during the Spanish-American war 1898. He has written: 'A Gunner Aboard the Yankee'; 'Cattle Ranch to College.'

Doublet, a close-fitting garment, covering the body from the neck to a little below the waist. It received its name from being originally

lined or wadded for protection. At first it had short shirts, but these diminished as the body of the garment became fuller and more elaborate under the reign of Queen Elizabeth. During the period of Charles I. and after Charles II. it lost all pretense and dwindled into a sleeveless jacket, the forerunner of our modern waistcoat. Originally was introduced from France into England in the 14th century.

In lapidary work, a counterfeit stone composed of two pieces of crystal, with a color between them, so that they have the same appearance as if the whole substance of the crystal were colored. Again accomplished another way by taking a thin layer of a precious gem and fastening it on the line of the girdle to a piece of glass colored to match. Some invisible cement is employed for the purpose, such as gum mastic.

Doubling the Cube, a celebrated problem among the ancient Greek geometers. According to legend the problem originated in an oracle of Apollo delivered to the people of Delos, and hence it has been called the Delian problem. The altar of Apollo at Delos was a cube, and once when they had offended him he ordered that the size of it should be doubled. This was easily done, but had no effect in mitigating the pestilence, which was the usual consequence of Apollo's wrath. On applying to him again the reply was that they must not change the shape of the altar. Hence arose the problem to find the exact size of the side of a cube the contents of which should be twice that of another given cube. The problem, however, was not invented by Apollo, he had only cunningly taken advantage of a problem which had already occupied Hippocrates of Chios and other Greek geometers. This problem the Greek geometers failed to solve, although their efforts to do so proved useful in advancing the study of geometry. It is indeed incapable of arithmetical solution, as will be made clear by merely examining the cubes of the first few numbers consecutively.

The cubes of the numbers from 1 to 9 are:

1	2	3	4	5	6	7	8	9
1	8	27	64	125	216	343	512	729

Here it is evident that taking any given arithmetical unit, it is impossible to find a number depending on it of which the cube will be double that of the cube of any other number depending on the same unit. If, for example, the side of Apollo's altar measured 3 feet, the cubic content of the doubled altar would have to be 54 feet; but it is clear that no whole number will give 54 as its cubic, and as no fraction multiplied by itself will give a whole number, the exact dimensions of the side of this doubled altar cannot be given either in whole feet or in any finite fraction of a foot. This does not prove, however, that a cube of this size cannot exist, but only that between its side and that of a cube whose side is three feet no definite arithmetical ratio can be fixed.

Doubloon, düb-loon', a gold coin of Spain, equal in value to two pistoles. It was worth 1730 to 1772 about \$8.24, from 1772 to 1786, \$8.08, and from 1786 to 1848, \$7.87. Although the coinage of the doubloon has ceased in Spain, coins still current are valued at \$5.02.

Doubs, doo, France, (1) a department which is traversed by four chains of the Jura. Pop.

DOUBTING CASTLE — DOUGLAS

305,193. (2) Doubs, a river 250 miles in length, rises in this department.

Doubling Castle, the castle in 'Pilgrim's Progress,' where Christian and his companion Hopeful are imprisoned for a time by Giant Despair.

Doubling Insanity. See **INSANITY**.

Douc, dook, a species of small monkey (*Semnopithecus nemæus*), native to Cochinchina. It is curiously marked with red, white, and black.

Doucet, Charles Camille, shārl kâ mēl doo-sā, French dramatist: b. Paris 16 May 1812; d. there 1 April 1895. He became in 1853 a government official in the theatrical department; was elected to the Academy in 1876, and soon after made its standing secretary. The best known of his many very successful comedies are: 'A Young Man' (1841); 'Lawyer in His Own Cause' (1842); 'Forbidden Fruit' (1857); 'Consideration.' His lyric pieces for the stage, 'Velasquez' (1847), and 'Antonio's Barque' (1849), were crowned by the Academy.

Doucet, Henri Lucien, ōh-rē lū-sē-ōh, French painter: b. Paris 23 Aug. 1856. He was a pupil of Lefebvre and Boulanger; and won the Prix de Rome in 1880. Among his paintings are: 'Adam and Eve'; 'Atala'; 'Après le Bal'; 'Hagar'; and a number of portraits, including one of Mme. Galli Marie of the Opéra Comique.

Doudney, Sarah, English novelist: b. Portsmouth 15 Jan. 1843. She began writing when quite young and has published: 'A Woman's Glory' (1885); 'The Missing Rubies' (1886); 'When We Two Parted' (1887); 'Strangers Yet'; 'Stepping Stones'; 'The Strength of Her Youth'; 'Thy Heart's Desire'; 'Where Two Ways Meet'; 'Under False Colours'; 'Nothing but Leaves'; 'Miss Willowburn's Offer'; 'Where the Dew Falls in London' (1890); 'Through Pain to Peace' (1892); 'A Romance of Lincoln's Inn' (1894); 'Katherine's Keys' (1895); 'Pilgrims of the Night' (1896); 'A Cluster of Roses'; 'Lady Dye's Reparation' (1899); 'Silent Strings' (1900); 'Godiva Durlough'; 'Child of the Precinct.'

Dougall, Lily, Canadian novelist: b. Montreal, Canada, 16 April 1858. She has published: 'Beggars All' (1891); 'What Necessity Knows' (1893); 'The Mermaid' (1895); 'The Madonna of a Day' (1896); 'A Dozen Ways of Love' (1897); 'The Mormon Prophet' (1898).

Dough'bird, a name given to several species of curlew (q.v.), but more especially to the Eskimo curlew (*Numenius borealis*).

Doughface, a nickname applied to northern politicians who were inclined to yield to the southern States in the antebellum agitation over States' rights and slavery. The term is traced back to 1820, when it was applied to the Northerners who supported the Missouri Compromise (q.v.).

Doughty, Thomas, American landscape painter: b. Philadelphia 19 July 1793; d. New York 24 July 1856. He was apprenticed in his youth to a leather manufacturer, and afterward carried on the business on his own account. A growing taste for art, however, induced him

to become a painter. He practised his profession for many years in the United States, and also in London and Paris.

Douglas, Scottish noble family. Their origin is unknown. They were already territorial magnates at the time when Bruce and Baliol were competitors for the crown, and like most of the Scottish nobility did homage and took oaths of allegiance to Edward I. They had estates both in England and Scotland, but chiefly in Scotland. One of them, William Douglas, joined Wallace. As their estates lay on the borders they early became guardians of the kingdom against the encroachments of the English, particularly of the Percies, who occupied a similar position on the English border, and acquired in this way power, habits, and experience which frequently made them formidable to the crown. The most important members of this family in chronological succession are:

JAMES, son of the William Douglas who had been a companion of Wallace, and is commonly known as the Good Sir James, early joined Bruce, and was one of his chief supporters throughout his career, and one of the most distinguished leaders at the battle of Bannockburn. He fell in battle with the Moors while on his way to the Holy Land with the heart of his master, in 1331.

ARCHIBALD, youngest brother of Sir James, succeeded to the regency of Scotland in the infancy of David. He was defeated and killed at Halidon Hill by Edward III. in 1333.

WILLIAM, son of the preceding, was created first earl in 1357. He recovered Douglasdale from the English, and was frequently engaged in wars with them. He fought at the battle of Poitiers. He died in 1384.

JAMES, the second earl, who, like his ancestors, was constantly engaged in border warfare, was killed at the battle of Otterburn in 1388. After his death the earldom passed to an illegitimate son of the Good Sir James, Archibald the Grim, Lord of Galloway.

ARCHIBALD, son of Archibald the Grim and fourth earl, was the Douglas who was defeated and taken prisoner by Percy (Hotspur) at Homildon, 14 Sept. 1402. He was also taken prisoner at Shrewsbury, 23 July 1403, and did not recover his liberty till 1407. He was killed at the battle of Verneuil, in Normandy, in 1427. Charles VII. created him Duke of Touraine, which title descended to his successors.

WILLIAM, sixth earl, b. 1422, together with his only brother, David, was assassinated by Crichton and Livingstone at a banquet to which he had been invited in the name of the king, in Edinburgh Castle, 24 Nov. 1440. Jealousy of the great power which the Douglasses had acquired from their possessions in Scotland and France was the cause of this deed.

WILLIAM, the eighth earl, a descendant of the third earl, restored the power of the Douglasses by a marriage with his cousin, heiress of another branch of the family; was appointed lord-lieutenant of the kingdom, and defeated the English at Sark. Latterly having entered into a treasonous league, he was invited by James II. to Stirling and there murdered by the king's own hand, 22 Feb. 1452.

JAMES, the ninth and last earl, brother of the preceding, took up arms with his allies to avenge his death, but was finally driven to England,

DOUGLAS

where he continued an exile for nearly 30 years. Having entered Scotland on a raid in 1484 he was taken prisoner and confined in the abbey of Lindores, where he died in 1488. His estates, which had been forfeited in 1455, were bestowed on the fourth Earl of Angus, the "Red Douglas," the representative of a younger branch of the Douglas family, which continued to flourish long after. The fifth Earl of Angus, Archibald Douglas, was the celebrated "Bell-the-Cat," one of whose sons was Gawin Douglas, the poet. He died in a monastery in 1514. Archibald, the sixth earl, married Queen Margaret, widow of James IV., attained the dignity of regent of the kingdom, and after various vicissitudes of fortune, having at one time been attainted and forced to flee from the kingdom, died about 1560. He left no son, and the title of Earl of Angus passed to his nephew, David. James Douglas, brother of David, married the heiress of the Earl of Morton, which title he received on the death of his father-in-law. His nephew, Archibald, eighth Earl of Angus and Earl of Morton, died childless, and the earldom of Angus then passed to Sir William Douglas of Glenbervie, his cousin, whose son William was raised to the rank of Marquis of Douglas. Archibald, the great-grandson of William, was raised in 1703 to the dignity of Duke of Douglas, but died unmarried in 1761, when the ducal title became extinct, and the marquise passed to the Duke of Hamilton, the descendant of a younger son of the first marquis. The line of Angus or the Red Douglas is now represented by the houses of Hamilton and Home, who both claim the title of Earl of Angus.

Douglas, Alice May, American writer for young people: b. Bath, Maine, 28 June 1865. Her writings include in verse: 'Phlox'; 'May Flowers'; 'Gems Without Polish'; in prose: 'Jewel Gatherers'; 'The Peacemaker'; and 'Self-Exiled from Russia,' etc.

Douglas, Amanda Minnie, American author: b. in New York 14 July 1837. She has written about 30 novels besides doing other literary work. Among her novels are: 'In Trust'; 'Claudia'; 'Stephen Dane'; 'From Hand to Mouth'; 'Out of the Wreck'; 'A Woman's Inheritance'; 'Osborne of Arrochar' (1883); 'Her Place in the World' (1894). She has also written several juvenile tales.

Douglas, David, Scottish botanist: b. Scone, Perthshire, 1798; d. Hawaii 12 July 1834. In the botanical garden at Glasgow, he attracted the notice of Sir William Hooker, the professor of botany, who recommended him as a botanical collector to the Horticultural Society of London. He was accordingly, in 1823, sent by the society to the United States, where he procured many fine plants, and in particular increased the society's collection of fruit-trees. In 1824 he was sent on a second mission to explore the vegetation of the country adjoining the Columbia River, and southward toward California. In making the voyage he never lost sight of his object, and was able, during the short time the vessel touched at Rio Janeiro, to collect many rare orchidaceous plants and bulbs. He arrived at Fort Vancouver in 1825, and sent home, from time to time, many beautiful plants, with seeds and dried specimens. A species of pine of gigantic size, one of several which he discovered, bears his name, *Pinus Douglasii*.

Douglas, Gawin, Scottish poet: b. Brechin about 1474; d. London 1522. He was the son of Archibald, earl of Angus ("Bell-the-Cat"). Having taken orders in the church, he received the living of Prestonkirk, near Dunbar, and was also made provost of St. Giles, Edinburgh. In 1516 he was installed Bishop of Dunkeld, but had an uneasy tenure of office; and having gone to England, was deprived of his bishopric. Gawin Douglas' great work is a translation of the *Æneid* of Virgil (with the supplementary book of Maphæus) in heroic verse. It is executed with great spirit, and considering the age, with extraordinary elegance of diction. It was written about 1512, and is said to have been completed in 18 months. To each book is prefixed a highly poetical prologue. It was first published in 1553. Douglas also wrote 'The Palace of Honor' and 'King Hart,' both allegorical poems. A complete edition of his poems was published 1874.

Douglas, Henry Kyd, American author and jurist: b. Shepherdstown, W. Va., 29 Sept. 1840; d. Hagerstown, Md., 18 Dec. 1903. He was graduated at Franklin and Marshall College (1859), at the time when James Buchanan, afterward President of the United States, was a member of the faculty. He enlisted at Harper's Ferry in the Confederate Army as a private in Company B of the noted "Stonewall" Jackson Brigade. He took part in the battle of Bull Run, and for his bravery was promoted until he rose to be a captain. In March 1862 he made a ride of 103 miles in order that Gen. Ewell might at once join Jackson. This ride became celebrated in history. Horses were changed five times, and the ride was made through rain and mud. On his return he was promoted to inspector-general by Stonewall Jackson, with whom he served in every battle. At Gettysburg he was seriously wounded and was in prison nine months. His brigade was the last to surrender. Douglas was wounded nine times.

Douglas, John, English prelate: b. Pittenweem, Fifeshire, Scotland, 14 July 1721; d. Salisbury, England, 18 May 1807. He was educated at Oxford and in 1762 he was made Canon of Windsor, which benefice he exchanged for a residentiary canonry of St. Paul's. In 1751 he wrote 'Milton Vindicated from the Charge of Plagiarism.' In 1777 he prepared for the press the journal of Captain Cook's second voyage, to which he prefixed a well-written introduction, and added notes. In 1778 he was elected a Fellow of the Royal and Antiquarian Societies; and in 1781 he edited the account of Capt. Cook's third voyage. In 1787 he was raised to the see of Carlisle, and in 1792 was made Bishop of Salisbury.

Douglas, Robert Kennaway, English librarian and educator: b. Ottery Sainte Mary, Devon, 23 Oct. 1838. In 1873 became professor of Chinese at King's College, London. Among his publications are: 'Life of Li Hung Chang' (1895); 'China' (1899).

Douglas, Stephen Arnold, American politician: b. Brandon, Vt., 23 April 1813; d. Chicago, 11 June 1861. His father, a physician, died three months after his birth, and his mother was left with scanty means of support. At the age of 15 he apprenticed himself to a cabinet-maker and worked for two years at the latter's trade. Then, after a short term of study at the

DOUGLAS

Brandon Academy, he accompanied his mother, who had married again, to a new home, near Canandaigua, N. Y., where he finished his schooling at an excellent academy, and where he began the study of law. He was interested deeply in political questions, even in these years, attaching himself with ardor to the new party of Democracy which Gen. Jackson was then molding into form. In 1833 he left Canandaigua to seek a career in the West, and, after several months of ill-health and hardship, found employment for the winter in school-teaching at Winchester, Ill. In the spring of 1834 he was admitted to the Illinois bar and settled himself at Jacksonville, in that State. From that time his rapid rise to prominence was extraordinary, even among careers of ambition in the young West. Physically delicate and short in stature, his small body was so strikingly in contrast with the power massed in a big brain and exercised by an indomitable will that admiring Jacksonville promptly gave him the name of the "Little Giant," which clung to him through life. Almost at once he became the acknowledged leader of his party in the town. A winning personality, an elastic temper, a fearless and ardent spirit, unbounded self-confidence and surpassing energy of intellect and will, were qualities that carried him always to the place of command. Within a year from his settlement at Jacksonville he was prosecuting attorney for his district; within two years he was seated in the legislature of the State; and from his service of a session in that body he passed into the office of United States Register of Public Lands, at Springfield, to which he was appointed by President Van Buren in 1837. His residence was at Springfield for the next 10 years, and there he came to acquaintance with Abraham Lincoln, his great political antagonist of a later time, whose rise to eminence was much slower than his own. In 1838 the bold young Jacksonian very nearly won an election to Congress in the strongly Whig district to which Springfield belonged. In 1841 he was appointed to a judgeship in the supreme court of the State, but resigned his seat on the bench two years later, to present himself again as a candidate for Congress, and with success. At that time (1843) he had just passed his thirtieth year. Most newcomers in Congress, even the ablest, need time to make a position of influence for themselves; but Douglas was prominent among the Democratic representatives of the Northwest from the first. The vigorous activity of his mind and the remarkable quickness of its working, made him formidable in debate; while the unhesitating resoluteness with which he threw himself into whatever he undertook carried him always to the front of the fighting line. At the beginning of his second term in the House of Representatives he was made chairman of its Committee on Territories; and when, at the end of that term, he was elected to the Senate (1845), he received the chairmanship of the same committee in that body. This gave him the direction of subjects in legislation which events were making more important and more exciting than any others in the politics of the time. Texas had just been annexed; the country was on the eve of a war of conquest with Mexico, and Great Britain was negotiating a fair settlement of the Oregon dispute. Should an expansion of national territory mean expansion of slavery,

and, if so, to what extent? were the questions now rising in angry debate. They were brought into Congress by the famous resolution called the "Wilmot proviso," which declared that no slaves should be held in any territory acquired as the result of the Mexican War. Extremists on the pro-slavery side set up the opposing doctrine that slave-holding was a constitutional right in any territory, since slaves were a species of property recognized by the Constitution of the United States. A second ground of opposition to the Wilmot proviso was discovered, apparently first by Gen. Cass, who contended that the inhabitants of each territory should admit or exclude slavery as they pleased, by their own votes. This doctrine of "popular sovereignty," or "squatter sovereignty," as it was branded scornfully by Calhoun, commended itself to Douglas' mind. His attitude toward slavery was that of indifference to the right or wrong of the system, which he regarded confessedly as a problem in politics, and no more. Practically, the "squatter sovereignty" doctrine triumphed in the compromise measures of 1850, which admitted California to the Union under the free-state constitution that her people had framed, and organized New Mexico and Utah as territories with no restriction concerning slavery. Excepting Henry Clay, no one did more than Douglas in the framing of those measures and carrying them through. He was now so conspicuous among the chiefs of the Democratic party that he could aspire to its nomination for President in 1852. From the North he received strong support; but the less known and more pliant Franklin Pierce was preferred at the South. Douglas, not yet forty years of age, could afford to wait. At some time within the next two years he conceived his project for a more complete and final settlement of the slavery question than the compromise of 1850 had brought about. This, in his view, could be accomplished by a frank and full adoption of the principle of "popular sovereignty," applied to the whole national domain. Accordingly, in 1854, he startled the country by reporting from his committee what was known in its final form as the Kansas-Nebraska Bill, repealing the Missouri Compromise of 1820 (which excluded slavery from the territory of the Louisiana Purchase, north of 36° 30') and leaving "the inhabitants thereof perfectly free to form and regulate their domestic institutions in their own way." At the North the bill raised a storm which even the bold spirit of Douglas must have watched with alarm. His own party was torn by it; that of the Whigs had already gone to pieces, and two new parties, "Know Nothing" or American, and Republican, now emerged from what seemed to be a general wreck of all in politics that belonged to the past. But Douglas, with no sign of faltering, fought a wonderful battle for his bill and carried it through. Then came the test in practice of his policy, applied in a struggle between anti-slavery and pro-slavery forces to control the settlement and the constitution-making of Kansas. The test was not favorable to the prestige of Douglas. He had heated instead of cooling the agitation of the slavery question, and made it more dangerous than before. As a candidate for the presidency he was hardly so strong in 1856 as in 1852; but after Buchanan, then elected, had driven Douglas to revolt, by countenancing the

fraud of the Lecompton Constitution, making a farce of "popular sovereignty" in Kansas, the manly course of the Illinois Senator gave him more of popularity in the free States than he lost in the South. The hostility of the administration, combining with the opposition of the new Republican party, already powerful in the Northwest, could not defeat his re-election to the Senate in 1858. Over any antagonist but Lincoln he would probably have won a great triumph; as it was, he came wounded from his debates with that extraordinary man. He had been forced to declarations that offended his party in one section of the country more than they satisfied it in the other, and made him the occasion of a hopeless breach between the two. Nominated, for President, at last, in 1860, by one wing of a divided party, he fought his last political battle, with all of his old obstinate valor, and went down in defeat. He was at the end of the small gift of bodily strength that he received at his birth; he had worn it out. He survived the election of Lincoln only long enough to stretch a loyal and supporting hand to his successful rival, in the crisis of rebellion that ensued. His last words to his followers were: "There can be no neutrals in this war."

J. N. LARNED,

Author of the History for Ready Reference.

Douglas, Sir William Fettes, Scottish painter: b. Edinburgh 29 March 1822; d. 20 July 1891. As a painter he was mainly self-taught. On first devoting himself to art he practised chiefly as a landscape painter, but he soon turned to figure subjects, producing 'Hudibras and Ralph visiting the Astrologer' (1856); 'Lovel and the Antiquary' (1857); 'The Summons to the Secret Tribunal' (1860); and 'The Magic Mirror' (1872); works distinguished by excellent coloring, and by especially firm, careful, and refined handling. His later years were entirely devoted to landscape water-colors. He is represented in the National Gallery of Scotland by 'The Messenger of Evil Tidings'; 'The Spell'; and 'The Bibliophilist.'

Douglas, England, capital of the Isle of Man, and a popular summer resort. Pop. 20,305.

Douglas Fir. See **FIR**.

Douglass, Andrew Ellicott, American archaeologist: b. West Point, N. Y., 18 Nov. 1819; d. New York 30 Sept. 1901. He was graduated at Kenyon College in 1838, and after a business career of many years with the Hazard Powder Company, of which he became the president in 1867, he retired in 1876, and spent 10 winters on the coast of Florida, excavating Indian mounds, and collecting specimens of archaeological interest to the number of 22,000, which may be seen in the American Museum of Natural History, New York. He is a member of many scientific societies, including the Société d'Anthropologie of Paris.

Douglass, David Bates, American civil and military engineer: b. Pompton, N. J., 21 March 1790; d. Geneva, N. Y., 9 Oct. 1849. He was graduated from Yale in 1813 and served in the engineer corps of 1813-31. He was one of the engineers of the Croton Aqueduct (1833-35), president of Kenyon College (1840-44), and professor of mathematics in Hobart College the last year of his life.

Douglass, Frederick, American lecturer and journalist, the son of a negro slave: b. Tuckahoe, Md., Feb. 1817; d. Washington, D. C., 20 Feb. 1895. Although his father was a white man, he was, according to the law, reared as a slave. In 1832 he was purchased by a Baltimore shipbuilder, but made his escape in 1838. As he had taught himself to read and write, and showed talent as an orator, he was employed by the Anti-Slavery Society as one of their lecturers. In 1845 he published his 'Autobiography,' and afterward made a successful lecturing tour in England. In 1870 he started a journal entitled 'The New National Era'; in 1871 he was appointed secretary of the commission to Santo Domingo; in 1872, presidential elector; in 1877, marshal for the District of Columbia, then commissioner of deeds for that district, and in 1889, United States minister to Haiti.

Doukhobors, doo'ho-bōrz (Russian *dukhobortsy*, "spirit wrestlers," from their vanquishing the doctrine of the Holy Spirit), a sect which started in Kharkov, Russia, about 1740, and spread rapidly in the Dnieper provinces. The founder's name is not preserved: he was a Prussian sub-officer who settled in Russia when his term expired. He and his successors, Kolesnikoff, Kapustin, etc., taught the familiar doctrine of the "inner light" with logical but socially inconvenient extensions: that as God in the soul is the one guide to action, the Bible is not inspired (though they accept the Ten Commandments), and it is not only superfluous but sinful to read and write, printing being a snare of the Devil; that God manifests himself in the fullest power in the human soul, and as they had that power, they were embodiments of God, and to be worshipped and obeyed as such; that Christ was only a sinless man, and the sinless leaders were his equals and successors. Every one's action being dictated by God, it cannot be wrong, and civil rulers are needless and their rule a usurpation; all being equal before God, churches are needless and they do not enter them; marriages need neither ceremonies nor permission, being of inclination only. It is easy to see that these tenets brought them in conflict with the authorities, who tried to restrict them to theory instead of practice, and imprisoned numbers for contumacy; but in 1801 a commissioner's report to Alexander I. that they were well-behaved citizens induced him to order them left alone. It worked so ill, from insubordination and social evils, that in 1819 the same Czar again authorized the sharpest punishments. At length, on their petition for a grant of waste lands where they could live their chosen life undisturbed and undisturbed, they were settled on the fertile banks of the Molochnaya, on the north shore of the Sea of Azov. Thus left alone, the leaders and their satellites embarked on a carnival of lust, avarice, and despotism; no woman nor piece of property was safe from them, nor any man's life who protested (a minutely exact parallel to an American case in similar conditions), and bands of marauders went about stealing whatever their employers liked. The report of an imperial commission was so shocking that in 1833-7 they were deported to the then wilderness of Transcaucasia; a high bleak plateau unfit for agriculture, where they became almost wholly cattle-raisers and -eaters, and increased to some

DOULTON—DOVE

15,000. The government gradually put down the civil despotism of the leaders, and enforced decency of life: but it was not done without much petty tyranny, and doubtless corruption and abuse, of which they complained. Then came Pobiedonostseff's policy of unifying the elements of the empire, and enforcing conformity to the Greek Church; and in 1887 a bitter faction fight between two pretenders to the Doukhobor leadership rent the community. One section decided to emigrate to be rid of it all; and finally obtaining permission and negotiating successfully with other governments, a few went to Cyprus, while in 1899 a band of 2,000, under a son of Count Tolstoi, settled on lands granted them in Manitoba. The next year 5,000 more were located there and in the Northwest Territories. They would not take lands in severalty, but only in communities; but they were prospering and learning English, filling the schools with their children, and appearing to slough off their unassimilable characteristics. Suddenly they adopted the tenet that all use of animals or their products for human service is sinful, and refused to eat milk, butter, or eggs, wear woolen or leather garments, or use draft animals. Then one settlement refused to pay school taxes, till the government seized and sold their cattle. In the summer of 1902 they all at once turned their stock loose on the prairies and began hauling their own loads to market, sometimes 50 miles off, and themselves drawing the plows; the government rounded up the stock, sold it, and placed the proceeds to the credit of the communities. While crippled in power to work for lack of animals, the rumor spread that Jesus was shortly to appear at Winnipeg, 300 miles east, to lead them to a new kingdom; they deserted the villages, and on the night of 27 Oct., 1,500 to 2,000 set off across country. After dreadful sufferings from cold and hunger, and joined by thousands more, men, women, and children, they came near Yorkton 10 days after, and lay out in the fields with the thermometer at 22°. The police singled out the women and children and the sick, and locked them into comfortable quarters: several hundred of the men went on alone, the women clamoring to accompany them and some going insane. When about 100 miles from Winnipeg, the mounted police forced them into freight cars and took them back to their villages. These antic seizures make it probable that the persecutions of the Russian government were not wholly without excuse or humane intent.

Doulton, Sir Henry, English potter: b. Lambeth 24 July 1820; d. 19 Nov. 1897. At 15 he entered his father's establishment there, where he devoted himself to the most technical branch of the industry, and worked for many years at the potter's wheel. In 1846 he commenced the manufacture of stoneware pipes for sewage and drainage, for which a special factory was erected near Lambeth Palace, and thus initiated the substitution of impervious pipes for the old flat-bottomed brick drains. Sir Henry Doulton, however, is chiefly noteworthy as having been mainly instrumental in bringing about the revival in art pottery which has since spread into every civilized country; and his firm's works in art stoneware, silicon, impasto, terracotta, faience, and Doulton wares, have since 1870 gained the highest awards of judges at every exhibition of note throughout the world.

He was created a Chevalier of the Legion of Honor (1878); was awarded the Albert medal in 1885; and in 1887 was knighted on the occasion of the queen's jubilee. See POTTERY.

Doune, Scotland, village of Perthshire, on the Teith, nine miles from Stirling. Doune Castle, now a ruin, is described in Scott's 'Waverley'. Pop. 1,200. At Deanston, a mile west, are large cotton-mills, long managed by James Smith, a noted inventor and philanthropist.

Douro, dô'roo, or **Duero**, doo-a'rô (ancient *DURIUS*), one of the largest rivers of the Spanish Peninsula, which, flowing west, traverses about one half of Spain and the whole of Portugal, and, after a course of 500 miles, flows into the Atlantic three miles below Oporto. It is not of much navigable importance, but small vessels ascend about 70 miles from its mouth. In the Middle Ages it was celebrated for the gold that was found in its bed.

Douroucoulî, doo-roo-koo'lê, a small Brazilian monkey, of nocturnal habits, which sleeps by day, and preys fiercely by night upon insects and small birds. It is of the genus *Nyctipithecus*, of which various species are known, all South American. They are about nine inches long, with tails somewhat longer than their bodies; and have soft grayish fur; their voices are discordant and disagreeable. They are known also as "owl-monkeys," and "night-monkeys."

Dousa, Janus (Latinized from JAN VAN DER DOES), Dutch statesman, philologist, historian, and poet: b. Noordwyk, Holland, 6 Dec. 1545; d. there October 1604. In 1572 he went as ambassador to England to obtain the support of Queen Elizabeth for the cause of the Dutch. As chief commander, during the siege of Leyden by the Spaniards, he conducted himself with prudence and courage in the midst of the horrors of famine, plague, and civil dissensions. He kept up an intercourse with the expected deliverers by means of trained pigeons; and to these faithful messengers he has expressed his gratitude in some of his poems. The stadtholder, William I., compensated the city for its sufferings by the establishment of the university, of which Dousa was the first curator. His best-known work is 'Bataviæ Hollandiæque Annales' (1599).

Douw, Gerard. See DOW, GERARD.

Douzzette, dow'zët, **Louis**, German painter: b. Triebsees, Pomerania, 25 Sept. 1834. He received a gold medal at Berlin in 1886. He is a landscape painter almost exclusively, and is particularly noted for his moonlight effects. His 'Moonlight on the Fjord' is in the Dresden gallery.

Dovalle, Charles, shârl dô-vâl, French poet: b. Montreuil-Bellay 23 June 1807; d. 30 Nov. 1829. He was a poor provincial who came to Paris unknown, studied law, and burst on the literary world with 'The Oratory in the Garden,' and other delightful poems of a like nature, besides an 'Ode on Liberty.' His promising career was closed at 22 in a duel, the challenger being enraged at a literary criticism.

Dove, Heinrich Wilhelm, hîn'rih vîl'hêlm dô'vê, German physicist and meteorologist: b. Liegnitz 6 Oct. 1803; d. Berlin 4 April 1879.

REPRESENTATIVE DOVES.

1. Domestic Turtle-dove (*Turtur risorius*).
2. European Wood-pigeon (*Columba palumbus*) at the left; and Stock-dove (*C. xenas*) at the right.
3. American Wild or Passenger Pigeon (*Ectopistes migratorius*).

4. Papuan Crowned Pigeon (*Coura albertisi*).
5. Crested and Common Australian Bronze-winged Doves.
6. Blue Rock-dove (*Columbia livia*).

He was educated at Breslau and Berlin, and in 1845 he was appointed professor of natural philosophy at the university of the latter city, a post which he held till his death. Among his works are 'Meteorological Researches' (1837); 'Distribution of Heat on the Surface of the Globe' (1852); 'Law of Storms' (1857); 'Optical Studies' (1859), and many papers in various journals.

Dove, Patrick Edward, Scottish economist: b. Lasswade 1812; d. Cape Town, Cape Colony, 1870. He was graduated at Aberdeen and studied at Heidelberg, achieving fame with 'The Theory of Human Progression' (1850), from which Henry George was accused of stealing the "single tax" idea. Dove wrote also: 'Science of Politics.'

Dove, a river in England, a tributary of the Trent, has its rise in the hills of the Peak of Derbyshire. It was the favorite fishing stream of Izaak Walton, who lived near with his friend, Charles Cotton; and it is still beloved of anglers.

Dove, originally applied in England to several native and domesticated species of the genus *Columba*; the name dove is now used generally for the smaller species of the pigeon family (*Columbidae*, q.v.), but in many cases interchangeably with pigeon. The name applies to about 10 native North American species, of which the most important are the mourning dove (*Zenaidura macroura*); the white-winged dove (*Melopelia leucoptera*); the ground dove (*Columbigallina passerina*), and several species of ground dove, of which only the first extends its range northward, the others being more especially derived from the West Indian and Mexican fauna, which includes many additional species. The mourning dove, so-called on account of its plaintive call, and unadorned plumage, ranges and breeds throughout temperate North America. The nest is a loose structure of twigs in which two eggs are deposited. In the late summer and autumn, when congregated in small flocks, doves are sometimes destructive to crops, and are much sought by gunners in localities where the game laws permit.

Several species of European and other exotic doves are well-known in this country in the domesticated state. The ring dove (*Columba palumbus*) occurs throughout Europe, collecting in large flocks during the winter and depredating fields of turnips and other crops. The rock dove, or rock pigeon (*C. livia*), is considered by Darwin ('Animals and Plants Under Domestication') to have been the original stock of our domesticated pigeons, which, as a result of careful selection, have diverged into many races, arranged by Darwin in four principal groups: (1) Pouters; (2) Carriers, Runts, and Barbs; (3) Fantails, Tumblers, Turbits, etc.; and (4) Trumpeters—which lead through some little modified varieties to the original stock still existing on the coasts of Europe and North Africa.

The turtle dove (*Turtur communis*), of Europe has been universally adopted in Christian countries as the emblem of gentleness and love, and figures much in poetry. The dove was the bird of Venus. Babylon was the city of the dove; it was a dove that whispered into the ear of Mohammed, and was his oracle. The dove was a sacred bird to the Israelites, and Jerusa-

lem was the city of the dove. In Christian times it was the attribute of the Virgin Mary; was a symbol of the Holy Ghost, and carved on the tombs of martyrs as a figure of the resurrection.

Dove, The, one of two vessels which in 1633 sailed from Cowes, England, for Maryland with a company of colonists under Leonard Calvert. The other vessel was named The Ark. After a four months' voyage they landed on St. Clement's Island in the Potomac River.

Dove-plant, or **Holy Ghost Plant**, an orchid of Central America, much revered by the pious natives because of its resemblance to a dove with outstretched wings, the symbol of the Holy Ghost; called also Holy-Spirit flower.

Dove-tick, a bird parasite (*Argas reflexus*), the blind tick which infests doves and other birds. Some of the species are said to cause death by their sting. See Tick.

Dovekie, düv'kî, the little auk (*Alle alle*), one of the smallest of the family *Alcidae*, a bird of high northern latitudes, living and breeding gregariously, on rocky sea-coasts of the North Atlantic and Arctic oceans. A single egg is laid by this bird on the bare rock. In winter, it is found along the coast of New England and the Middle States, and is occasionally blown by storms as far inland as Michigan. The dovekie, or sea dove, as it is also sometimes designated, is from eight to nine inches long; of a glossy blue-black above, with the under parts, and two patches on each wing, white. The adults have a small crest on the base of the beak.

The name is also sometimes applied by fishermen to one or more species of guillemot (q.v.).

Do'ver, Del., city, capital of the State and county-seat of Kent County; on Jones creek, and the Philadelphia, W. & B. R.R., 75 miles south of Philadelphia. It is the seat of Wilmington Conference Academy and has a handsome monument erected to the memory of Cæsar Rodney, one of the signers of the Declaration of Independence. It is the centre of a great fruit-growing region. It is on high ground; is laid out with wide, straight streets that cross each other at right angles; and is built up chiefly with brick. Among its noteworthy buildings are a handsome State house, large courthouse, and new United States government building. Connected with the State house is a State library with upward of 50,000 volumes. There are several churches, a national and a State bank, fruit evaporating and packing establishments, steam flour-mill, foundry, machine shop, and sash, fruit crate, glass, and carriage factories. The city has valuable gas and water works, weekly newspapers, and good schools. Pop. 3,329.

Dover, England, a Cinque port and parliamentary and municipal borough in the east of Kent, England, 66 miles east-southeast of London. It is the headquarters of the South-eastern District of the British Army, and the nearest point of the English coast to France. The fortifications comprise Dover Castle, which occupies a commanding position on the chalk cliffs, 375 feet above the level of the sea, and still includes some of the old Saxon and Norman work; Fort Burgoyne on the north side of the town; Archcliffe Fort to the west, and the

DOVER—DOW

batteries on the Western Heights, where large barracks are situated. Pop. 35,000.

Dover, N. H., city, county-seat of Strafford County; on Cocheco River, and the Boston & M. R.R.; 168 miles north-northeast of Boston. It is situated on hilly ground, is regularly laid out, and has many handsome buildings and residences. The Falls of Cocheco, within the city limits, are the source of abundant water power. Dover's industries include several large cotton- and woolen-mills; an extensive print works, with a capacity of over 30,000,000 yards annually; manufactories of boots and shoes, oil cloth, hats and caps, sandpaper and glue; and several tanneries, brass- and iron-foundries, and machine shops. There are several churches; about 40 public schools, high school, St. Joseph's Hill School, Franklin Academy; a national bank; several savings banks; daily and weekly newspapers; electric lights, and street railways. It is the oldest city in the State; was settled in 1623; nearly destroyed by the Indians in 1689; and was chartered as a city in 1855. Pop. (1900) 13,207.

Dover, N. J., city in Morris County, on the Rockaway River, the Lackawanna, and the New Jersey C. R.R.'s, and the Morris and Essex Canal; 28 miles west of Newark. It has extensive iron interests, railroad shops, machine shops, furnace and stove factories, and silk and hosiery mills. Five miles distant is a government powder magazine. Nearby are Lake Hopatcong, Mt. Arlington, Budd's Lake, and Schooley's Mountain, all noted summer resorts. The city has a high school, several churches, business college, daily and weekly newspapers, electric lights, and a national bank. Pop. 6,000.

Dover, Tenn., town, county-seat of Stewart County; on the Cumberland River, near Fort Donelson (q.v.). It is an insignificant village of less than 500 inhabitants, but is noteworthy as containing a national cemetery, where 672 soldiers of the Civil War are buried.

Dover, Strait of, the narrow channel which connects the North Sea with the English Channel, and separates England and France. At the narrowest part it is only 21 miles wide. The depth of the channel at a medium in the highest spring tides is about 180 feet. On both the French and English sides the chalky cliffs show a correspondence of strata which leaves no room for doubt that they were once united. Various projects for connecting Dover and Calais more closely have been advanced, as by bridge or tunnel or by trains on submerged rails. When making examinations for the tunnel scheme, coal was discovered in the bed of the Strait.

Dover's Powder was first prescribed by Thomas Dover, M.D. (1660-1742). The powder is prepared by mixing powdered ipecacuanha root, 1 part; powdered opium, 1 part; and sulphate of potash, 8 parts. The whole is thoroughly mixed, and the ordinary dose is from 5 to 10 grains. Occasionally, saltpetre is added. It is a most valuable medicine, and acts as a sudorific, increasing the proportion of sweat or sensible perspiration. As a "home remedy" for warding off a cold it is considered invaluable. Three or four grains will often relieve an attack of heartburn.

Dovetail, a term used in carpentry; the fastening of boards together by letting one piece into another, in the form of the tail of a dove. The dovetail is the strongest of jointings, because the tenon, or piece of wood which is put into the other, goes widening to the end, so that it cannot be drawn out again. Dovetails are either exposed or concealed; the latter being of two kinds, lapped and mitred. There is also a dovetail hinge, dovetail saw, dovetail file and in Roman architecture an ornamented molding in the form of a dove's tail.

Doveton, Frederick Bazett, English author: b. Exeter 1841. He has published 'Snatches of Song' (1880); 'Sketches in Prose and Verse' (1886); 'Maggie on Mythica: a Fairy Tale' (1890); 'Songs Grave and Gay' (1893); 'A Fisherman's Fancies' (1895); 'Mirth and Music' (1901).

Dovizio, Bernardo, bër-nâr'dô dô-vě'tsě-ô. See BIBBIENA.

Dovre-fjeld, dôv-rě-fyål', or **Doerines**, an assemblage of mountain masses, Norway, forming the central part of the Scandinavian system, and extending east-northeast from lat. 62° N., where the Langfeld terminates, to lat. 63°, where the Koelen begins. It is generally composed of gneiss and mica-schist, and its highest summit is Snehaetten, 7,620 feet.

Dow, or Douw, Gerard, Dutch painter: b. Leyden 7 April 1613; d. there Feb. 1675. He studied under Rembrandt, and was distinguished for the excellence of his coloring and *chiaroscuro*. He surpassed his master in diligence, and nothing can be more finished than his small pieces, which are so delicate that a magnifying-glass is necessary to see distinctly the work in them. His softest figures are full of life, and he never neglected, in his representations, the almost invisible minutiae of nature. He is regarded as the inventor of the ingenious mode of painting large pictures on a reduced scale, by covering the original with a frame, including a space divided into small quadrangular parts by means of threads, and then transferring the parts into an equal number of similar divisions, drawn on the canvas. He made use of the convex mirror to represent objects on a reduced scale. His works are still among the dearest of the Dutch school. His picture of 'The Fish Merchant' when sold in 1883 brought about \$10,000.

Dow, Lorenzo, American preacher: b. Coventry, Conn., 16 Oct. 1777; d. Georgetown, D. C., 2 Feb. 1834. Adopting the doctrines of the Methodists, 1796, he finally received a regular license to preach, and, in spite of contumely and rebuffs, and ceaseless hardships and dangers of all kinds, persevered for nearly 40 years, with an enthusiasm which never relaxed, and often with astonishing effect. In the course of his ministry he traveled over many parts of the United States and Canada, and in 1799 and again in 1805 visited England and Ireland, where his peculiar eloquence attracted much attention and on several occasions subjected him to persecution. Dow's eccentricity of manner and dress for a long time excited a prejudice against him, and in many parts of the country he was familiarly known as "crazy Dow." But to the class whom he most frequently addressed, his simple fervor, though coupled with illiterate phrase-

DOW—DOWLER

ology, supplied the place of eloquence, and he seldom failed of having attentive and even enthusiastic hearers. His journal, containing the history of his life to his 40th year, together with some of his miscellaneous writings, was published in 1856.

Dow, Neal, American temperance reformer: b. Portland, Me., 20 March, 1804; d. 2 Oct. 1897. He was the author of the bill which prohibited the manufacture and sale of intoxicating liquors in the State of Maine, widely known as the "Maine Law." During the Civil War he was colonel of a Maine regiment and a brigadier-general of volunteers. In 1880 he was the Prohibitionist candidate for the Presidency.

Dowd, Charles Ferdinand, American educator: b. Madison, Conn., 25 April, 1825. He was graduated at Yale in 1853, and for many years he has been principal of Temple Grove Seminary at Saratoga. He originated the idea of longitude standards for railroad time, and advocated the 24-hour time notation.

Dowden, Edward, English literary critic and historian: b. Cork, Ireland, 3 May, 1843. He was educated at Queen's College, Cork, and Trinity College, Dublin, and 1867 was elected to the professorship of English Literature in the latter institution, a post he still holds. Besides many valuable articles in periodicals he has published many works on literary subjects, of which the most important are 'Shakspeare: His Mind and Art' (1875); 'Poems' (1876); 'Shakspeare Primer' (1877); 'Studies in Literature' (1878); 'Southey' (1880); 'Life of Shelley' (1886), the chief authority on the poet's life, being founded on papers in the possession of the Shelley family; 'Transcripts and Studies' (1888); 'Introduction to Shakspeare' (1893); 'New Studies in Literature' (1895); 'The French Revolution and English Literature' (1897); 'History of French Literature' (1897); 'Puritan and Anglican' (1900). He has also edited editions of Shelley, Wordsworth, etc. In 1896 he lectured in the United States.

Dowden, John, Scottish prelate: b. Cork, Ireland, 29 June 1840. He is a brother of E. Dowden (q.v.). He was educated at Queen's College, Cork, and Trinity College, Dublin, and taking orders in the Scottish Episcopal Church became Bishop of Edinburgh in 1886. He has published 'The Annotated Scottish Communion Office'; 'The Celtic Church in Scotland'; 'History of the Theological Literature of the Church of England'; 'The Workmanship of the Prayer Book.'

Dower, the estate for life which a widow acquires in a certain portion of her husband's real property after his death. Dower, by the common law of the United States, entitles the widow to a third part of all the lands and tenements of which the husband was seized in fee simple, at any time during the coverture; but the rule varies widely on many particulars in the different States. Tenancy in dower is where a widow takes a third of such lands and tenements of which her husband dies possessed, and in which her title to dower has not been previously barred. Some have ascribed dower to the Normans, but it was first introduced into the feudal system by the German Emperor Frederick II., who was contemporary with

Henry III. of England. The person endowed must be the actual wife of the party at the time of his decease. If she be divorced *a vinculo* she shall not be endowed; but a judicial separation does not destroy the dower.

Dowie, John Alexander, American leader of a religious sect: b. Edinburgh, Scotland, 1847. He studied for the ministry, and held two pastorates in Sidney, Australia, but subsequently became an evangelist preacher. While in Australia he organized the International Divine Healing Association of which he became president. In behalf of this association he traveled in England and America, and finally settled in Chicago in 1890. Here he built his wooden "tabernacle" in Woodlawn, which was opened in 1893, and attracted large crowds by his preaching and faith cures. He later organized the Christian Catholic Church in Zion, which grew rapidly, adding many auxiliary lines of work, such as a college for Zion preachers, a training school for deaconesses, and a number of charitable institutions. Dowie had already established a publishing house, which became a part of the organization, and had full control of a bank, known as the Zion bank. He finally organized a land association, and purchased a large tract of land on the shores of Lake Michigan, where he and his devotees are building Zion City, the centre of all the numerous activities of the Christian Catholic Church; here he has also established a lace industry. In this city he is practically dictator, forbids smoking, drinking, card playing, etc., and oversees all branches of the work. He also preaches frequently, and gives special attention to the healing of the sick. In 1901 he made the claim of being "Elijah the Restorer." In 1903 he built the new tabernacle at Zion City, near Chicago, Ill., which he claims is the largest building in the United States devoted exclusively to the worship of God.

Consult Buckley, 'Dowie Analyzed and Classified' ('Century Magazine,' Vol. LXIV., pages 928-32); Napes, 'John Alexander Dowie and his Zions'; ('Independent,' Vol. LIII. p. 1786-91); Swain, 'John Alexander Dowie' ('Century Magazine,' Vol. LXIV. p. 933-44).

Dowitcher, dow'ich-ēr, a sporting name for birds of the genus *Macrorhamphus*, which are related to the snipes, and are much hunted along the beaches of this country, during the season. Two species, breeding far north, winter in South America and Mexico. The birds are from 10 to 12 inches long, with a bill nearly one fourth the length of the body. The upper parts are dark, while the under feathers are reddish.

Dow'las, a kind of coarse linen, very commonly worn by the lower classes in the 16th century; also a strong calico made in imitation of the linen fabric. The name is said to be derived from Doullens, a town in the department of Somme, France. Before the introduction of machine-woven cotton cloth, dowlas was manufactured largely in Yorkshire, England, and in the south of Scotland.

Dowler, Bennett, American physician: b. Moundsville, Va., 16 April 1797; d. New Orleans 1879. He graduated from the University of Maryland, and settling in New Orleans founded the New Orleans Academy of Sciences, and was for a number of years editor of the

DOWLETABAD — DOYEN

‘Medical and Surgical Journal.’ He made a number of experiments with the human body immediately after death, resulting in important discoveries in regard to capillary circulation, contractibility, etc., and also investigated the subject of animal heat. He wrote ‘Tableau of the Yellow Fever of 1853’ (1854).

Dowletabad, dow-lē-tā-bād’, or **Daulatabad**, India, one of the most remarkable fortresses of India, in the Nizam’s Dominions (Haidarabad), 10 miles northwest of Aurangabad. The strong part of it consists of an isolated rock or mass of granite, 500 or 600 feet high, and forming, for about 150 feet, a mural precipice. The only access to the small platform on the summit, is through a low excavation in the heart of the rock. There is a ditch and other works round the base of the rock.

Down, county of Ireland, in the province of Ulster; area 610,730 acres. It possesses good agricultural land, and is rich in minerals. Pop. 289,335.

Downes, William Howe, American journalist art critic: b. Danbury, Conn., 1 March 1854. He has been a staff writer on the Boston *Transcript* for many years. He has published ‘Spanish Ways and By-ways’; ‘The Tin Army of the Potomac’; ‘Arcadian Days’; ‘Twelve Great Artists’; and written many papers on art matters for various magazines.

Downfall, The (‘LA DÉBÂCLE’), a novel of the Franco-Prussian war, by Émile Zola, published in 1892. The siege of Sedan forms the dramatic centre of the story, which is concerned chiefly with the friendship of Macquart and Levasseur, and the love of Macquart and Levasseur’s sister Henriette.

Downing, Andrew Jackson, American landscape gardener: b. Newburg, N. Y., 20 Oct. 1815; d. near Yonkers, N. Y., 28 July 1852. His ‘Landscape Gardening and Rural Architecture’ (1841); ‘Cottage Residences’ (1842); ‘Fruits and Fruit Trees of America’ (1845); were long considered authorities on the subjects of which they treat.

Downing, Charles, American horticulturist: b. Newburg, N. Y., 9 July 1802; d. there 18 Jan. 1885. In 1837 he established a nursery near the city of Newburg, and remained in the business for 30 years. His experiments resulted in the improvement of many varieties of fruit, and he was regarded as an authority on horticulture and fruit growing. In the later years of his life he contributed articles to various periodicals, and revised and greatly enlarged ‘Fruits and Fruit Trees of America,’ written by his brother, A. J. Downing (q.v.).

Downing, Fanny Murdaugh, American author: b. Portsmouth, Va., about 1835; d. 1894. She was the author of the novels ‘Nameless’ (1865), and ‘Perfect through Suffering’; and the poems ‘The Legend of Catawba’ and ‘Dixie’ (1867).

Downing, R. F., American customs broker and shipper: b. New York 5 May 1849; d. Brooklyn, N. Y., 30 April 1903. He founded the brokerage and shipping firm of R. F. Downing & Co. and with each alteration in the tariff law published the work known as ‘Downing’s Customs Tariff.’

Downing College, one of the colleges of the University of Cambridge, chartered in 1800

and opened in 1821. Its founder was Sir George Downing, a Cambridgeshire gentleman, grandson of the politician after whom Downing Street in London was named. The objects of the founder were but partially realized, as his legacy was wasted in costly litigation, and in 1903 less than one half of the contemplated quadrangle was completed and there were but few fellows and students.

Downing Street, a short street in Whitehall (named after Sir George Downing (q.v.), secretary to the treasury in 1667), London, England, where are the colonial and foreign offices, with the official residence since 1735 of the first lord of the treasury. Here cabinet councils are held, hence the term is sometimes employed for the government in office.

Downs, hilly tracts of grassy land suited for pasture; especially two parallel ranges of grassy hills in the south of England, the North Downs running east to west from Hants through Surrey and Kent to Dover, the South Downs in Hants and Sussex, terminating at Beachy Head.

Downs, The, a celebrated roadstead for ships, extending six miles along the southeast coast of Kent, in England, between the North and the South Foreland, where outward and homeward bound ships frequently make some stay, and men-of-war often rendezvous in time of war. It affords excellent anchorage, and is sheltered by Goodwin Sands, but is open to the south. Deal, Dover and Sandown castles are its defense. An obstinate sea-fight took place here in 1666 between the English and Dutch.

Doxology, an ascription of praise to the Almighty: in particular the Greater Doxology (*Gloria in excelsis*, Glory to God in the highest) and the Lesser Doxology (*Gloria Patri et Filio*, etc., Glory be to the Father and the Son; etc.) The Greater Doxology, as is seen, opens with the words of the evangelist St. Luke when he recounts the circumstances attending the birth of Jesus at Bethlehem; the heavenly host chanting Glory to God in the highest, and on earth peace among men of good will. This Greater Doxology has a place in the Roman Catholic liturgy and in the communion service of the Anglican Church. Its introduction into the liturgy dates only from the time of Pope Symmachus (beginning of 6th century); previously it had been customary to recite it after the Mass. The Lesser Doxology had its origin apparently in the commission given to the Apostles (Matt. xxviii. 19) to teach all nations; baptizing them ‘in the name of the Father, Son, and Holy Spirit.’ An ancient form of this Doxology is ‘Glory to the Father in the Son,’ and that was considered to be consistent with orthodoxy till the Arians favored it as expressing their view of the relation of Jesus Christ to God the Father: then the orthodox rejected it and employed the other formula exclusively. In the Roman Catholic Breviary at the end of each of the psalms of the daily office the *Gloria Patri*, etc., is always pronounced. The latter portion of this doxology, ‘as it was in the beginning, is now, and ever shall be. Amen,’ was appended as a protest against certain heretics of the 6th century who denied the Son’s eternity.

Doyen, Gabriel François, gāb-rē-ēl frāñ-swā dwā-yāñ, French painter: b. Paris 1726; d. St. Petersburg 5 June 1806. After study with Van Loo, he obtained the Grand Prix de

Rome, and spent many years in Italy. His 'Triumph of Amphitrite' is in the Louvre, and an 'Adoration of the Magi' in the museum at Darmstadt. Other noted productions are in various churches, his most famous production, 'Miracle des Ardes,' painted in 1767, being in that of St. Roch, Paris.

Doyle, Sir Arthur Conan, English novelist: b. Edinburgh, Scotland, 22 May 1859. He is a nephew of Richard Doyle (q.v.). He was educated at the Roman Catholic college at Stonyhurst, Lancashire, and at the University of Edinburgh. After practising as a physician at Southsea (1882-90), the success of several of his books induced him to give up the profession for that of literature. He has published 'A Study in Scarlet' (1887); 'The Captain of the Polestar' (1888); 'Micah Clarke' (1888); 'The Sign of the Four' (1889); 'The White Company' (1890); 'The Firm of Girdlestone' (1890); 'The Adventures of Sherlock Holmes' (1891); a very popular series of detective stories; 'The Refugees' (1891); 'The Great Shadow' (1892); 'Memoirs of Sherlock Holmes' (1893); 'Round the Red Lamp' (1894); 'The Stark Munro Letters' (1895); 'Exploits of Brigadier Gerard' (1896); 'Rodney Stone' (1896); 'Uncle Bernac' (1897); 'The Tragedy of the Korosko' (1898); 'Songs of Action' (1898); 'A Duet with an Occasional Chorus' (1899); 'The Green Flag and Other Stories' (1900); 'The Great Boer War' (1900); 'Cause and Conduct of the War'; 'The Hound of the Baskervilles' (1902). He has also written the plays, 'A Story of Waterloo' (1894); 'Halves' (1899), etc. He was knighted in 1902.

Doyle, C. W., American physician and author: b. Landour, India, 29 Aug. 1852; d. Santa Cruz, Cal., 1903. He was educated at Calcutta University, studying medicine in London, Edinburgh and Aberdeen. He was graduated from the latter in 1875, and practised in England till 1888, when he went to California to live, continuing his practice there. He has published much verse and prose in the magazines, and the volumes 'The Taming of the Jungle' (1889); 'The Shadow of Quong Lung' (1899).

Doyle, Sir Francis Hastings Charles, English poet: b. Nunappleton 1810; d. 8 June 1888. He was educated at Eton and Oxford, held the post of receiver-general and next of commissioner of customs, and in 1867 he was elected to the chair of poetry in Oxford University for the term of five years, being then elected for a second term of the same duration. He had already published 'Miscellaneous Verses' (1841); 'Two Destinies' (1844); 'The Return of the Guards and other Poems' (1866); and he subsequently published his Oxford lectures (1869 and 1877), and 'Reminiscences and Opinions 1813-85' (1886).

Doyle, John, English caricature artist: b. Dublin 1797; d. 2 Jan. 1868. After studying art in his native city he went to London in 1821, and produced a series of caricatures which became famous as the "H. B." caricatures from the initials attached to them, the identity of the artist remaining unknown. From 1829 to 1851 all the politicians of note were in this way gently and cleverly satirized, always within the limits of good taste and gentlemanly feeling. These works, which were executed by means of lithography, appeared in sets of four or five at a

time, and ultimately the plates amounted to over 900 in number.

Doyle, John Andrew, English historian: b. 14 May 1844. He was educated at Eton and Balliol College, Oxford. He has published 'The American Colonies' (1869); 'A History of the United States' (1875); 'The English in America,' Vol. I.; 'Virginia, Maryland and the Carolinas' (1882), Vol. II.; 'The Puritan Colonies' (1887).

Doyle, Richard, English artist: b. London Sept. 1826; d. there 11 Dec. 1883. His father, John Doyle (q.v.), the author of the celebrated "H. B." caricatures, initiated him into the mysteries of his art, and the young draughtsman became one of the founder-illustrators of "Punch," the current design on the cover of which was invented by him. His sketches of the 'Manners and Customs of ye English' in that periodical, and the 'Bird's-eye Views of Society' in the early pages of the 'Cornhill Magazine,' illustrate the mode of life and manners of London men and women of his time with rare felicity and fidelity. In 1850 he severed his connection with 'Punch' on account of its frequent attacks on the Pope and Doyle's co-religionists, the Roman Catholics. From that time he contributed many illustrations to books. His watercolor pictures of fairy lore are well known.

Doylestown, Pa., town, county-seat of Bucks County, about 25 miles in an air line from Philadelphia. It is the terminus of a branch of the Philadelphia & R. R.R. The town is thriving and has a number of fine public buildings. Its chief manufactures are, agriculture and wagon spoke works, flour and saw-mills, creameries, clay works, and a foundry. Pop. (1900) 3,034.

Dozy, Reinhart, rin'härt dō'zē, Dutch Orientalist and historian: b. Leyden 21 Feb. 1820; d. 29 April 1883. He was thoroughly versed in most of the Semitic tongues, and spoke and wrote almost all the European languages with facility. Among his works (sometimes written in Dutch, and sometimes in French) are 'Histoire des Musulmans d'Espagne de 711-1110'; 'Géographie d'Edrisi'; 'De Israeliten te Mekka' (1864); 'Het Islamisme' (1863); 'Supplements aux Dictionnaires Arabes' (1878-89).

Draa, drā, or Wady Draa, a river of Morocco, rising in the Atlas Mountains and flowing southwards till it penetrates the Anti-Atlas at Shagerun. Beyond this point it flows sluggishly through the desert, at first south and then west, forming the shallow lagoon El Debaia. After this it is a wady constituting the southern limit of Morocco.

Dracæna, dra sē'na, a genus of tropical plants of the natural order *Liliaceæ*. The species are characterized by woody stems, which bear numerous sword-shaped leaves crowded together near the summit, and greenish-white or yellowish flowers, in panicles or heads. A few of the species are cultivated in hothouses, for their attractive colored foliage. The most notable species is, probably *D. draco*, the dragon-tree of the Canary Islands, which attains a height of from 30 to 50 feet, though in one notable specimen, at Teneriffe, the height was 70 feet, and the diameter 15 feet. This was when Humboldt visited the island. When this tree was

DRACHENFELS—DRAFT RIOTS

destroyed by a storm in 1868 it was estimated to be about 6,000 years old. It was not only an object of worship, but its sanctuary was inside its own trunk.

Drachenfels, drā'hēn fēlz, "the castled crag of Drachenfels," as Byron calls it, one of the hills known as the Siebengebirge, in the government of Cologne, in Rhenish Prussia, about eight miles southeast of Bonn. It is the most remarkable of the group, which are all evidently volcanic; rises about 900 feet above the Rhine, and is crowned by the old castle of Drachenfels, commanding a magnificent view. It takes its name (Dragon Rock) from the legend of a dragon which occupied a cavern in it, and was slain by Siegfried, the hero of the Nibelungenlied.

Drachma, drāk'mā, the unit of weight and of money among the ancient Greeks, both as a weight and a coin contained six oboli, and was itself the one hundredth part of a mina, and the six thousandth part of a talent. The weight of the Attic drachma was 67.5 grains English troy weight, and the Attic talent 70.3 pounds. There were several other kinds of drachma and talent in use: those of Ægina were the heaviest. Whenever no particular kind is designated, the Attic talent is meant. The drachma was the principal Greek coin. It was of silver, and was divided, like the weight, into six oboli (silver). The tetradrachma (of four drachmas) was called the *stater*, but other coins also bore this name. These coins differed much in value in the different states of Greece and at different periods. The Attic drachma and stater occur most frequently. The value of the former may be stated as 17 cents, of the latter at about 80 cents. The drachma was regarded as equivalent to the Roman denarius. Besides these silver coins there were also the stater (or didrachm) of gold, equal in value to about \$5.63. In the time of Solon a sheep could be bought for one drachma, an ox for five. In the time of Demosthenes a fat ox cost 80 drachmas, a lamb 10. The drachma has an important position in the coinage and currency of modern Greece, being the standard unit of reckoning, and a silver coin equivalent to the French franc.

Drach'man, Bernard, American rabbi: b. New York 27 June 1861. He was educated at Columbia University and the University of Breslau and has been professor of biblical exegesis and Hebrew philosophy in the Jewish Theological Seminary of New York from 1887, and rabbi of the congregation Zichon Ephraim in that city from 1889. He is a staunch supporter of orthodox Judaism and is the author of 'The Place and Importance of Jehuda Hajjug in the History of Hebrew Grammar' (1885).

Drachmann, Holger Henrik Herholdt, hōl'gēr hēn'rik hēr'hōlt drā'mān, Danish poet, painter, and novelist: b. Copenhagen 9 Oct. 1846. He is essentially an improvisatore; and his works show a lively fancy and excel in descriptions of the life of the common people, especially fishermen and mariners. His 'Poems' appeared in 1872. His novels include 'Condemned' (1890); 'Once Upon a Time'; 'Paul and Virginia' (1879); and 'Sea Tales.' His best known painting is 'From Hamburg Harbor,' presented by the Danes in Hamburg to the king and queen of Denmark a few years ago. Drachmann visited the United States in 1898.

Draco, drā'kō, Athenian legislator: fl. about 621 B.C. His name has become proverbial for severity, and his laws were hence said to have been written in blood, not ink. It seems, however, probable that Draco only put in writing the laws of his time and nation, which punished petty theft, and even idleness, no less severely than the robber of the temples and the murderer. Subsequently years afterwards, Solon was commissioned to draw up a new code. Tradition relates that Draco, on his appearance in the theatre at Ægina, was suffocated by an enthusiastic audience, who, according to their custom, threw their garments and caps upon him.

Draco, an ancient northern constellation. The star Draconis, a bright star nearly in the solstitial colure, was used in determining the coefficient of aberration of the fixed stars.

Dracoceph'alum, a genus of odoriferous annual or perennial herbs, of the mint family (*Labiata*), numbering about 35 species, natives of the northern hemisphere. The name is Greek for Dragonhead, which is a reference to the resemblance of the flowers to the head of the dragons of myth. Of the species comprised in the genus, but two are American. American Dragonhead (*D. parviflorum*) is an annual, two to six feet high with light blue flowers, common in stony soil from Ontario, through northern New York, to Minnesota and Alaska, and in the Rocky Mountain region to Mexico. The other species is found only in a restricted area in Nebraska and northern Mexico. It was introduced from Europe and is listed as Moldavian dragonhead. The most generally cultivated species is (*D. canariense*), or Canary Balm of Gilead.

Dracon'tium, a genus of tropical American araceous plants. They comprise six species distinguished by a fetid flower, tall peduncle, trifid leaves, and tuberous root. *D. polyphyllum* has been recommended as an antidote for snake bites. The skunk cabbage, *Symplocarpus fatidus*, pharmaceutically known as *Dracontium fatidum*, was formerly assigned to this genus. See SKUNK CABBAGE.

Draft, a written order for the payment of a sum of money addressed to some person who holds money in trust, or who acts in the capacity of agent or servant of the drawer. Documents of this kind often pass between one department of a bank or mercantile house and some other department, and are distinguished from bills of exchange and checks, in not being drawn upon a debtor. One reason for using them is the convenience in keeping accounts and having vouchers for payments.

Draft Riots, in New York, July 1863, were serious disturbances caused by the military conscription or drafts (q.v.) of that year, which met with a storm of denunciation from Democratic leaders and followers alike. The former proclaimed it unconstitutional, because military service was due only to the States; dangerous, as liable to absorb all the State militia and civil officials into the Federal service; and partisan in execution, the quotas having been gerrymandered to throw an enormous disproportion on the Democratic districts. This last was true, but was the work of subordinates, and was corrected by the War Department on protest. The

DRAFTS

rank and file execrated it as a class measure, shifting the burden from the rich, to whom \$300 was a trifle, to the poor, who could pay only with their blood, and were least able to leave their families. The only answers were the nation's need, the law of nature that all burdens fall thus on the poor, and the government's wages, bounties, and pensions which strained it to relieve distress. But the legal and party arguments reinforced the class hatred and anti-war prejudice, and Gov. Horatio Seymour, the head of the Democratic party, sent his adjutant-general to Washington about 10 July to urge the postponement of the draft, on the ground of this popular excitement.

The drafting began, however, on Saturday morning, 11 July, at each provost-marshal's or assistant's office; which in the Ninth District, a Democratic stronghold, was at Third Avenue and 46th Street. The method was to place the enrolled names in a wheel and turn it, the first names coming out up to the assigned quota being the conscripts. A large crowd assembled, but made no disturbance; and the names drawn were published in the Sunday papers. Many of the poorer ones, incited and organized by political leaders, met secretly and formed associations to resist; and on Monday morning, parties went around the shops compelling workmen to leave their tasks and join the procession. The drawing was resumed at 10 A.M.; in a few minutes several paving-stones, one after another, were hurled through the windows into the midst of the crowd, smashing the furniture; and in another moment the mob broke in the door, wrecked everything inside but the wheel, beat one of the deputies into insensibility, and set fire to the building, though it was inhabited above. The whole block was shortly in flames; and when the firemen arrived, the hydrants were denied them till the conflagration was past help. The militia were nearly all in Pennsylvania, where Gettysburg had lately been fought, and the few garrison regulars and marines were under different commands; so that the Federal Gen. Wool, the State Gen. Sanford, and Mayor Opdyke, held separate authority with no deciding power. The mob increased, and began wreaking vengeance on political opponents and their property, burning and pillaging; and thieves and toughs, seeing their opportunity, flocked out and joined. Fifty marines, sent to disperse the 46th Street mob, fired blank cartridges, and were instantly routed and chased far along the streets by the rioters, many of them women and children. This changed the mob's attitude from defense to aggression; a squad of police was set upon and one killed. Then their wrath was turned on the negroes, as the cause of the "Black Republican War." These were beaten and stoned to death, and hanged to lamp-posts; hotels and restaurants having colored servants were invaded in search of them, and the movables smashed or stolen. In the afternoon the Colored Half-Orphan Asylum, with 700 to 800 children and nurses, was broken into, gutted and set on fire, the inmates being driven into the street while the women of the mob carried off the furniture. The armory on Second Avenue was broken open with stones and sledge-hammers to secure the arms, the police who bravely defended it driven out, and it was fired. All business and trade were suspended. In the lower

part of the city the office of the *Tribune*, the chief Republican paper, edited by the abolitionist, Horace Greeley, was attacked and about to be set on fire, but the police drove out the rioters. The entire block on Broadway which held the draft office was burned, with the provost-marshal's and the postmaster's private residences, a station-house, a hotel whose proprietor refused liquor to the mob, and other dwellings; and other houses were burned in the upper part. All that day and night the city was protected only by the police, many of whom lost their lives. At midnight a heavy rain dispersed the rioters for the time.

Tuesday was far worse, though the forces of order had begun to gather. The mobs too had swollen so that an army was needed; when bands were dispersed by the military, they gathered elsewhere and continued murder and depredation. Twenty negroes probably had been murdered Monday; far more perished Tuesday, and whole negro neighborhoods were burned out. Lieut. Wood with 150 regulars from Fort Lafayette fired a ball cartridge into a mob, killed a dozen and broke it up, but no officer could be ubiquitous. Col. O'Brien, who had dispersed a mob, sprained his ankle and stepped into a drug store; ordered out by the terrified proprietor, the mob murdered him and dragged his carcass up and down the street, mutilating and trampling on it. Gov. Seymour issued a proclamation summoning the rioters to disperse, but it was so insufficient that he was forced to issue another putting the city under martial law. Meantime the secretary of war had ordered home the militia regiments in Pennsylvania, and they began to arrive on Wednesday; the draft was announced as temporarily suspended; and the mob was so thoroughly beaten and cowed on Wednesday afternoon that cavalry regiments paraded the city at night without meeting any resistance. Isolated gangs prowled about even on Thursday, but they were mere criminals and soon slunk away. The property-holders had formed associations for self-protection, and the danger was mainly at an end by Thursday morning. The losses of these four days were never known. The bills of mortality for the week were 450 above the average; 90 deaths from gunshot wounds were reported; and it was said that many rioters were secretly buried by their friends. Claims for property damage were filed to over \$2,500,000; though heavily scaled, something like \$1,500,000 were paid. The draft was resumed on 19 Aug., and ended on the 28th. Consult: 'Official Records,' XXVII. Pt. 2, 1889; Fry's 'New York and the Conscription of 1863,' 1885; Greeley's 'American Conflict,' Vol. II., 1866.

Drafts, or Military Conscriptions, in the history of the United States, aside from the drafts of the Confederate States of 18 July 1863, and the sweeping one of 17 Feb. 1864, which was in action all through the latter part of the Civil War — are known by those of 1814 and 1863. The former, however, was such only in purpose, as it never went into action or became law. In the Revolution, the regular armies of the United States were recruited by drafts from the State militia (see *CONTINENTAL ARMY*), but these transfers were made by requisitions on the States, who furnished and officered their quotas in such bodies as they chose. The Constitution gave Congress the twofold power to

DRAGE—DRAGON

"raise armies," and to "organize and arm the militia." Knox in 1790, and Jefferson in several annual messages urged a thorough plan for the latter, classifying the militia independently of the State organizations, and drafting one from each section as needed; but jealousy of the States' rights over the militia was too strong. In the War of 1812, requisition was made on States for militia to replace coast garrisons, denuded for invasion of Canada, but Connecticut and Massachusetts refused on the ground that as this country was not invaded, there was no constitutional right to summon the militia. When this excuse failed, others were found; in 1813 a militia organization bill passed the House, but failed in the Senate. In 1814 the increasing exigencies forced a bill through Congress (Senate 10 Nov.; House 9 Dec.), on suggestion of the New York and Virginia legislatures; but even its Democratic supporters doubted its being either constitutional or useful, and the House loaded it with an amendment on which the Senate disagreed, as doubtless intended. The war ended shortly after.—In the Civil War, volunteering filled the armies during the first two years, the quotas being apportioned by congressional districts; then the numbers grew scant, and on 3 March 1863 the "Conscription Bill" passed. The intent was the old plan of militia classification and draft, but the Democrats held it unconstitutional, and their arguments were unanswerable. The Republicans therefore fell back on the broad power to "raise armies," as implying the right to fix the method of so doing; this in turn was incontrovertible, and upheld by the Supreme Court. The State militias were ignored. All able-bodied citizens between 18 and 45 were summoned to the national defense, and were to be enrolled from 1 April on by the provost-marshal; quotas under future calls not filled by volunteers after a certain period were to be made good by lot from the enrollment; conscripts could furnish substitutes or buy exemption for \$300; all persons refusing obedience to be punishable as deserters. Early in May 300,000 more troops were called for; many Eastern cities were already in arrears, and the poorer classes, especially those politically hostile to the War, grew very bitter at the real hardships and the real and alleged unfairness of the conscription. The invasion of Pennsylvania by Lee had drawn the Northern State militia thither in June and early July, and the mob in several places undertook to resist the draft. The police easily put down the rising except in New York, where the great numbers of the rioters, reinforced by the criminal classes, gave the city into their hands for two days, 13 and 14 July, and they were not suppressed till the 15th. (See DRAFT RIOTS.) The drafts interrupted by these disorders were resumed and carried through. But their chief value was in goading the districts into filling the quotas by volunteers; however legal, they were incredibly scanty of direct results. The commutations were toward a third of the whole, the exemptions nearly a half, and the number held and their substitutes together were but a sixth to a fifth. Also, many of the substitutes turned deserters or "bounty-jumpers." It has been estimated that of over 3,000,000 enrolled, less than 100,000 men were obtained by the drafts.

Drage, Geoffrey, English publicist: b. 1860. He was educated at Eton and Oxford and is a barrister of Lincoln's Inn and the Middle Temple, but has never practised. He was secretary of the Royal Commission on Labor, (1891-94), and M.P. for Derby (1895-1900). He has published 'Criminal Code of German Empire with Prolegomena and Commentary' (1885); 'Cyril,' a novel (1889, 8th ed. 1899); 'Eton and the Empire' (1890); 'Foreign Reports of Royal Commission on Labor'; 'Eton and the Labor Question' (1894); 'The Unemployed' (1894); 'The Problem of the Aged Poor' (1895); 'The Labor Problem' (1896).

Drag'oman, the general name given in Levant countries to an interpreter, or to a guide to foreigners. The dragoman is, however, much more than the Italian *cicerone*, or the French *commissionnaire* or *valet de place*. In Syria, for example, he is a contractor for the management of expeditions, and undertakes to solve all the difficulties that arise between the traveler and the natives. The dragomans attached to embassies have special privileges. Student dragomans is a term sometimes given to student interpreters preparing for the British consular service in the Orient. The dragoman to the porte, through whom diplomatic negotiations with foreign powers were formerly carried on, used to be a very important dignitary.

Dragon, a genus of arboreal lizards, of which the most familiar is *Draco volans*. The genus is especially remarkable for the extension of the skin of the sides on the prolonged posterior ribs. A parachute is thus formed which enables the dragon to take rapid swoops from branch to branch. The tail is very long; the skin of the throat forms a loose wattle; the colors are particularly brilliant. There are several species inhabitants of the East Indies, not including Ceylon. The term dragon has also been applied in modern times to a large lizard (*Thorictis dracana*) found in Brazil and Guiana. It attains a length of three feet, most of which goes to the tail. *Tejus* and *Ameiva* are allied genera. See LIZARDS; REPTILES.

Dragon, a fabulous monster found in the mythology of nearly all nations, from Greece to China, where it forms the national ensign. It is usually depicted as a huge serpent of abnormal form. Ancient legends represent the dragon as a snake, watching as sentinel the Garden of the Hesperides, or guarding the tree on which was hung the Golden Fleece at Colchis. In other places it appears as a monster, making the neighborhood around its cave unsafe, and desolating the land; its death being ascribed to a hero or god, providentially appointed for the task, which was a service to all mankind. The dragons which appear in early paintings and sculptures are invariably representations of a winged crocodile.

In Christian art the dragon is the emblem of the Devil. As the form under which Satan, the personification of sin, is depicted, the dragon is met with in pictures of St. Michael, and St. Margaret, when it typifies sin conquered; it also appears under the feet of the Saviour, and under those of the Virgin, in both cases with the same idea. The dragon also typifies idolatry. In pictures of St. George and St. Sylvester, it suggests the conquest of paganism by Christianity. In pictures of St. Martha, it symbolizes the inun-

DRAGON FLIES.

DRAGON — DRAGON-FLY

dation of the Rhone, spreading pestilence and death, and arrested in its course of devastation by the miraculous interposition of Mary's sister. St. John the Evangelist is sometimes represented holding a chalice, from whence issues a winged dragon, in which case it symbolizes the poison which was miraculously eliminated from the chalice wine, into which hemlock had been put. The dragon appears on the shield of the most famous of Christian heroes, as well as on the helmets of kings and generals. It is found on English shields after the time of William the Conqueror. In modern heraldry, it appears on the shield and helmet; as supporter, it is called a lindworm when it has no wings, and serpent when it has no feet; when it hangs by the head and wings it means a conquered dragon.

Dragon, in astronomy, one of the ancient northern constellations, in Latin, *Draco*. The figure is that of a serpent with several small coils. It appears at a very ancient date to have had wings in the space now occupied by the Little Bear. Fable says that Juno translated to the heavens the dragon which kept the golden apples in the Garden of the Hesperides, and which was slain by Hercules. See *HESPERIDES*.

Dragon-fly, an order of insects, the *Odonata*, allied to the may-flies and *Ephemeroidea*, with long, slender bodies, very large mobile heads, immense eyes, short antennæ, and two pairs of long, nearly equal wings of a firm and glossy texture, and closely netted with many veins. The mandibles are powerful, the mouth-parts being so fused and solidified as to form a most effective trap for catching the small insects upon which dragon-flies feed. The pro-thorax is small, the meta-thorax and meso-thorax large, and the meso-thorax slopes over the meta-thorax, by which arrangement the spinous legs are thrust forward, so that they project under the head. These legs are unfitted, and are never used, for walking, but as instruments for catching and holding prey or for clinging to plants. The hind body is proportionately longer than in any other group of insects; it has 10 evident segments, the hindmost carrying a pair of stiff unjointed cercopods. The male genital armor is situated on the second abdominal segment — a position unknown in any other insect; and the intromittent organs are separate from the ejaculatory ducts, the latter being near the extremity of the abdomen. "Therefore," as Howard explains, "before copulation the male curves his abdomen around beneath, so that the ninth segment of the abdomen is brought into contact with the second, thus transferring the fertilizing fluid to the intromittent organ. The tip of the abdomen of the female is bent around and joins with the underside of the second segment of the male's abdomen, the male frequently grasping the female around the neck with certain appendages at the extremity of his abdomen. This complicated embrace once obtained is likely to be held during the whole process of egg-laying, even in many cases when the deposition takes place under water.

Dragon-flies are semi-aquatic in all their life and habits. The eggs are laid in the stems of submerged plants by some species, which are provided with an instrument for cutting through the bark, each egg being pushed into the cutting as the female moves down the stem. As a rule, however, the eggs are dropped into the water, or

washed off by dipping the tip of the abdomen. The number of eggs laid is large, exceeding 100,000 in the case of many *libellulids*.

When the eggs hatch the young immediately begin a life of activity and depredation. Molts follow one another rapidly, and the first larval form soon changes into a "nymph," a form equivalent to the pupa stage of other insects, but differing in the fact that activity continues. These young remain under water, have short, broad hinder bodies, walking legs, feelers, and breathe by means of "rectal gills." They prey upon everything edible, including their own weaker brethren. To assist them in doing this the mouth-parts are modified into an insect-catching trap, forming an innocent-looking mask, within which are concealed grasping organs, ready to be shot out when an unsuspecting little animal creeps too near and the mask is suddenly lifted. When the broad and flattened nymph has become full-grown it crawls out of the water upon some warm rock, where presently its skin splits open and the adult dragon-fly emerges. These changes are easily studied by breeding dragon-flies in an aquarium.

The voracity of dragon-flies is notorious. They seize and devour all sorts of insects, including smaller species of their own race, and sometimes moths, butterflies and wasps. Flies form their principal fare, however, and they consume vast quantities of house-flies and mosquitoes, but their service in killing the latter pests is mainly done during the larval stages. They abound, in midsummer, in most parts of the world, and sometimes appear in enormous flocks, millions moving across the country in company; such swarms are the result of various local conditions, and are not migrations, properly speaking. The great beauty which most of the species have, glittering in metallic hues and skimming through the sunshine on brilliant, gauzy wings, has made them objects of universal admiration; but this admiration is strangely coupled with a popular fear and superstition toward them. Thus they are commonly known among American children as "devil's darning-needles," and are accused of an intention to sew up the ears of bad boys, or work mischief in the hair of naughty girls. The negroes of the Southern States call them "snake-doctors," and say they feed and nurse ailing serpents. In Great Britain, they are known as "horse-stingers," "flying-adders," or "penny-adders," and are believed to carry a poisonous sting in their tails. All these superstitions are calumnies upon a harmless and beneficial insect.

About 2,000 species of dragon-flies have been described, of which an eighth are peculiar to the United States. The order contains two well-marked groups: the *Libellulida*, or dragon-flies proper, and the *Agriionida*, or damselflies, distinguished broadly by the fact that in the former the front wings are dissimilar, and are held horizontally in repose; while in the latter the wings are alike and are held vertically when the insect rests. Another distinguishing feature is the fact that in the *Libellulida* the eyes are sessile, sometimes meeting on the top of the head, while in the *Agriionida* the eyes are constricted at the base and peduncled. An important subdivision of the *Libellulida*, regarded by some as a separate family, is the *Æschnida*, which is characterized by the fact that the eyes touch on the top of the head. To this group belong many of the largest and most gaudy dragon-flies.

DRAGON ROOT—DRAHMS

An excellent illustrated account of North American dragon-flies will be found in L. O. Howard's 'The Insect Book' (1901), which contains further references. For British species consult Lucas' 'Handbook of British Dragon-flies' (1899).

Dragon Root, or Green Dragon (*Arisæma dracontium*), a plant of the *Arum* family, abounding in wet woods and along streams, from Maine west to Minnesota; and southward to Florida and Texas. The spathe envelops the greenish spadix, the upper part of which tapers into a long, slender appendage, extending beyond the apex of the spathe, sometimes as much as six inches. The corm contains an acrid or pungent sap, which is supposed to possess curative properties, and is much used as a household medicine, in the region of its growth.

Dragon-tree. See DRACENA.

Dragonnades, dräg-ō-nāds', the name given to the persecutions directed against the Protestants chiefly in the south of France, during the reign of Louis XIV. They commenced in Poitou, and their nature may be understood from a letter from Louvois, the French minister, to Marillac, the governor of the province. It is dated 18 March 1681, and says, *inter alia*, that his majesty wishes that the greatest number of troopers and officers be billeted on the Protestants, and that when a just division makes them liable only to 10 they may be saddled with 20. Marillac, thus instructed, lost no time in giving full effect to the letter, and the Protestants were everywhere subjected to cruel extortion and gross indignity at the hands of a brutal soldiery. These dragonnades were practised with still greater atrocity in Béarn 1684, and in all the other provinces where the Protestants existed in any considerable numbers. Resistance was attempted in several instances; thousands of the most enlightened merchants and skilful workmen left the country; carrying their talents and industry into the service of its enemies; but the far greater number, seeing resistance hopeless, and overcome by terror, gave in a feigned adhesion. While the excesses of the dragonnades should be absolutely condemned, it should not be forgotten that the aggressive fanaticism displayed by the Protestant sects in numerous atrocities, to a large extent balance the scale against the cruelties perpetrated in the execution of this measure.

Drag'onet, the common name of certain fishes of the family *Gobiidae* (q.v.). The gemmeous dragonet (*Callionymus lura*), a beautiful fish with a large head and a smooth tapering body, is found in the British seas. See GOBY.

Dragon's Blood, a resinous juice obtained by incision from several different plants found between the tropics;—from the trunk of the *Pterocarpus draco*, a tree of the natural order *Leguminosæ*, growing in the West Indies, which yields American dragon's blood; from the *Calamus draco*, a palm of the East Indies; from a *Dalbergia* in Guiana, and a *Croton* in South America; and from the *Dracana draco* (order *Liliaceæ*), which is most celebrated in connection with the Canary Islands. A historic tree of this last species, at Orotava, acquired enormous dimensions, and was visited and celebrated by almost every traveler, including Humboldt, but was destroyed by a storm in 1867. It was

supposed to have been about 5,000 or 6,000 years old.

Dragon's blood is obtained, in commerce, in three principal forms—in that of oval masses of the size of a pigeon's egg, enveloped with leaves of the pandanus; in cylinders covered with palm leaves; and in irregular masses, marked with impressions of leaves; that in oval masses is the most esteemed.

Dragon's blood is opaque, of a deep reddish-brown color; brittle, and has a smooth and shining conchoidal fracture; when in thin laminae it is sometimes transparent; when burned it gives out an odor somewhat analogous to benzoin; its taste is a little astringent; it is soluble in alcohol, and the solution will permanently stain heated marble, for which purpose it is often used, as well as for staining leather and wood. It is also soluble in oil, and enters into the composition of a very brilliant varnish, which is much esteemed by artists. Its quality may be proved by making marks on paper; the best leaves a fine red trace, and commands a very high price. It was formerly in high repute as a medicine, but at the present time is very little used. An astringent resin, obtained from the *Eucalyptus resinifera* of Australia, sometimes gets the name of "dragon's blood" in that country.

Dragon's Mouths, a strait on the coast of Venezuela, running between the Island of Trinidad and the Paria Peninsula, and leading into the Gulf of Paria.

Dragoon, a mounted soldier, first introduced into the French army about 1585, and trained originally to fight chiefly on horseback, but, if necessary, on foot also, and mounted, armed, and exercised accordingly. Experience proving that they did not answer the end designed, they were hardly ever used in infantry service latterly, and now form a useful kind of cavalry. The term dragoon probably comes from *dragon*, a short species of carbine carried in 1554, on the muzzle of which, from the old fable that the dragon spouts fire, the head of the monster was worked. The first dragoon regiment raised in Great Britain was the Scots Greys (1681). There are at present in the British army three regiments of dragoons, and seven of dragoon guards, all being mounted and accoutred more after the fashion of heavy (or medium) cavalry than the hussar regiments. The three dragoon regiments are the 1st (Royal) Dragoons, the 2d Dragoons (Royal Scots Greys), and the 6th (Inniskilling) Dragoons. Both dragoons and dragoon guards are armed with carbine and sabre, and have metal helmets (except the Scots Greys).

Dragon Bird. See UMBRELLA BIRD.

Draguignan, drä-gên-yän, France, town, capital of the department of Var; 41 miles northeast of Toulon. It was founded in the 5th century. Pop. 8,645.

Drähms, August, American Congregational clergyman: b. Yarmen, Pomerania, 4 March 1849. His parents emigrated to the United States in 1856, and his early education was received in the public schools of Geneva, Ill. In 1863, he enlisted in the 17th Illinois cavalry and served to the end of the War. He afterward studied at Wheaton College, and the Garrett Biblical Institute at Evanston, Illinois,

DRAIN-PIPE — DRAINAGE

and entered the Congregational ministry at Oakland, California, 1878. He is resident chaplain of the state prison at San Quentin, Cal. He has written 'The Criminal: a scientific study; with an introduction by C. Lombroso' (N. Y., 1900).

Drain-pipe, a pipe used in draining, commonly of tile, but sometimes of wood or metal. See **SEWER PIPE**; **TILE**.

Drainage, in agriculture, a method of improving the soil by withdrawing the water from it. Though practised by the Romans, and though the value of draining was expounded by Walter Blithe in the middle of the 17th century, it was not till after the middle of the 18th century that the importance of draining began to be understood in Great Britain. The public attention is said to have been then excited by the practice of Elkington, a farmer of Warwickshire, England. But it was James Smith of Deanston, Perthshire, Scotland, who about 1823 led the way in the modern practice of thorough draining.

The successful practice of draining in a great measure depends on a proper knowledge of the various strata of which the earth is composed, as well as of their relative degrees of porosity, or capability of admitting or rejecting the passage of water through them, and likewise of the modes in which water is formed, and conducted from the high or hilly situations to the low or level grounds. In whatever way the hills or elevations that present themselves on the surface of the globe were originally formed, it has been clearly shown, by sinking large pits, and digging into them, that they are mostly composed of materials lying in a stratified order, and in oblique or slanting directions downwards. Some of these strata, from their nature and properties, are capable of admitting water to percolate or pass through them, while others do not allow it any passage, but force it to run or filtrate along their surfaces, without penetrating them in any degree, and in that way conduct it to the more level grounds below. There it becomes obstructed or dammed up by meeting with impervious materials of some kind or other, by which it is readily forced up into the superincumbent layers, where they happen to be open and porous, soon rendering them too wet for the purposes of agriculture; but where they are of a more tenacious and impenetrable quality, they only become gradually softened by the stagnant water below them; by which the surface of the ground is, however, rendered equally moist and swampy, though somewhat more slowly than in the former case.

Where grounds are in a great measure flat, and without degrees of elevation sufficient to permit those over-proportions of moisture that may have come upon them from the higher and more elevated grounds to pass readily away and be carried off, and where the soils of the land are composed or constituted of such materials as are liable to admit and retain the excesses of moisture, they are exposed to much injury and inconvenience from the retention and stagnation of water. Such lands consequently require artificial means to drain and render them capable of affording good crops, whether of grain or grass.

Wetness of land, so far as it respects agriculture and is an object of draining, may gener-

ally depend on the two following causes:—first, on the water which is formed and collected on or in the hills or higher grounds, filtrating and sliding down among some of the different beds of porous materials that lie immediately upon the impervious strata, forming springs below, and flowing over the surface, or stagnating underneath it; and, secondly, on rain or other water becoming stagnant on the surface, from the retentive nature of the soil or surface materials, and the particular nature of the situation of the ground. The particular wetness which shows itself in different situations, in the forms of bogs, swamps, and morasses, for the most part proceeds from the first of these causes; but that superficial wetness which takes place in the stiff, tenacious, clayey soils, with little inclination of surface, generally originates from the latter.

Drains.—The drains used in land drainage may be divided into two classes—open and covered drains. These again may each be subdivided into drains intended merely to act as water-courses, and drains which, in addition to acting as water-courses, are also intended to carry off the surplus water from the land through which they pass.

Open Drains.—The rudest forms of open drains are the deep furrows, lying between narrow highbacked ridges, which are still to be found in some parts of the country, with their accompanying water-furrows ("gaw" furrows or "grips") for discharging their streams. These are only meant to carry off the surplus water after the soil is completely saturated. In doing so, however, they carry along with it all the best portions of the soil, and of the manure which may have been spread upon its surface.

Open Drains as Water-courses.—The ordinary ditch (dike) is the common form of this kind of drain, which, though necessary to a certain extent, ought, nevertheless, to be sparingly seen where a perfect system of drainage has been effected. They are constant sources of annoyance and expense from their sides crumbling in, the numerous weeds which they harbor, and the thorough scouring which they require every year. Open ditches occupy an important place in the early stages of draining bogs; but after the bog has become consolidated the greater portion of them may be dispensed with, and their places supplied by large covered drains.

Open Drains for collecting Water from the Land through which they pass (Sheep-drains).—These are employed in drying the surface of mountain pastures, where a more expensive and perfect system of drainage would not yield an adequate return for the outlay. They consist of trenches of 12 or 16 inches in depth and 18 in width, placed so as to intercept all the water which may flow from portions of land above them. They are opened at intervals in a direction nearly transverse to the line of the greatest slope, and should have just sufficient inclination to keep the water flowing toward the mains or leaders. These latter should be cut in the hollows, or in such other places as will permit the small drains or feeders to empty themselves most readily into them, and be made to discharge into the nearest water-courses.

Covered Drains.—We now come to the consideration of the more important description of drainage—the removal of water by means of

DRAINAGE

covered drains. The simplest of all the forms of these are what are called mole-drains, and they are formed by means of a machine called the mole-plough. This machine consists of a wrought-iron frame on four wheels, the front pair being connected with worm and chain steering. A coulter with pointed sock, capable of being raised and lowered to regulate the depth of the drain, is attached to the frame. The "mole," an oval piece of iron $3\frac{1}{2}$ inches in diameter, follows the sock, to which it is attached by a short chain. The track which the mole leaves in the ground is the water channel. This machine is dragged through the soft clay, which is the only kind of land on which it can be used with propriety, by means of a windlass on the fore end of the frame and a double length of wire-rope wound by an engine on the higher part of the field. A team of horses returns it to the lower side, out of work.

Wedge-drain.—The wedge-drain, like the mole-drain, is merely a channel formed in the subsoil, and, like it, can only be used in pasture lands. In forming wedge-drains, the first spit, with the turf attached, is laid on one side, and the earth removed from the remainder of the trench is laid on the other. The last spade that is used is very narrow, and tapers rapidly, so as to form a narrow wedge-shaped cavity for the bottom of the trench. The turf first removed is then cut into a wedge, so much larger than the size of the lower part of the drain that, when rammed into it with the grassy side undermost, it leaves a vacant space somewhat triangular in shape in the bottom of six or eight inches in depth.

Permanent drains are of two kinds, stone and tile drains.

Stone-drains.—These are either formed on the plan of open culverts of various forms, or of small stones in sufficient quantity to permit a free and speedy filtration of the water through them. As a specimen of the former of these, we may instance the *box-drain*, which is formed of flat stones neatly arranged in the bottom of the trench. The largest and flattest stones are used in laying the bottom and for covers; the smaller ones are placed on the sides, the whole forming an open tube. The second description of stone-drains, generally known as the broken-stone or rubble drain, is not so thoroughly effective as the first.

Tile-drains or Sewer-pipe drains.—Of all the materials which have yet been brought forward for forming the conduits of drains, none are so well fitted for the purpose as tiles or pipes of burnt clay. Draining tiles, especially those in the form of pipes, possess all the qualities which are required in the formation of drains, affording a free ingress to water, while they effectually exclude vermin, earth, and other injurious substances. When first introduced they were of clumsy construction, and being hand-made, sold at a high price. They are now made by machinery, and their expense is very materially lessened. Pipe tiles, which combine the sole and cover in one piece, have been made of various shapes, but the best form appears to be the cylinder. Good pipes are straight, smooth, and free from flaws, and when struck should ring clearly. Durability is shown if the wet pipe will dry quickly before a hot fire without crumbling. Where a sudden descent occurs in the course of a drain, or where there is a run-

ning sand or a boggy place, pipes of one size should either be entirely sheathed in larger ones, or they should be furnished with collars. These collars are merely short sections of pipes of such a size as to fit upon smaller ones, by which means the smaller ones may be so joined end to end as to prevent them from slipping down past each other.

The drawing off of the pent-up waters which are the sources of springs is a department of draining which requires, for its successful practice, a considerable knowledge of the different varieties of strata. When the theory of springs is understood, and a knowledge of the strata obtained, the judicious application of a few simple drains, made to communicate with the watery layers, will often dry swamps of great extent, where large sums of money expended in forming furrow drains in the swamp itself, would leave it but little improved.

In the laying out of drains, the first point to be determined is the place of outfall, which should always afford a free and clear outlet to the drains, and must necessarily be at the lowest point of the land to be drained. This should be ascertained by a beveling instrument; and where a large extent of work is to be done, a competent surveyor should always be employed. The outfalls should be as few as possible, and each one should be carefully set in brickwork and covered by a grid hinged at the top to prevent the ingress of rats and moles, but capable of giving way to a sudden rush of water from the drains above. The next point to be determined is the water level or water table. This may be ascertained by digging test holes in different parts of the field and noticing the height to which the water rises in them. In an undulating field the height will vary in different places, but the knowledge gained by means of the test holes of the nature of the soil and subsoil will indicate the depth of draining required. In general it will be found that in clay land the drains should be shallow and close together, and in sandy or light land deeper and wider apart; the looser nature of the lighter soil permitting the rapid percolation of water, and allowing the drains to draw from a wider area. Drains in arable land must be beyond the influence of agricultural implements; not only out of the reach of plough or cultivator, but too deep to be displaced by their passing weight. Less than two feet six inches from the surface is unsafe, except in very stiff clay pasture land which is never disturbed. The depths usually adopted in practice for the various classes of soils are as follows:

Stiff clay.....	2 ft. 6 in. to 3 ft.
Medium soils.....	3 ft. 3 in. to 3 ft. 6 in.
Light soils.....	3 ft. 6 in. to 4 ft. 6 in.

As to the distance apart, experience has established a rule that in clay soils a drain will "draw" an area of from 5 to 6 times its depth, on medium soils 7 to 9 times, and on light soils 8 to 10 times its depth. Thus 3-foot drains in the first case might be 15 feet apart, in the second 24 feet, and in the third 40 feet apart. Submains may be necessary in an undulating field, and in all cases they are desirable where the minor drains would otherwise be more than 10 chains in length. The rate of fall of any drain must not be less than 1 in 200. All drains should be kept as far as possible from

DRAINAGE

the roots of trees, and curves are to be avoided, except at the junction of minor with main drains or submains, when the junction must form an acute angle, the smaller drain curving towards the larger drain and entering it from above. Two minor drains must not enter a large drain opposite to each other, or the stoppage thus caused will result in the deposition of silt and consequent chokeage of the drain.

Drains are cut from the lowest point upward and the pipes laid in each section day by day. To ascertain if the pipe bed is being laid perfectly true, three leveling staves or "boning" rods are used. Each consists of a staff and crosshead, and by placing them at various points in the drain and sighting over the crossheads, uniformity of the bed is determined. The surface soil in cutting the drains ought to be laid on one side of the trench and the subsoil upon the other side, and each should be returned carefully to its original position. The size of the pipes to be used is dependent upon a number of factors, such as character of soil and subsoil, gradient, rainfall, and length of drains; but in practice it is found most profitable to use $2\frac{1}{2}$ -inch to 3-inch pipes for minor drains, and 6-inch, 8-inch, or 10-inch for mains and submains. The number of pipes required per acre is found by dividing the area of an acre in square feet by the distance between the drains in feet, provided the pipes are one foot in length. The following table will be of value in this particular:

Minors	{	Lengths up to 500 feet, 2 in.
		Lengths 400 to 700 feet, $2\frac{1}{2}$ in.
		Lengths 500 to 1,000 feet, 3 in.
Mains	{	2 to 3 acres.... 3-inch tiles.
		4 to 6 acres.... 4-inch tiles.
		10 to 15 acres.... 6-inch tiles.
		20 to 40 acres.... 8-inch tiles.
		40 to 100 acres.... 10-inch tiles.

The tools used in the formation of drains are few in number, and of a very simple description. They consist of a set of spades—generally three of different sizes—gradually diminishing in width to suit the different parts of drains. For taking out the last narrow spit, to form the seat for the draining pipe, long, narrow, triangularly shaped spades, called bottoming tools, are used. There are also scoops of various widths, furnished with long handles, and rounded or flattened in the soles according as they are required to finish the bottom of the drain for the reception of stones, a horse-shoe tile and sole, or a draining pipe. For the purpose of laying pipes in minor and deep drains an instrument called a pipe-layer, consisting of a short rod attached at a right angle to a long handle, which enables the workman to lay the pipes without going into the drain or reaching the bottom with his hand, is employed. Where the subsoil is strong or indurated, a hand-pick or a foot-pick is required to loosen it before it can be shoveled out.

Benefits of Drainage.—The following are among the benefits arising from thorough drainage:

1. Removal of superfluous water. Not only is the standing water at the surface carried off, but the water-table is lowered, increasing the depth of soil. Energy that would otherwise be required for evaporation of water is thus saved for the immediate benefit of vegetation.

2. Improves soil texture. Drained soils are

more friable, less lumpy, offer less resistance to plant roots, and are of better texture in every way, than undrained soils.

3. Increases root pasturage. Agricultural literature is full of testimony to the benefits of deep tillage. The deeper the soil is stirred the greater its productiveness. Plant roots penetrate to a depth of several feet under favorable conditions such as drainage supplies. Root pasturage is also increased by the increase of surface presented by the much finer division of soil particles.

4. Increases soil fertility. It prevents loss of fertility by water passing over the surface. It adds to the fertility by sending summer showers down through the soil, instead of over them, enabling the crop to use the nitric acid and ammonia brought down. It increases the effect of manures by bringing them more quickly into solution and into more intimate contact with plant roots; and it increases the absorptive power of soils for fertilizing matter in solution.

5. Makes tillage easier. By clearing up waste places and covering ditches the field is brought into better shape for use of labor-saving machinery. Waste land is reduced, and the better texture of soil, its finer tilth and greater friability decrease draft and increase the effectiveness of tillage implements.

6. Lengthens the growing season for crops. Frost comes out earlier in the spring and the land becomes earlier warmed. Evaporation lowers temperature, but drainage removes water without evaporation. A well-drained soil is 12° to 14° F. warmer than a soil full of stagnant water. The sun's rays penetrate to a greater depth, and warm summer showers have a greater effect. The season is lengthened by adding the days in summer after heavy rains when undrained soils cannot be tilled, and crops come to a standstill; coming of the autumn is delayed until later, and the soils are warmer throughout the season.

7. Assists disintegration. Frosts penetrate deeper in winter in drained soils, assisting in unlocking the stores of mineral plant food. More surface is exposed to the action of disintegrating agents, and the soil presents conditions more favorable to their action throughout the season.

8. Favors nitrification and bacterial action. Plants are largely dependent on the decomposition of organic matter in the soil for their supply of nitrogen. This change is brought about by the action of ferments or bacteria which thrive only under certain conditions of temperature and moisture. Drainage supplies the most favorable condition for their development; it also favors the growth of the nitro-bacteria found on the roots of leguminous plants, which by their means appropriate free nitrogen from the air.

9. Prevents heaving. The effect of stool-ice in throwing out young plants in winter is often to diminish seriously and even destroy the crop. Drainage dries up the surface soil and prevents the formation of stool-ice.

10. Lessens washing and diminishes violence of floods. By increasing the absorptive power of the soil less water is left to pass over the surface in a rainy season, so that washing and floods are materially lessened.

11. Improves the quantity and quality of

DRAINAGE TUBES — DRAKE

crops. That the yield of crops is much greater on drained soils hardly needs to be substantiated, while the more vigorous growth of plants renders them much less susceptible to the attacks of fungi or the ravages of insects, thus improving the quality. Rust, mildew, blight, etc., are much less prevalent in crops on drained soils.

12. Diminishes the effect of drought. By making the season earlier tillage can begin sooner and save moisture from wasting. Plants are given a better start and root deeper, thus being less affected by a dry surface. The soil is deeper and has greater capacity for moisture. Its finer texture nearly doubles its capillary power over undrained soils. Ordinarily drainage increases the capillary power of soils from 25 to 40 per cent. A drained soil holds water like a sponge, an undrained clay like a dish.

13. Healthfulness improved. So well known is this fact that large towns have undertaken the drainage of adjacent swamps at public expense to render the region more healthful. See AGRICULTURE; SANITARY SCIENCE; etc.

Among the later authoritative books on drainage: Chamberlain, 'The Draining'; Klippart, 'Land Draining'; French, 'Farm Draining'; Miles, 'Land Draining'; Waring, 'Draining for Profit and Health.'

Drainage of Mines. See MINES, DRAINAGE OF.

Drainage Tubes, in surgery, an appliance invented by a distinguished French surgeon, M. Chassaignac. They are composed of india-rubber, from one eighth to three eighths inch in diameter, perforated with numerous holes, and of various lengths. They are introduced into the abscess or wound so that one end is in contact with the seat of discharge, while the other reaches to the surface of the skin. They are especially useful in chronic abscesses, but also in large wounds, such as those made by amputation, and in all cases where there is apt to be a deep accumulation of discharge.

Drake, Alexander Wilson, American artist: b. near Westfield, N. J., in 1843. He became a wood engraver and later taught drawing at Cooper Union, New York. From 1870-81 he was head of the art department of 'Scribner's Monthly' and after 1881 was director of the art department of the 'Century' publications.

Drake, Benjamin, American biographical writer: b. Mason County, Ky., 1794; d. Cincinnati, Ohio, 1 April 1841. He established and for many years edited the 'Western Agriculturist.' Among his publications are: 'Adventures of Black Hawk' (1838); 'Life of William Henry Harrison' (1840); and 'Life of Tecumseh' (1841). The last work is considered of especial historic value.

Drake, Charles Daniel, American lawyer: b. Cincinnati, 11 April 1811; d. 1 April 1892. He served several years in the navy, was admitted to the bar in 1833, and in 1834 took up the practice of law in St. Louis, where he became prominent in politics. In 1864 he was a member of the convention to revise the Constitution of Missouri; in 1867-71 he was United States senator; and in 1871-85 chief justice of the court of claims. He wrote 'Law of Suits by Attachment' (1854); 'Life of Daniel Drake' (1871); and published a collection of his

speeches under the title 'Union and Anti-Slavery Speeches' (1864).

Drake, Daniel, American physician: b. Plainfield, N. J., 20 Oct. 1785; d. Cincinnati, Ohio, 6 Nov. 1852. He was graduated from the University of Pennsylvania in 1815, and settled for a time in Cincinnati. He was professor of materia medica in Transylvania University, Ky., and taught in other medical schools till 1820, when he organized the Medical School of Ohio in Cincinnati; he was professor there, and in the University of Louisville, Ky. He wrote 'Pictures of Cincinnati and Miami County' (1815); 'Practical Treatise on the History, Prevention and Treatment of Epidemic Cholera' (1832); 'Systematic Treatise on the Principal Diseases of the Interior Valley of the North America' (1850-4); and was editor of the 'Western Medical and Physical Journal.'

Drake, Sir Francis, English navigator: b. probably in Tavistock, Devonshire, England, about 1540; d. off Porto Bello 28 Jan. 1596. He joined Sir John Hawkins in his last expedition against the Spaniards (1567), losing nearly all he possessed in that unfortunate enterprise. Having gathered a number of adventurers round him he contrived to fit out a vessel in which he made two successful cruises to the West Indies in 1570 and 1571. In 1572 with two small ships he again sailed for the Spanish main, captured the cities of Nombre de Dios and Vera Cruz, burned Porto Bello, captured and destroyed many Spanish ships, crossed the isthmus to the highest point of the dividing ridge, where, climbing a tree from whose tops the guides told him both seas could be seen, he gazed upon the vast waters of the South Seas, and with that touch of romantic enthusiasm that redeemed all his piracies, "besought Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea." Drake arrived in Plymouth on Sunday, 9 Aug. 1573, during sermon-time, when the news of his return "did so speedily pass over all the church, and surpass their minds with desire and delight to see him, that very few or none remained with the preacher, all hastening to see the evidence of God's love and blessing toward our gracious queen and country."

In 1577 he fitted out a small squadron, consisting of his own ship the Pelican, the Elizabeth and three smaller vessels, and with these sailed from Plymouth on 13 December. On 20 August the squadron, now reduced to three ships, entered the Strait of Magellan, and here Drake changed his own ship's name from the Pelican to the Golden Hind. In 16 days they made the passage, then followed violent tempests for 52 days, during which the Marigold foundered with all hands and the Elizabeth parted with the admiral and resolved to return home. At Valparaiso Drake provisioned his ship from the Spanish storehouses, reached Callao on 15 Feb. 1579, found a rich prize off Cape Francisco (1 March) and another on 4 April. Drake now determined to return home by crossing the Pacific. He touched land at a creek on the northern side of the Golden Gate, then for 68 days together had no sight of land until he made the Pelew Islands. After refreshing three weeks at Ternate, and a thorough refit on the southwest coast of Java, he held for the Cape of Good Hope, and arrived in England 26 Sept. 1580.

DRAKE

The queen paid a visit to his ship at Deptford, and knighted him on its deck.

In the autumn of 1585 Drake sailed with a fleet of 25 ships against the Spanish Indies, harrying Hispaniola, Cartagena, and the coast of Florida, and brought home the 190 dispirited Virginian colonists, with tobacco and potatoes. Early in 1587 he set sail with a strong squadron to cripple the king of Spain in his own seas, and retard his preparations for invasion—a sport which he called “singeing the king of Spain’s beard.” Sailing right into the harbor of Cadiz, he sank or burned as many as 33 ships, and made his way out unscathed. The seeming recklessness of his tactics was no devil-may-care bravado, but due to consummate seamanship no less than promptitude and courage. Drake next sailed to the Azores, capturing a rich homeward-bound Portuguese carack worth £100,000. In the face of the impending struggle for which Philip II. had long been preparing, his persistent plan was to follow up the policy of harassing the enemy on his own coasts—“to seek God’s enemies and her majesty’s where they may be found.”

Drake’s division in the three-fold arrangement of the English fleet was at first stationed off Ushant, until all the ships were blown together to Plymouth by the same storm that carried the Spaniards across the Bay of Biscay. Here, on the Hoe, the admirals and captains were playing the famous game of bowls, when the news was brought that the enemy was off the Lizard. Howard was eager to put to sea at once, but Drake would first finish the game, saying “there’s plenty of time to win this game, and to thrash the Spaniards too.” The story, whether true or no, is in perfect keeping with the character of the man. Early next morning the battle began, and raged along the Channel throughout the week. Drake’s consummate seamanship and audacious courage covered him with fresh glory, and inspired new terror in the Spaniards. On 29 July occurred the final action so disastrous to the Spaniards, after which they came to their fatal determination to return to Spain round the Orkneys. Two days later Drake wrote to Walsingham: “There was never anything pleased me better than the seeing the enemy flying with a southerly wind to the northward. God grant you have a good eye to the Duke of Parma, for with the grace of God, if we live, I doubt it not, but ere it be long so to handle the matter with the Duke of Sidonia, as he shall wish himself at Saint Mary Port among his orange trees.” It was not long before want of ammunition compelled Drake and Howard to fall back from the chase, but the storms of the northern seas took up their work and swept the Spaniards to destruction. Next spring a great expedition under him and Sir John Norreys sailed for the coasts of Spain and Portugal, but had little success beyond the damage inflicted upon the Spanish shipping, while sickness and actual hunger carried off thousands on board the crowded and ill-victualled ships. In August 1595, he sailed from Plymouth on his last expedition to the West Indies. Ill-fortune followed the fleet from the beginning; Hawkins, the second in command, died off Porto Rico in November, and Drake himself fell ill and died off Porto Bello. See the *Life* by Barrow (1843); Froude, ‘English Seamen of the 16th Century’ (1895);

Julian Corbett, short *Life* (1890); and his ‘Drake and the Rise of the Tudor Navy.’

Drake, Francis Marion, American capitalist and lawyer: b. Rushville, Ill., 30 Dec. 1830; d. Centreville, Ia., 20 Nov. 1903. In 1837 his family moved to Iowa, where he was educated. In 1852 he crossed the plains to California with ox-teams, encountering and defeating a band of Pawnee Indians on the route, and in 1854 crossed again with a drove of cattle. In 1855 he engaged in mercantile business in Drakeville, Ia., and in 1861 entered the army as a private. He served through the Civil War, attaining the rank of brigadier-general of volunteers. After the war he studied and practised law, and engaged in the railroad business, particularly the building of new roads. He was the first president of the Missouri, Iowa & Nebraska R.R., and was later president of the Albia & Centreville R.R. In 1880 he founded Drake University (q.v.) which he liberally endowed, and was president of the board of trustees till the time of his death. He was one term (1896-8) governor of the State of Iowa, being elected on the Republican ticket.

Drake, Francis Samuel, American historical writer: b. Northwood, N. H., 22 Feb. 1828; d. Washington, D. C., 22 Feb. 1885. He was a son of S. G. Drake (q.v.). He prepared a ‘Dictionary of American Biography’ (1872). He also published: ‘Life of Gen. Henry Knox’ (1873); ‘Tea Leaves’ (1884); and ‘Indian History for Young Folks’ (1885). Before his death he had gathered material for a new edition of his ‘Dictionary,’ which was incorporated in ‘Appleton’s Cyclopædia of American Biography.’

Drake, Friedrich, frēd’rīn drä’kē, German sculptor: b. Pyrmont, 23 June 1805; d. Berlin, 6 April 1882. Among his principal works are ‘The Eight Provinces of Prussia’ (colossal allegorical figures adorning a hall in the royal palace at Berlin), and a ‘Warrior crowned by Victory,’ which is reckoned one of the masterpieces of German sculpture.

Drake, James Madison, American journalist and soldier: b. Somerset County, N. J., 25 March 1837. He early engaged in newspaper work and served in the Union army throughout the Civil War, unfurling the first Union flag on Virginia soil 24 May 1861. After the war he settled in Elizabeth, N. J., and published there the *Daily Monitor* (1868-81), the ‘Sunday Leader’ (1882-7), and *Daily Leader* (1887-1900). He has written: ‘Fast and Loose in Dixie’ (1880); ‘Across the Continent in Red Breeches,’ etc.

Drake, Joseph Rodman, American poet: b. New York 7 Aug. 1795; d. there 21 Sept. 1820. He studied medicine, traveled in Europe, and after his return in 1819 contributed under the signature of “CROAKER” many pleasant and effective verses to the New York *Evening Post*. His friend Fitz-Greene Halleck joined him in this series, signing his own pieces at first “Croaker, Jr.,” but soon they both adopted the signature of “Croaker & Company.” The novelist Cooper was also one of the intimate associates of Drake and a conversation between them as to the poetical uses of American rivers, in the absence of historical associations, such as belong to the streams of the old world, was the occasion of Drake’s longest and most imaginative poem, the ‘Culprit Fay.’

DRAKE—DRAMA

Drake, Samuel Adams, American journalist and writer; b. Boston, 20 Dec. 1833. He is a son of S. G. Drake (q.v.). He entered journalism in 1858. In 1861 joined the army and served throughout the War, becoming brigadier-general in 1863. He returned to Boston in 1871 and resumed literary work. His most important publications are: 'Old Landmarks of Boston' (1872); 'Around the Hub' (1881); 'New England Legends' (1883); 'New England Legends and Folk Lore' (1884); 'The Making of New England' (1886); 'The Pine Tree Coast' (1891); 'Our Colonial Homes' (1894); 'The Border Wars of New England' (1897); 'The Myths and Fables of To-day' (1900), etc.

Drake, Samuel Gardner, American antiquarian; b. Pittsfield, N. H., 11 Oct. 1798; d. Boston, Mass., 14 June 1875. He published 'Indian Biography' (1832); 'Book of the Indians' (1833); 'The History and Antiquities of Boston' (1856); 'History of the French and Indian War' (1870), etc.

Drake University, a coeducational institution in Des Moines, Ia.; founded in 1881, under auspices of Church of Christ. Named for Gen. Francis Marion Drake, its chief benefactor, whose gifts amounted to \$230,000, and who served as president of the board of trustees from the board's organization until his death, 20 Nov. 1903. Linked with the name of Drake as founder, is the name of D. R. Lucas, through whose influence the institution was located in Des Moines, and that of George Thomas Carpenter, its first chancellor and the moving spirit of the new enterprise. Total assets of the university, \$530,000. Available income about \$90,000 annually. There are eight organized colleges: Liberal arts, Bible, law, medicine, normal, conservatory of music, pharmacy, dentistry. Also eight special schools. Enrollment for year 1903-04 was 1,507. General control is vested in board of trustees, composed of (1) life members; (2) members elected by Iowa Christian Convention; (3) members elected by Alumni Association. President of the university, under direction of board, is head of the school.

Drama, a term taken from the Greek, literally signifying action, and applied to that form of literature intended primarily for presentation upon the theatrical stage. A production may be dramatic in form, and yet through lack of conformity, intentional or otherwise, to theatrical requirements, may belong to the class known as closet dramas. Dramatic literature during the greater part of its history has constituted one of the three great classes of poetry, epic and lyric verse being the other forms; but modern usage admits of prose as a vehicle of expression in the drama. The drama is commonly divided into two great branches, tragedy and comedy,—the former presenting the serious problems of human character and conduct, with deeds and circumstances trending toward a fatal issue; the latter depicting the bright and humorous side of life. Dramatic performances of some kind have been known probably among all nations, and seem generally to have been connected in their origin with religion. Compositions of a dramatic nature are found in the Old Testament, for example, in Job and the Song of Solomon.

Oriental Drama.—The forms of national drama developed in India and in China are

worthy of note among Oriental literatures. Chronologically they follow the drama of Greece, but lack the historic connection with modern drama, characteristic of the latter, and may be regarded independently. The Hindu drama, like the Greek, grew out of certain features of religious festivals, but contrasts strikingly with it in the lack of tragedy. The most famous specimen of Hindu dramatic literature is the 'Sakuntala' ('The Lost Ring') a seven-act drama by Kalidasa, the greatest of Hindu dramatists, and celebrates a romantic love episode. The date is uncertain, but the tendency of modern critics is to place the era of Kalidasa at least as late as the 4th century of the Christian Era. Another play by the same author is 'Vikramorvasi' ('The Hero and the Nymph'). In China the flourishing period of the drama appears to have been from the 13th to the 14th century. Chinese plays are very formal. They represent both humorous and heroic situations, but cannot strictly be divided into comedy and tragedy.

Greek Drama.—Incomparably the most interesting ancient dramatic literature is that of Greece, both for its intrinsic value and because of its relation to the drama of other European countries. At first the drama among the Greeks was by no means so distinctly separated from the epic and lyric poetry as we find it at a later period. Both forms, tragedy and comedy, took their rise in the celebrations of the festivals of the god Dionysus (Bacchus), at which hymns and chants were sung by choruses in honor of the deity; and the chorus continued to be a prominent feature of the old Greek drama. Tragedy is generally ascribed to Thespis about 530 B.C. No specimens of the earliest age of Greek drama, that is to say, of the compositions, either purely dithyrambic or consisting of choric songs interspersed only with monologue, which are supposed to have prevailed in the infancy of the art, now survive. The earliest examples, the dramas of Æschylus, whose chief predecessors were Phrynichus, Chœrilus, and Pratinas, exhibit the drama in a very advanced condition, so far as the particular style goes. Though in the earliest examples not more than two actors were permitted to be present as speakers on the stage at the same time, the dialogue is managed so as to unfold a varied and completely dramatic story; while the chorus, either as a whole or subdivided into sections, performs its lyrical odes, and, when necessary, takes part by its leader, and rarely by other members, in the spoken portions. The almost immediate addition of a third speaking actor, which, whether due to Æschylus himself or not, appears in his later plays, is practically the only change of importance subsequently made; and this was not as a rule further extended in Greek tragedy, that is to say, in the works of the three great writers, Æschylus, Sophocles, and Euripides. Very rarely the *quarta persona* or something like him appears, but this is a mere exception, and unimportant. The plays were for the most part, arranged in trilogies or sets of three, sometimes followed by a fourth play of a quite distinct and comic or satiric character. With each new play the restrictions of the unities were relaxed, or rather disappeared altogether, and a fresh time, a fresh place, and an only distantly connected scheme of action could be entered upon. These unities, which at various times have been the subject of sharp contro-

DRAMA

versy, appear to be less *à priori* rules which the authors had before them than generalizations deduced and formulated from the practice of these authors. Some slight and some serious deviations from them have been observed, but on the whole they were rigidly observed. Generally speaking, the unity of time rules that not more than 24 hours are to be supposed to pass; the unity of place, that the scene shall not be changed; and the unity of action, that nothing like an independent underplot shall be permitted, every incident, and practically every speech, being subordinated to the main argument. When these strict conditions were taken with the exact and (in the case of the choruses) intricate metrical structure of the verse, they set Greek tragedy at the head of all literary performances as an example of exquisite symmetry of form, severe in its proportion. It is, however, almost as remarkable that, at least in Æschylus and Sophocles, no deficiency of dramatic interest attends this severity of form. Euripides is in this respect far inferior. Even in the earliest examples the metrical arrangements are consummate. The magnificent poetical quality of Æschylus, the sense of overmastering fate with which he manages to charge all his drama, and the perfect humanity of Sophocles, relieve their work entirely from the charge of sterility which has been brought against more modern imitations of their form. The subjects of Greek tragedy were limited to poetical and heroic tradition, with a certain admixture of what in modern literature we should call the chronicle-play, or drama of contemporary event. The extant example is the 'Persæ' of Æschylus; an exceedingly interesting play, because it shows the ease with which the Greeks could achieve what has baffled almost all moderns. Greek comedy is supposed to have commenced about 580-560 B.C. with Susarion, who is said to have traveled from place to place holding up to ridicule, on a small movable stage, the follies and vices of his age. By degrees the lyric element in comedy gave way to the dramatic, and the comic drama assumed the form familiar to us from the plays of Aristophanes (q.v.), whose 'Knights' appeared probably about 424 B.C. If it were not for the limitations of the female characters which Greek manners necessitated, Aristophanes would perhaps have been the equal of Shakespeare in comedy. As it is, he is unequalled in the class to which belong, with the play just mentioned, 'The Frogs' and 'The Clouds.' The old comedy of the Greeks was thoroughly national, with much of a political tendency. At the end of the Peloponnesian war (404 B.C.), Greek comedy received a new character and form, and "middle comedy," so called, began. It was strictly forbidden to bring living persons by name on the stage, and the chorus, till then the chief instrument of vituperation, was abolished; while, with the representation of general characters, corresponding masks were introduced, instead of those imitating the countenances of particular individuals. Even Aristophanes was obliged to submit to these regulations in his last plays. To the new comedy of the Greeks, which formed the next development, belongs Menander, 342-291 B.C., who by the keenness of his wit and the regularity of his pieces began a new period, the Greek comic drama. It may be said in general that Greek genius elaborated the stock comedy of certain general types of

character, so that in spite of great changes in manners, no original addition has since been made with the exception of what was contributed by Molière.

Roman Drama.—The Latin race, lacking the æsthetic temperament that distinguished the Greeks, accomplished little of importance in dramatic literature. The Romans as a people found more attraction in pantomimic shows and such spectacles as gladiatorial contests and the games of the circus than in the drama. The earliest specimens of the drama in Italy were the Atellan plays, so called from Atella, a city of the Oscans. These were farces or pieces in which broad buffoonery prevailed. The regular drama among the Romans was a mere imitation of that of the Greeks, Livius Andronicus, Ennius, and Pacuvius being the earliest writers of Roman tragedy. Plautus and Terence, a number of whose plays have come down to us, were imitators of the new Greek comedy. Their works have been the basis of many modern imitations or adaptations. The plays of Terence are distinctly literary works, probably following as closely as was feasible the Greek originals. The work of Plautus, although perhaps scarcely less indebted to Greek comedy for plots and incidents, displays a strong infusion of vernacular character with more of a distinctly Roman flavor to the humor. The fault of Terence's work is thinness; of that of Plautus, coarseness. Of Roman tragedy, the dramas attributed to Seneca are the only specimens extant. They are pretty obviously closet drama, that is, whether they were ever acted or not they were written as literature and not as playwright's work. Their importance lies in their influence upon the tragedy of the Renaissance. Italy and France felt that influence deeply, and if English taste had welcomed the innovation the stamp of Seneca would have been placed upon her literature also.

Drama of the Middle Ages.—The early Dark Ages produced nothing worth speaking of, while the Terentian comedies of the nun, Roswitha (q.v.), stand by themselves, and are little more than literary *pastiches*. Such dramatic entertainments as survived were attacked by the clergy as heathenish, immoral, and indecent exhibitions. When the drama reappears, it is connected as before with the offices of religion, though the precise extent to which this connection reached is a matter of much debate. About the 11th century in France appear the beginnings of the famous miracle or mystery play, which has sacred subjects only, is in its earliest forms very short, and consists for the most part in the representation "by personages," as the vernacular phrase went, either of scenes from the Bible or of legends of the saints. This kind of drama, which is still represented in a modified form by the famous Ammergau passion-play, was extremely popular; and though later in other countries than in France, has tolerably early representatives in most of them, especially in Germany and England. France, however, was its special home. As early as the 13th century a single French author, Adam de la Halle, originated, so far as is known, two important styles, the comic opera (in 'Robin et Marion') and the modern comedy, in the half autobiographic composition called the 'Jus' ('Jeu,' 'game') 'Adam' or 'Jus de la Feuillie' ('of the booth'). Of these compositions the former has hardly a trace of roughness, while the latter

DRAMA

contains no hint of classical inspiration. By the 14th century France had added to the miracle or mystery, which branched out into the "profane mystery" or chronicle-play dealing with current events or ancient history, not merely the farce—the dramatization of the earlier verse *fabliau* or comic story, and the "morality"—an allegorical play of virtues, vices, and the life of man generally, to which the general mediæval passion for allegory gave great vogue; but also the *sotie* or political farce, as well as not a few minor varieties. The passion for dramatic entertainments was very great and societies or guilds existed for their performance.

Italian Drama.—Great as are the performances of Italy in European literature, her achievements in drama are of little moment, when compared with the towering fame of Dante and Petrarch, of Ariosto and Tasso. Her chief influence was to direct France into following the Senecan tragedy, and, through a writer who took the French name Larivey, but who was really a Giunti, the Terentian comedy somewhat relaxed. No Italian mediæval work for the stage is in the least remarkable; but as soon as the Renaissance dawned, certain writers, Trissino especially, adopted the stiff form of tragedy already referred to, the earliest noteworthy tragedy in Italian being his 'Sofonisba' (1515). Macchiavelli, Cardinal Bibbiena, and the great Ariosto, attempted comedy. The Italian pastoral drama sprang from the ancient idylls, and aimed at a fanciful delineation of Arcadian and mythological scenes. It gave birth to the lyrical drama, which under the name of opera, was from Italy to conquer Europe, and to push drama proper much out of favor. It was a little restored by a group of learned writers in the late 17th century, the chief of whom was the Marquis Maffei, a soldier, an antiquary, and a playwright, whose 'Merope' Voltaire followed very closely. Goldoni and Gozzi started the school of comedy which was to a great extent a reflection of national manners, and has real distinction. Whether as much can be said of the formal lyric dramas of Metastasio in the middle, or of the tragedies of Alfieri at the end of the 18th century, is perhaps a matter of taste. In spite of the high rank that has been accorded the latter, neither he nor any other writer of Italy has succeeded in drama, since the school of Venetian comedy, in striking what may be called an original note, though during the 19th century Manzoni and others attempted the style.

Spanish Drama.—In Spain, no mediæval performances of much merit are cited by historians; but instead of being diverted by the Renaissance into a mere following of classical models like France and Italy, the Spaniards showed independence almost equal to, and an immediate command of form far greater than, that of the English theatre itself. In part they continued the religious tradition by their *autos*, or sacred plays; in part they diverged into romantic drama of the freest kind; and they almost invented for themselves the comedy of fashionable life and intrigue which was imitated freely by all the great playwrights of the 17th century in other countries. They furnished in the 'Don Juan' (q.v.) story one of the most fertile dramatic motives of Europe, and in Lope de Vega and Calderon they produced dramatists not equaled in fertility anywhere, and surpassed in genius only by the greatest names of the world.

Half at least of the most famous plays of the French classical period are more or less directly borrowed from Spain, and England also pillaged in her turn. But the period of Spanish dramatic productiveness was unfortunately as short as it was brilliant; and it has had no revival. What the Spaniards did for Europe in dramatic matters was to develop a fertile and powerful drama in complete defiance of classical traditions, to show the dramatic possibilities of the supernatural, and to push almost to the farthest extent the comedy of ingenious surprises, and "wheels within wheels." Cervantes' tragedy of 'La Numancia' has fine qualities, and Moreto, a disciple of Calderon, in his day divided the favor of the public with the greater dramatists.

French Drama.—As has been noted, the passion for scenic representation as illustrated by the mediæval drama, developed in France earlier than in any other European country and the change to the dramatic form of the Renaissance was nowhere more marked. The first influence which led to the creation of the new drama came, as has been said, from, or rather through Italy. It is at first sight surprising that so vigorous and racy a kind as the indigenous comic drama of France had already shown itself to be, should be supplanted by a merely learned and literary importation. Nor in fact was it so, except in Paris and one or two other centres of culture, while even there it was not completely banished until the genius of Molière, which long exercised itself in something very like the ancient farce, effected a combination between the vernacular, the Terentian, and the Spanish comedy. In tragedy, however, the school commonly called the Pleiade—that is, the poet Ronsard and his set—effected a complete revolution, following the Senecan model. The two plays of Jodelle, 'Cléopâtre' and 'Didon,' set the example of a tragedy exactly resembling those attributed to Seneca. This style of tragedy was continued for many years, and was cultivated by Robert Garnier and Antoine de Montchrestien among others. In the hands of a later school, of whom Alexandre Hardy was the chief, a great infusion of Spanish romanticism took place. Yet the scheme of the tragedy was not much altered, whatever might be the case with the treatment, when Rotrou and Corneille at last formed the French classical tragedy proper. Whatever may have been the repressive influences exerted upon Corneille by the Academy the original strength of his great genius has made his name stand as that of a liberator of French thought and literary expression. It is of interest to note the presence in his 'Cid' of the Spanish influence. In his early work, Racine followed Rotrou, Corneille and Quinault, but in 'Andromaque,' he struck a new note which was brilliantly sustained. Comedy underwent a change less marked than that in tragedy. In this Scarron's share must not be overlooked. The great debt of the French drama was owing, however, to the three great masters, Corneille, Racine, and Molière (qq.v.). As produced by these men, and by imitators in the second half of the 17th century, both tragedy and comedy assumed shapes which France long retained unaltered, and which for a time gave law and pattern to all Europe except England, and even to some extent there. The tragedy was of the Senecan kind, with a slight relaxation of some of the minor stringencies,

DRAMA

but with the unities for the most part maintained, and with, as a rule, the fortunes of a love affair substituted for the classic themes of fate and inherited doom. Comedy was less restricted. It might be written either in prose or in verse; the unities of place, and even to some extent of action, were neglected or construed loosely. A great variety of interest and subject matter was admitted, and the elaboration of really witty dialogue supplied endless opportunities of ornament. At the same time, in the hands of Molière nearly always, though less often in those of his followers, the moral or satirical purpose was carefully observed. The reign of these two kinds continued with little interruption till the end of the first quarter of the 19th century. In tragedy, Crébillon the elder succeeded in raising the style to something not far below Corneille's level, while Voltaire, applying his own singularly various and versatile talent to it, and enlarging the range of subject and situation, produced work which ranks as drama, though not as poetry, almost with the work of Corneille and Racine itself. In comedy, the level continued higher, very excellent work of the Molièresque kind, slightly altered in various ways, being done by Destouches, Marivaux, Piron, and others; while toward the middle of the 18th century, a sort of third or bastard kind, variously called as it approached one extremity or the other, *comédie larmoyante*, or *tragédie bourgeoise*, was introduced by La Chaussée, Sedaine, Diderot, and their contemporaries. Under the generic name of *drame* this may be said to have important representatives at the present day. It tended naturally to emancipate itself from the restrictions of tragedy, and so no doubt helped the great revolt of what is called the "romantic movement," which about 1830 practically destroyed the old French tragedy, and seriously interfered with the Molièresque tradition of comedy. The leader of the new school, Victor Hugo (q.v.), challenged the classicists by his "Hernani," which had the effect of literary dynamite. The alteration introduced a great amount of dramatic literature of much higher value than had been produced since the latter half of the 17th century. France once more became the central seat of drama in Europe, and foreign nations have freely adapted her productions. At the same time it must be confessed that tragedy proper has continually dwindled, and that even comedy of the higher kind has been somewhat injuriously affected. Among modern French dramatists may be noted Dumas, père (another leader of the romantic movement), De Musset, Augier, Scribe, Legouvè, Sardou, Dumas, fils; Coppée, Richépin and Rostand. The Belgian drama scarcely requires as yet to be treated independently of the French to which it has been considered an adjunct. Its most striking examples, the work of Maeterlinck, belong to the Parisian stage, representing there the new symbolism.

German Drama.—Of the great literary European nations, Germany has on the whole contributed least to the European drama, though one dramatic motive, the Faust story, is due to her, and though at two distinct periods, the middle of the 16th and the junction of the 18th and 19th centuries, the supernatural drama, of which this Faust legend has given the chief example, exercised, mainly through German impulse, great influence abroad. Otherwise the

Germans have been, save for one brief period, more remarkable for assiduous cultivation of the art of acting, and the theory of the stage, than for the production of great dramatic work. It was not till the middle of the 18th century that Lessing, not so much by his actual dramas as by his critical discussions of the drama and dramaturgy generally, earned for himself a really great place in dramatic history. At the end of that century what has been called the "Storm and Stress" school flooded Europe for a time with extravagant or sentimental productions of the class of which Schiller's "Robbers" and Kotzebue's "Menschenhass und Reue" ("The Stranger") are the most famous examples in two different kinds: while the first mentioned is perhaps the best, and the second one of the worst in literary merit. Kotzebue, indeed, was a very popular dramatist everywhere for a time. Schiller calming down from the state of mind out of which grew his "Robbers," produced a series of plays which to the Anglo-Saxon taste suffer from a too close approximation to the French style, while, according to classical standards, they err by dramatic license, but which nevertheless contain much noble poetry and some striking drama. In this same style Goethe's "Egmont" far surpasses anything of Schiller's, except the splendid chronicle-play of "Wallenstein," while his "Iphigenie in Tauris" is (if we disregard Milton's "Samson") the only modern classical drama which is really classical, and his "Faust" is not only one of the great works of European literature, but includes rather than constitutes some of the finest dramatic work to be found out of Shakespeare. Among the 19th century dramatists were Iffland, Körner, and the romanticist Tieck; and the 19th century has given among other minor dramatic works the plays of Hauptmann known as "dream-poems."

Dutch Drama.—Among the Dutch the drama began with the classical tragedies of Koster, known as the "Father of the Amsterdam theatre," and its highest point was reached by van den Vondel, the "Dutch Shakespeare." The national drama afterward reflected the change in French dramatic literature.

Scandinavian Drama.—In Denmark dramatic history begins with vernacular plays of the school-drama class extending through the 16th and 17th centuries. In Sweden, where such works held a nearly corresponding place, the plays of Messenius mark the beginning of national drama in the early part of the 17th century. The opening of the first Danish theatre in Copenhagen (1722) for which Holberg's comedies were written, marks the breaking away from French influence (till then dominant on the stage) which Wessel's "Love Without Stockings" aided in abolishing half a century later. Heiberg followed; then Ohlenschläger, a disciple of the German romantic school. In Sweden the revolt to romanticism came early in the 19th century. To late Scandinavian drama, Norway has contributed the works of Ibsen and Bjornson, dealing with social problems; the former's challenge to conservatism having won world-wide attention.

English Drama.—In England the drama was, except the German, the last to crystallize itself into a determined form, and while that form has on the whole maintained itself, various foreign influences have successively exercised

DRAMA

more or less force there. In England, as elsewhere, the miracle-play existed, and divers collections of it, known as the York, Digby, Townley, Chester, and other collections, have been preserved and published. But these are both later and ruder than the French examples. Nor does the drama seem to have taken in mediæval England, until quite the beginning of the 16th century, anything like the various extensions which it received in France. From this period we have a sufficient variety—interludes, moralities, mysteries, the most important composer being John Heywood. The great and original school, commonly known as that of the Elizabethan dramatists, did not, however, arise till the last quarter of the century. Among the somewhat formless dramatic products which preceded it, without as far as can be seen giving this great group of playwrights much help of pattern or precept, it is usual and proper to distinguish three pieces—‘Ralph Roister Doister,’ by Nicholas Udall; ‘Gammer Gurton’s Needle,’ assigned to Bishop Still; and the tragedy of ‘Gorboduc,’ or ‘Ferrex and Porrex,’ by Sackville the poet and Thomas Norton. The first and second are comedies, or rather farces, the second of ruder type than the first, but both exhibiting a considerable advance from the mere interlude toward comedy proper. The third is after the style of Seneca—a style which, attempted also by Edwards, by Daniel, and by the Countess of Pembroke, was obstinately resisted by the English genius, and took no root. It is not possible to assign any foreign origin to that school of English drama, which, suddenly appearing in the work of the so-called “university” group, of Marlowe, Greene, Peele, and in a rather different vein, Lyly, passed into the far more capable hands of Shakespeare, Ben Jonson, Chapman, Dekker, Beaumont and Fletcher, Webster, Middleton, Thomas Heywood, Massinger, Ford, and Shirley. These were the master-dramatists of the world, and the so-called Elizabethan school closed with the death of Shirley (1666). At this time the two great ethical defects of the whole school, the unnecessary horror of its tragedy, and the unnecessary foulness of its comedy, had reached their highest point. When after the Restoration tragedy revived it assumed a different style. Partly influenced by the admiration of things French, but more by the fact that D’Avenant had been enabled by Oliver Cromwell’s love of music to introduce even during the Commonwealth a sort of musical drama, there came in what are called “heroic” plays, the chief formal characteristic of which is that they are written in rhymed couplets. These held the stage for about 20 years, their chief writer being Dryden, with Crowne, Otway, Lee, and others following him in tragedy, and Shadwell, Crowne, Otway, Etheredge, Wycherley, and others in comedy. At last Dryden himself returned to blank verse, and produced in it the last really fine examples of English tragedy, properly so called, for the work of Rowe and Congreve in this kind is not noteworthy. The licentiousness of the Restoration drama was a marked feature, and has hardly been equaled in any other European country. The 18th century produced nothing of value, and all the attempts that have been made since at pure tragedy on the English stage have been merely literary work, or a kind of *drame*, or performances of

scarcely any literary merit but of some stage adaptability.

No such fate for a long time befell comedy. Etheredge and Wycherley, the two chief writers of the new school, may be said to have adjusted the old humor comedy of Jonson, and the bustling lively comic work of Fletcher, to the change of manners, the greater demand for literary style, and the example of Molière. Following them, in the reign of William of Orange and that of Anne, Congreve, Vanbrugh, and Farquhar carried this altered style to almost its highest possible perfection. All their work was, however, marred by a singular brutality of thought, even in the rare cases where this was not coupled with an equal coarseness of language. For a long time the public demanded, enjoyed, or tolerated this; but at length taste changed, and the famous paper war, which had begun with Jeremy Collier’s attack on the stage, undoubtedly did much to purify English comedy. It did not strengthen it, and nothing in the way of comic dialogue has since been produced which equals the best scenes of Vanbrugh and Congreve. Much comic work of merit was produced, until the time of Goldsmith. His two masterpieces were followed at no very great interval by the famous work of Sheridan, in which the methods of what may still be called Restoration comedy are adapted to altered tastes in literature and morals with surpassing skill. Sheridan is the last great name in the English drama. With rare intervals the works of Shakespeare have kept the stage; but all the other old tragic dramatists have become obsolete, and, excepting Goldsmith and Sheridan, the old comic writers have shared the same fate. Successive schools of dramatic writing have had their day of favor, sometimes owing to the predilections of certain popular actors. The most important, probably, of strictly 19th century English playwrights was Lord Lytton. Yet the ‘Lady of Lyons,’ ‘Money,’ ‘Richelieu,’ etc., though usually effective on the stage, can scarcely be said to be so to the reader, while on the other hand, the dramatic works of Byron, Coleridge and Taylor, of Tennyson, Browning, Landor, Horne, and Swinburne, belong to closet drama.

Among the minor dramatists whose work, even if in some cases very ephemeral, is at least prominent for successful acting qualities—may be named Jerrold, Brooks, Tom Taylor, J. W. Marston, Wills, Robertson, H. J. Byron, Boucicault, Grundy, H. A. Jones, A. W. Pinero, Chambers and Stephen Phillips.

Of the drama of other European countries it may be remarked that they have not shown even in the period of freeing themselves from the domination of the classic French school and responding to the romantic movement, such originality or brilliance as compels the world to lend an ear. To Russia, where Pushkin, Griboyedoff, and Ostrovski, have done work of importance, or at least of interest, we may look for a future drama that stands on a level with her school of fiction.

American Drama.—The history of the drama in the United States has more to do with players than with plays, for the work of American dramatists has been of small value, lacking in originality, in large themes and in literary construction. We have no dramatist worthy of the name; rather we have a school of brilliant

DRAMATIC ARTS — DRANESVILLE

translators, imitators and adapters. Early stage productions were of English plays and not until 1787 was an American play by an American author produced. This was 'The Contrast,' written by Royall Tyler, afterward chief justice of Vermont, and can be very briefly described as a patriotic trifle. The first prolific American dramatist, William Dunlap, flourished from 1798 to 1815, with half a hundred plays to his credit. Not until 1820, when Edmund Kean visited this country did the people look with favor upon the drama. When Edwin Forrest made his appearance in New York in 1826, he produced two tragedies by native writers, 'Metamora,' by John A. Stone, and 'The Gladiator,' by R. N. Bird. Dion Boucicault, who wrote 'Rip Van Winkle,' and other English actors, who were also playwrights, made American tours and remained here to stimulate the drama, but until the close of the Civil War, the American stage was dependent upon England for her plays, her players, and her playwrights. Augustin Daly was among the first to encourage the American playwright. He maintained a company of superior players and was in hearty sympathy with a purely American drama.

The nearest approach to a purely American drama had its inception in the work of Bartley Campbell (b. 1843; d. 1888). He produced 'My Partner,' a western melodrama, in New York, in 1879, with remarkable success. This was followed by 'Fairfax' and 'The Galley Slave,' and later by 'Matrimony,' 'The White Slave,' 'Siberia,' and 'Paquita.' Several of his plays were produced in England with the same success that had been accorded them in this country. Bronson Howard, a contemporary of Campbell, was the author of a dramatic composition called 'Fantine,' which was played in Detroit as early as 1864. His first important play, 'Saratoga,' was produced by Augustin Daly in 1870. Other plays by Mr. Howard gave him a foremost position among American playwrights. His best-known plays were 'The Banker's Daughter' (1878); 'Old Love Letters' (1878); 'Young Mrs. Winthrop' (1872); 'One of Our Girls' (1885); 'The Henrietta' (1887); 'Shenandoah' (1889); 'Aristocracy' (1892). Several of these plays were produced in London, and 'Saratoga' was played in Berlin by Paul Lindau. A third American among the earlier successful playwrights was Henry C. DeMille (1850-93). Augustine Daly was also a successful playwright. His first play, 'Delmar's Daughter,' was produced in 1883. Then followed 'The Main Line,' 'Lord Chumley,' 'The Charity Ball,' and 'Men and Women.' 'The Wife' was written in collaboration with David Belasco, and was played at the Lyceum theatre (1887). Other American playwrights who have won distinction include David Paul Brown, Augustus Thomas, who wrote 'Arizona' and 'Alabama'; William Gillette, author of 'The Private Secretary,' George H. Baker, Epes Sargent, Henry Guy Carleton, Charles H. Hoyt, Madeleine Lucette Ryley, David Belasco and Clyde Fitch.

A phase of the drama in America is the adaptation of the historical novel, which had its genesis in the stage production of 'Uncle Tom's Cabin.' The so-called rural plays, like Denman Thompson's 'Old Homestead,' are thoroughly national in plot and character and have met with phenomenal financial success,

despite the fact that as literary productions they are invariably defective. At the present writing the drama in this country is at the lowest possible ebb; a popular craze for burlesque, light comedy and vaudeville having occupied the almost undivided attention of manager, actor, and playwright.

Summary.—A survey of the great body of dramatic literature will lead to the conclusion that not merely the forms which literary work for dramatic representation can take, but even the situations and incidents which are suitable to such representation, are by no means very numerous, and tend to reproduce themselves in the practice of different times and different nations with considerable regularity. We also see that considerably less variety is obtainable in tragedy than in comedy, and that the former is infinitely the more difficult. The ages and circumstances in which drama has flourished most, have been those in which it occupied for a time and sometimes almost monopolized the position of public instructor and informer on questions of thought and news, as well as that of public entertainer. Another point worth noting is that the periods of best acting have by no means always coincided with the periods of best drama writing. Shakespeare's plays, in continuing to hold their own upon the stage, have trained great actors without producing great dramatists. See ACT; CHORUS; COMEDY; FARCE; THEATRES, AMERICAN; MIRACLE PLAYS AND MYSTERIES; PLAYWRIGHT; SHAKESPEARE; STAGE, THE.

Bibliography.—Archer, 'English Dramatists of Today'; Collier, 'History of English Dramatic Poetry'; Crawford, 'English Comic Dramatists'; Freytag, 'The Technique of the Drama'; Hazlitt, 'English Comic Writers'; Klein, 'Geschichte des Dramas' (Leipsic, 1865-86); Lamb, 'Essays' (Dramatic); Lowell, 'The Old English Dramatists'; Matthews, 'The Development of the French Drama'; Moulton, 'The Ancient Classical Drama'; Patin, 'Etudes sur les tragiques grecs' (Paris, 1885-94); Prölss, 'Geschichte des neueren Dramas' (Leipsic, 1880-3); Price, 'The Technique of the Drama'; Scott, 'The Drama of Yesterday and To-day' (1889); Schaeffer, 'Geschichte des Spanischen Nationaldramas'; Schlegel, 'Vorlesungen über dramatische Kunst und Litteratur'; Symonds, 'Shakespeare's Predecessors in the English Drama'; Tieck, 'Dramaturgische Blätter'; Ward, 'English Dramatic Literature.'

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

Dramatic Arts, American Academy of, a school of dramatic arts, chartered by the regents of the state of New York, in 1889. Its object is to train pupils for the stage. It offers a two years' course, including opportunities for public appearances. The school was established by Franklin Sargent (q.v.).

Drammen, drām'mēn, Norway, a seaport at the mouth of the Drammen River, on an arm of the Christiania Fjord, 25 miles southwest of Christiania. It is the second port in the kingdom for the export of timber. Pop. 20,441.

Dranesville, Battle of. Dranesville is on the Alexandria and Leesburg turnpike, 16 miles northeast of Washington; and 20 Dec. 1861, to collect a supply of forage near there, Gen. E. O. C. Ord, with his brigade of Pennsylvania

Reserves, the First Pennsylvania Rifles, a battery of four guns, and a detachment of cavalry—in all about 3,900 men,—moved from camp near Langley's. Driving a few Confederate cavalry from Dranesville, he entered it. It happened that the same morning Gen. J. E. B. Stuart started from the Confederate lines at Centreville with a brigade of infantry, 150 cavalry, four guns, and about 300 wagons, to gather hay near Dranesville; and he was so engaged when he heard that Ord was approaching. Fearing for the safety of his train, and believing that the only way to save it was to attack Ord, he advanced for that purpose, at the same time ordering his wagons back to Centreville. Stuart attacked with great impetuosity, and after a severe fight of two hours was defeated and retreated to Centreville, with a loss of 186 killed and wounded. Ord's loss was 67 killed and wounded. Compared with subsequent events, Dranesville was a small affair, but it gave encouragement to the Union cause and stands greatly to the credit of the Pennsylvania Reserves. Consult: 'Official Records,' Vol. V.

E. A. CARMAN.

Draper, Andrew Sloan, American educator: b. Westford, N. Y., 21 June 1848. He served in the New York legislature; was appointed by President Arthur one of the judges of the court of Alabama claims; was State superintendent of public instruction in New York in 1866-92, superintendent of schools in Cleveland, Ohio, in 1892-4; and in 1894 became president of the University of Illinois. In 1904 became state superintendent of schools, New York. He has published: 'American Schools and American Citizenship'; 'American Universities and the National Life'; 'The Rescue of Cuba,' etc.

Draper, Daniel, American meteorologist: b. New York 2 April 1841. He studied science under his father, J. W. Draper (q.v.), acting as his assistant and amanuensis for years. After 1869 he was director of the New York Meteorological Observatory, the self-recording instruments in use there being of his design.

Draper, Henry, American scientist: b. Prince Edward County, Va., 7 March 1837; d. New York 20 Nov. 1882. He is a son of J. W. Draper (q.v.). He was well known for his work in the line of celestial photography, and published 'A Text-book on Chemistry' (1866).

Draper, John Christopher, American physician: b. Prince Edward County, Va., 31 March 1835; d. New York 20 Dec. 1885. He was graduated from the medical department of New York University; was professor of physiology in that institution 1858-60, and professor of chemistry in the medical department 1866-85. He was also professor of chemistry at Cooper Union, and professor of physiology and natural history at the College of the City of New York. He wrote: 'On Respiration' (1856); 'Text-book on Anatomy, Physiology and Hygiene' (1866); 'Practical Laboratory Course in Medical Chemistry' (1882); 'Text-Book of Medical Physics' (1885).

Draper, John William, American physiologist and chemist: b. Saint Helens, Lancashire, England, 5 May 1811; d. Hastings-on-the-Hudson, N. Y., 4 Jan. 1882. He came to the United States in 1833, and took his degree as M.D. at the University of Pennsylvania in 1836. He be-

came professor of chemistry in the University of New York in 1841, and in 1850 professor of physiology. Among his works are: 'Human Physiology' (1856); 'History of the Intellectual Development of Europe' (1862), a work of great importance and very widely read; 'History of the American Civil War' (1867-70); 'History of the Conflict between Religion and Science' (1875), which ran through many editions and was translated into nearly all the languages of Europe.

Draper, Lyman Copeland, American antiquarian: b. Hamburg, N. Y., 4 Sept. 1815; d. Madison, Wis., 26 Aug. 1891. He removed to Wisconsin in 1853; became corresponding secretary of the State Historical Society, and it was mainly through his efforts that the State secured its library and its important antiquarian collection. He published: 'Collections' of the State Historical Society (10 vols. 1853-87); 'Madison the Capital of Wisconsin and its Heroes' (1857); 'King's Mountain and its Heroes' (1881).

Draper, William Franklin, American manufacturer: b. Lowell, Mass., 9 April 1842. He was educated in the public schools and at a private academy, served in the Federal army through the Civil War, becoming brigadier-general by brevet. He became a successful manufacturer of cotton machinery and made and patented many improvements in it. He was a presidential elector in 1888; a Republican member of Congress 1892-7; and United States ambassador to Italy 1897-9. While in Congress he was a member of the Committee on Patents and the Committee on Foreign Affairs.

Drapery. See COSTUME.

Drapier Letters, a series of letters published by Dean Swift (q.v.), over the signature M. B. DRAPIER in 1724. They were called out by the proposal to impose upon Ireland a debased coinage, from which a court favorite and a king's ministers were to get the profit. The opposition to the action excited by these letters defeated the project and gave Swift a reputation he never lost. See also SWIFT, JONATHAN.

Draughts. See CHECKERS.

Drave, drä'vê, or **Drau**, a European river which rises in Tyrol, flows east-southeast, part of its course between Hungary on the left and Croatia and Slavonia on the right, and after a course of nearly 400 miles joins the Danube 14 miles east of Essek. It is navigable for about 200 miles.

Dravid'ian, a term applied to the people who inhabited the southern part of what is now India previous to the advent of the Aryans, and also to the language spoken by these same people. The Dravidian languages are generally considered to belong to the Turanian class—a family of languages said by some authorities to include all the Asiatic languages in general, outside the European and Semitic families. The Dravidian languages include the Tamil, Telugu, Canarese, Malayalam, Tulu, Tuda, Gond, Rajmahal, and Oraon. There are other minor subdivisions made by some authorities. Only the first four mentioned have a literature. The Dravidians now occupy the greater part of the peninsula of India. The Tudas, or Todas, in the region of the Nilgiri Hills, belong to the lowest of civilized people or races, while among

the Tamils are found many who have attained a high place in literature.

The Dravidians proper are quite distinct from the Aryans, but they have been assimilating with those around them, so that now among them may be found traces of the Caucasians, and their literature partakes much of the Aryan culture; but they have kept their speech comparatively pure for centuries. In the southeastern part of the peninsula and in Ceylon live those who speak the Tamil; estimated to be about 16,500,000 people. North of the Tamils, and on the east, are the Telugus, about the same in number. The Canarese is spoken by about 10,000,000 people who live in the western part of the peninsula; and the Malayalam by about 4,230,000 people who live in the southwestern part of the peninsula.

In the Tamil and Telugu languages there are a number of excellent literary productions; not all original, some are modeled on or adapted from the Sanskrit. Two of the poems which may be traced to at least the 10th century—but which the Tamils claim are much older—are the 'Kintamani' and the 'Naladiyar.' The latter has been translated by Pope. The Tamils claim also that Agastya lived before Christ, and that he was the first teacher of science and literature. In about the 12th century, the poet Kambar made, in Tamil, an adaptation of the Sanskrit poem 'Ramayana,' one of the two great epics of India; and in the 16th century the poet Ati-Vira-Rama Pandya, a native king, wrote works of merit. The Tamil poet Tayumanavar wrote in the beginning of the 18th century; and at about the same time, an Italian missionary, a Jesuit named Beschi, wrote in the Tamil, both prose and poetry. The work of this literary priest has done much toward directing the attention of eastern scholars to the Tamil language and literature.

The oldest poem extant in Telugu language is a version of the Sanskrit poem, the 'Mahabharata,' the other of the two great epic poems of India. This poem was written in the Telugu by Nannaya Bhatta, in the 12th century. A poet named Cesava of the 12th century wrote in the Canarese. In the Malayalam there is one poem based upon the Sanskrit, an account of Rama, a heroic prince who belonged to a royal house of India. There are also versions of both the 'Mahabharata' and the 'Ramayana.' Consult: Dalton, 'Descriptive Ethnology of Bengal'; Kingcote, 'Folk-Lore of Southern India'; Caldwell, 'Comparative Grammar of Dravidian'; Oppert, 'Original Inhabitants of India'; Hunter, 'Dictionary of the Non-Aryan Languages'; Pope, 'First Lessons in Tamil'; Graul, 'Tiruvalluvar's Kural'; Hultzsch, 'South Indian Inscriptions, Tamil and Sanskrit'; Arden, 'Grammar of the Telugu Language'; Brown, 'Dictionary of Telugu'; Hopkins, 'Great Epic of India'; Fraser, 'Literary History of India'; Carr, 'Collection of Telugu Proverbs.'

Draw-loom. See DAMASK WEAVING.

Drawback, in common law, means an allowance or rebate made by the United States government to merchants on the re-exportation of certain imported goods, liable to duty. This drawback in some cases consists in the surrender of the whole duties collected on the goods; in other cases, only a part of the duties paid on the importation is returned to the importer.

Drawbridge, a bridge with a lifting or sliding floor, such as may be used for crossing the ditches of fortresses or may be constructed to cross navigable waters where the height of the roadway is insufficient to allow vessels to pass underneath. There are various kinds of drawbridges. One is the lifting bridge, which is raised bodily on one end. For fortifications this is the kind commonly employed, the platform forming or strengthening the gate when raised. For detailed history see *Movable Bridges* under BRIDGE.

Drawing is the art of representing upon a flat surface the forms of objects, and their positions and relations to each other. The idea of nearness or distance is given by the aid of perspective and foreshortening. Two ancient Greeks, Ardices and Telephanes, are said to have been the first who attempted to give the idea of roundness by a combination of lines called hatching. Philocles and Cleantes were the inventors of monochromes, or drawings in one color, in which the lighter parts were produced by mixing the color with white. This formed the transition from drawing to painting. The Greeks were very strict and precise in their teaching of drawing. Pamphilus, the teacher of Apelles, desired that his pupils should remain 10 years with him receiving instruction. Linear drawing was brought in Greece to the highest degree of perfection. The contest between Apelles and Protogenes as to which of them could draw lines with the greatest delicacy and precision is well known.

The term drawing, in its strict sense, is only applicable to the representing of the forms of objects in outline, with the shading necessary to develop roundness or modeling. Pictures in oil or water colors, though based on drawing, should be exclusively called paintings. This distinction is observed in what follows.

The various styles of drawing may be divided into three kinds: (1) pen drawings; (2) chalk drawings, which may include lead-pencil drawing; (3) drawings shaded with the brush or hair-pencil. Pen drawings are often confined to pure outlines; an appearance of relief or projection being given by thickening the lines on the shadow side. Finished pen drawings have all the shading produced by a combination of lines termed hatching. Small, fine-pointed brushes are now often used instead of the pen, more delicacy and variety of tone being obtained. Drawings shaded with the brush are outlined with the pen, the shading being laid on or washed in with the brush in tints of Indian ink, sepia, or bistre. This method is used chiefly for architectural drawings and historical sketches. Chalk drawings are most suited for beginners, as the errors can be easily corrected. Black, red, and white chalks are used. When the chalk is powdered and rubbed in with a stump, large masses and broad effects can be produced with much rapidity.

Drawings may be divided into five classes: sketches, finished drawings, studies, academic drawings, and cartoons. First sketches are the ideas put upon paper by an artist, with the intention of carrying them out with more completeness and detail in some more elaborate work. They are merely intended to fix and retain his first thoughts. Finished drawings are such as are carefully executed and made complete in all

DRAWING

their parts. By studies are generally understood separate parts of objects carefully drawn either from life or from figures in relief; for example, heads, hands, feet, arms; but sometimes the term is applied to drawings of entire figures. To this class also belong drawings of the skeleton and muscles, as well as of draperies, animals, trees, foregrounds or other parts of landscapes. Academic drawings are those made in art academies from a living model in lamplight, which brings out the shadows more than daylight. The position of the person who serves as a model is carefully arranged at the commencement of each sitting, and in that position he is required to maintain himself. In this way the learners practise themselves in the drawing of the figure in various attitudes. In studying drapery and dress, a lay figure, made of wood and with movable joints, is clothed in various styles, and drawings made from it. Cartoons are drawings made on stout paper of the size of the paintings to be executed from them. They are mostly employed for pictures of large size, and are regularly used by fresco painters. The design is pricked through or traced from the cartoon upon the surface that is to receive the finished picture. See CAR-TOON.

The first sketches of the great masters are especially prized, because in them we find expressed most clearly the first glow of their conceptions. It is therefore much more difficult to make a copy of a first sketch with such accuracy as to deceive, than it is to make such a copy of a finished picture, for in the former case so much depends upon the freedom and facility with which the idea is expressed. The great schools of painting differ from one another as much in their drawing as in their painting. In Italy the Roman school, through Raphael's fine sense for the beautiful and expressive in form, and through his study of the antique, became the true teacher of beautiful drawing. The Florentine school tried to surpass the Roman precisely in this particular, but it lost by exaggeration what it had gained by learning and a close study of anatomy. In the Lombard school a tender style of drawing is seen through harmonious coloring, but this is rather derived from nature and instinctive feeling than attained by a close obedience to scientific principles. In the Venetian school the drawing is often veiled in the richness of the coloring, and if in some of the Venetian masters the drawing is bold and powerful, it indicates no deeper sense, no elevation or dignity, and is only imposing by its fearlessness and luxuriant fulness. The Dutch school excels in a careful and minute style of naturalistic drawing, combined with great excellence in coloring. The French school in the time of Poussin was very correct in its drawing; at a later period its style betrayed a great amount of mannerism. David introduced again a purer taste in drawing and a close study of the antique, and these are qualities which distinguish his school (the so-called classical school) from the romantic school of a later period, and the eclectic school of the present day, whose drawing is characterized by less dignity and grace, but shows more individuality and character. The modern German masters have a different style, which has been formed by an independent study of nature, and of the great masters, modified by the idiosyncrasies of the German mind. The drawing of the British school is naturalistic rather

than academic. It has of late years much improved in accuracy and expressiveness. The American school is similar to that of France, the artist being given to mannerisms, as evidenced in the work of Gibson, Taylor, Meyer, and others.

The best mode of acquiring the art of drawing is to commence by the simplest geometrical lines, proceeding to geometrical figures, from the more simple to the more complex. The student should first practise drawing accurately—perpendicular, horizontal, oblique, curved, and waved lines; then he should draw squares, triangles, circles, and ovals. These forms are the best for early instruction, because from their simplicity any inaccuracy in their delineation is easily detected. When the learner has conquered the difficulty of drawing these forms with accuracy he should proceed to draw those of a more arbitrary kind, such as the scroll and cylinder; then pyramids, obelisks, or vases, cups, books, baskets, etc., by which he will gradually become possessed of a more correct vision, and be able to give a proper degree of grace to his curved lines.

Having acquired a sufficient facility in drawing and shading these simple forms, he ought next to proceed to drawing from copies outlines of antique busts and statues. Such subjects are well calculated to give correctness to the eye, as from their beauty and perfection any slight deviation from their just proportions instantly offends and is easily detected. On the other hand, when landscapes and flowers are used as copies, an error in drawing the irregular forms that occur in them is much less easily perceived, the student is apt to be too easily satisfied with his work, and to fall into negligent habits which cannot afterward be easily eradicated. All these drawings should be made on a large scale, and be executed in a bold, distinct, and what painters call a broad style. Thus all the separate features of the face should be drawn the full size of life; for next to drawing from bad examples, nothing is a greater hindrance to proficiency than the making of small and miniature drawings.

In beginning a drawing, first get the object or objects into proper position on the paper, next into proper size, and last into proper shape. By inverting this mode of procedure learners frequently render their work very irksome, and are mortified to find that when they have matured a portion of their drawing, the part is not truly in position, or not of the proper size. The learner's first care should be accuracy of outline; next a studious observation of the shading and shadows that give roundness and relief to objects, combined with an earnest aiming at perfect manipulation. These being mastered, boldness of touch and rapidity of execution will follow.

Chalk-drawings are generally executed on a colored paper, for the purpose of producing a middle tint, so that a drawing on gray or stone-colored paper will have three degrees or tones of color—two from the chalks and one from the paper. Charcoal is used to sketch in the outline, which is then matured and made correct with Italian or hard black chalk. The shadows are laid in freely and broadly with soft black French chalk, and then softened and blended together with a stump. Chalk has many advantages over black-lead pencil; more especially

DRAWING AND QUARTERING — DREAMS

it is suited for drawings of large size, and it is by practising on a large scale that freedom and accuracy of hand are mainly to be acquired.

Before attempting to make sketches of landscapes from nature, the student ought to be pretty well acquainted with the general rules of perspective. He may then sketch whatever pleases him, commencing with the foreground and nearest objects, and from them comparing the size and relative positions of the more distant; for instance, if a wall or building come into the foreground of the sketch, from it he may find the position of a more distant object, such as a church, by comparing horizontally what part of the wall the church is opposite, and so on, for the retiring distance.

Literature.—Cross, 'Color Study'; Hamerton, 'Drawing and Engraving'; Hutchinson, 'Some Hints on Learning to Draw' (1893); Leland, 'Drawing and Designing'; Maginnis, 'Pen Drawing' (1900); Ruskin, 'Elements of Drawing'; Spiers, 'Architectural Drawing'; Veollet, 'Learning to Draw'; Walker, 'Hand-book of Drawing'; White, 'Drawing for Reproduction'; Wilson, 'Free-hand Perspective.'

Drawing and Quartering, the punishment of treason in Great Britain in force till 1870. The law provided that the offender be drawn to the place of execution on a hurdle; that he be hanged by the neck and disemboweled; that his head be severed from his body, and that body be divided into four parts, or quartered.

Drawing-board, a board on which paper is strained for water-color painting. It is made of a flat piece of wood held together and prevented from warping by an edging of other pieces, the grain of which runs in an opposite direction. The drawing-paper is first damped and then attached to the edges of the board with thin glue, gum, or paste, and when dry becomes perfectly tight and flat.

Drayton, Michael, English poet: b. Harts-hill, Warwickshire, 1563; d. London 1631. His first appearance as an author was in 1591, by the publication of 'Harmony of the Church, Containing the Spiritual Songs and Holy Hymns of Godly Men, etc.,' followed in 1593 by 'Idea, the Shepherd's Garland,' and 'Roland's Sacrifice to the Nine Muses,' a series of eclogues. In the same year appeared his 'Legend of Piers Gaveston,' and in 1594 his 'Matilda.' Drayton's great poem is his 'Polyolbion' (1613), a sort of topographical description of England. It is generally extremely accurate in its details, with, at the same time, many passages of true poetic fire and beauty. It is frequently, however, tedious and obscure, and its extreme length is sufficient to deter many from undertaking its perusal. The gem of Drayton's poems is his 'Nymphidia, the Court of Fairy,' edited by Sir E. Brydges in 1814. His other works comprise several historical poems, such as the 'Barons' Wars' (1603, first issued in 1596 under the title 'Mortimeriados'); 'England's Heroical Epistles' (1597); the 'Legend of Great Cromwell' (1607); the 'Battle of Agincourt' (1627); besides numerous legends, sonnets, and other pieces. He was buried in Westminster Abbey, where there is a monument to his memory.

Drayton, Thomas Fenwick, American military officer: b. South Carolina about 1807; d. Florence, S. C., 18 Feb. 1891. He was graduated at the United States Military Academy

in 1828, and resigned from the army in 1836. He entered the Confederate army upon the outbreak of the Civil War, and played a prominent part during the attack on Fort Royal, commanding a force in Fort Walker which he was forced to evacuate.

Drayton, William, LL.D., American judge: b. South Carolina 1733; d. June 1790. He was educated for the bar in the Middle Temple, London, where he studied four years. He returned to America in 1754, and was appointed chief justice in the province of East Florida in 1768. During the War of the Revolution he was suspended from his office and reinstated in it, and went with his family for a time to England. After the Peace he became successively judge of the admiralty court of South Carolina, associate justice of the State, and a judge under the Federal government.

Drayton, William, American politician: b. South Carolina; d. Philadelphia 24 May 1846. He was a representative in Congress from South Carolina from 1825-33, and in 1830 was a leader of the Union party in opposition to that of nullification. He resided in Philadelphia many years prior to his death, and in 1839 succeeded Nicholas Biddle as president of the United States bank, the affairs of which he found it impossible to retrieve.

Drayton, William Henry, American statesman: b. Drayton Hall, S. C., September 1742; d. Philadelphia 3 Sept. 1779. He was educated in England at Westminster School, and at Balliol College, Oxford. Returning to America in 1764, he became an active writer on political affairs, and published letters on the side of the government, which brought him into controversy with Christopher Gadsden and other patriotic leaders. As the Revolutionary crisis approached he espoused the popular cause. In 1774 he was appointed judge of the province, and when the Continental Congress was about to sit he published a pamphlet under the signature of "A Freeman," which substantially marked out the line of conduct pursued by the Congress. In 1775 he was president of the Provincial Congress, and in 1776 was elected chief justice of South Carolina. He was a member of the Continental Congress from 1778 till his death. His 'History of the Revolution' appeared in 1821.

Dreams, subjective phenomena dependent on natural causes, or trains of ideas which present themselves to the mind during sleep. The principal feature of the state of dreaming is the absence of voluntary control over the current of thought, so that the principle of suggestion has unlimited sway. The utter want of coherency in the images that appear before the mental eye excites no surprise in the dreamer. All reflex acts are lowered; breathing and the action of the heart become slower, and the other organic functions are diminished. These phenomena are due to the exhaustion of the energy of the brain, and to the changes necessary for its restoration, and for the removal of tissue waste. They are accompanied by a diminution of the amount of blood flowing through the brain. As we go to sleep our senses drop off one by one; we cease to see or smell, while we still continue to hear. A light sleeper may, without waking, answer questions put to him, and we may sometimes go so far as to deliver an oration or pen a treatise, which, in our wak-

DREAMS

ing remembrance, may often seem much more clearly and vigorously thought out than if we had composed them by the efforts of the will during waking hours.

Cabanis, in his '*Rapports du Physique et du Moral de l'Homme*,' says of Condillac, that he often brought to a conclusion in his dreams reasonings on which he had been employed during the day, and which he had not completed when he went to bed; and of Franklin, that that wise and enlightened man believed that he had been often instructed in his dreams concerning the issue of events which at that time occupied his mind.

Coleridge thus describes the circumstances under which the fragment called *Kubla Khan* was composed: He had fallen asleep in his chair while reading in Purchas' '*Pilgrimage*' of a palace built by Khan Kubla, and remained in that state for about three hours; during which he could not have composed less than from 200 to 300 lines, if that can be called composition in which all the images rose up before him as things, with a parallel production of the correspondent expressions, without any sensation or consciousness of effort. On awaking he instantly sat down to commit the poem to paper. After he had written the lines subsequently published, he was interrupted for a time, and when he returned to the task the poem had vanished from his memory. The cause of this coherency no doubt is, that when we are awake the attention is more liable to be withdrawn from the train of ideas by external objects.

Generally, however, dreams are wanting in coherency; all probabilities and possibilities of time, place, and circumstance are violated. Nothing is more common than for the mind in dreams to combine objects and events which could have had no associated existence. The faces of friends long since dead, and events long since past rise before us sometimes with more intense vividness than in real existence and cause no surprise by their incongruity, because the mind views them without the association of ideas which, in a waking state, would place them at such a distance from the present time that no cognizance could be taken of them except as very remote events. It is the belief we for the time possess that these trains of ideas are sensations that removes all sense of surprise and incongruity; we have not, together with these apparent sensations, the ideas of the death or the period elapsed, and we are not surprised at seeing, or believing that we see, the persons or events, any more than we would be surprised at seeing, if that were possible, the same persons or events when we are awake, if we did not know that the person had died or that the event was historical. This explanation is confirmed by those instances in which we do feel surprise. The idea of a person or event believed to be seen may call up any of the additional ideas that have before been absent. We fancy we see a person, and then we think of his death; we are immediately surprised, and we have an inner dream that we are dreaming.

Sensations of physical pain, including those of heat and cold, and sensations in the alimentary canal, have an important influence on dreams. Dr. Gregory relates, that having occasion to apply a bottle of hot water to his feet on retiring to bed, he dreamed of making the ascent of Mount Etna and found the heat intolerable. Dr.

Reid having had a blister applied to his head dreamed of being scalped by Indians. One notable peculiarity is that when the physical sensation influences the dream, the intensity of it, pleasurable or painful, is considerably increased. Thus if the ear be disturbed by the sounds of a flute, a thousand beautiful and pleasing associations may be invoked; the air is filled with the sounds of harps, or the combined intricate harmonies of a concerted and accompanied piece, and we may call up images of the performers themselves.

The rapidity with which we dream is also remarkable. We may seem to live a weary lifetime in the dream of a minute; the sprinkling of a few drops of water on a gentleman's face produced a dream in which the events of a whole life passed before him, ending with a protracted struggle on the borders of a lake into which he was plunged. The whole process must have taken place in a second or two, as the dreamer was aroused from sleep by the application of the water. Some authorities declare that all our dreams take place when we are in process of going to sleep or become awake, and that during deep sleep the mind is totally inactive. This is denied by the majority of philosophers, and with apparent reason.

Some maintain that no sleep is ever so profound as to be perfectly dreamless. Sir William Hamilton thought that we dream always, but simply forget our dreams. This proposition, which obviously cannot be proved, is supported by the fact that we forget with the utmost readiness what we know we have dreamed, and that others may see in our actions evidence of dreaming of which we ourselves afterward retain no recollection. Many facts, however, in connection with injuries to the head point in an opposite direction. Maudsley quotes the case of a boy who was rendered insensible by the kick of a horse. After trephining the depressed bone he became sensible. The surgeon took advantage of the hole in the skull to make firm pressure on the exposed brain after asking him a question. While the pressure lasted he remained silent, but the instant it was removed he made a reply, never suspecting that he had not answered at once. With an over-congested brain, there is a tendency to a rapid succession of vivid dreaming, interrupted by intervals of wakefulness. The brain cells are too excited by the excess of blood to pass into a condition of repose, and their activity tends to keep up the congestion of the organ. When the blood is deficient in quantity or quality, or poisoned by substances which ought to be removed from the body, or when the nervous system is exhausted by such causes as over-fatigue, shock, or depressing emotions from over-indulgence in any form, then unpleasant dreams are apt to follow. The onset of acute disease (especially when affecting the nervous system) is not infrequently heralded by continued dreaming or continued sleeplessness. Depressing dreams should always be regarded as an indication of need for attention to health, or to relaxation from work, more especially, perhaps, by those engaged in professional pursuits.

The special character of many dreams is determined by the condition of the organs of the thorax and abdomen, and of the muscular system. For example, the presence of indigestible food in the stomach, by embarrassing the breathing and the action of the heart, suggests the

ideas of the various forms of nightmare, the monster, or the crushing weight, from which there is no escape, which are closely akin to the sensations induced by similar effects on the heart during the day. An uncomfortable position in bed, a strained condition of the muscular system, will cause dreams of falling over precipices or of struggling. Certain drugs give a specific character to dreams. The magnificent visions of the opium stupor have been made familiar by the classical account of De Quincey. It is well to mention that the splendor of the dreams is not so certain to follow the indulgence of the opium habit as is the degradation of our mental and moral and physical nature. The furious homicidal delirium caused by *hasheesh* (Indian hemp) is indicated by its being the origin of the term "assassination." Excessive indulgence in alcohol gives rise to delirious dreams characterized by unfounded dread and suspicion. Workers in india-rubber factories, who are exposed to the inhalation of bisulphide of carbon, suffer from fearful dreams of being murdered and falling over precipices. Many other drugs induce almost as certain results. Occasionally intellectual efforts are made during sleep which it would be difficult to surpass in the waking state.

It is an interesting question how the deaf and the blind dream. Dr. Darwin records the case of a gentleman who had been deaf for 30 years, and who never dreamt of persons conversing with him except by the fingers or in writing, and never had the impression of hearing them speak. Mr. Johns, in the 'National Review' (1885), states that the blind, who can of course have no visual images, dream as actively as those that see, and dream by hearing, touching, and smelling; they tell the size of a room by the sounds of imaginary persons walking in it, recognize a friend by his voice, or by touching him, or the freshness of the morning by the smell of the air. In some forms, which may be named somnambulist dreams, in which the dream is acted as well as thought out, it is remarkable that almost no recollection is retained. The night terrors of nervous children, so frequent during their second dentition, often cause unnecessary anxiety. Dr. Clouston of Edinburgh refers to a case where a confirmed somnambulist during his sleep seized his child, to whom he was devotedly attached, and caused his death by dashing him against the wall, under the belief that he saw a wild animal in the room. The man was acquitted of the charge of murder, it being held that he was not responsible during sleep. The condition might be described as one of sanity during the waking hours, and of the opposite during sleep. Such cases are generally indications of a strong hereditary tendency to instability of the nervous system.

Among the peoples of antiquity, dreams were regarded as direct messages from the spiritual world, of either divine or diabolical origin; their interpretation was elevated to the rank of a science. At the royal courts of Babylon and Egypt the interpretation of dreams was part of the duties of soothsayers. Now the tendency is to explain away on the ground of mere coincidence the undoubted facts of foretelling the future. Some regard the apparent foretelling of the future as on a par with the working out of a problem by a mathematician. It is the solution during sleep of the question that has been oc-

cupying the mind of the deep (moral or religious) thinker.

Pseudo-psychologists believed that dreams are caused by the flight of the soul to other regions, and that on its return to the body it remembered what it had actually seen. Some persons have thought dreams the proof of the soul's immortality. This hypothesis formed the basis of the religion of Comenius and of Emanuel Swedenborg. Swedenborg strengthened the Church which he founded by his claim to have visited Paradise and his report of his experiences there. The North American Indians regarded dreams as prophetic and often took them as solemn injunctions. Among more enlightened people there may be an inducement to action from the impression of a dream; here, also, the consequence is the fulfilment of the prophecy. Such were the dreams of Judas Maccabæus, of Sylla, of Germanicus, and the dream of the priestess of Proserpine on the eve of Timoleon's expedition from Corinth to Syracuse, that Ceres volunteered to be his traveling companion into Sicily. The dream of Olympia, that she was with child of a dragon, might both have suggested the mode of education and incited the warlike spirit of Alexander. It is said that the city of Carthage was rebuilt by Augustus Cæsar in consequence of the dream of his uncle Julius. Of such a nature, too, were the dreams of the Emperor Julian and of Calphurnia; and such was the dream of Cromwell that he should be the greatest man in England. In all these, and a thousand more, the mere constant thinking excited the dream. The ambitious thought of Cromwell was constantly haunting his waking moments, pointing to personal aggrandizement, and, of consequence, imparted a like character to his slumbers.

J. ACKERMAN COLES, M.D.

Drebbel, Cornelis van, Dutch philosopher and inventor; b. Alkmaar, North Holland, 1572; d. London 1634. He lived in London from the year 1620, devoted entirely to scientific labors. He invented several philosophical instruments, among which, it is said, were the compound microscope and a thermometer consisting of a glass tube containing water connected with a bulb containing air. His contemporaries say that he displayed to King James a glass globe in which by means of the four elements he had produced perpetual motion, and that by means of machinery he imitated rain, thunder, lightning, and cold, and was able quickly to exhaust a river or lake. He discovered a bright scarlet dye for woollens and silks, which was introduced into France by the founders of the Gobelin manufactures; and the invention of the telescope has been ascribed to him, but on no good grounds. Drebbel left treatises which appeared first in Dutch (1608), and afterward in Latin, under the title 'Tractatus duo: De Natura Elementorum; De Quinta Essentia' (1621).

Dreber, Heinrich, known as **Franz-Dreber**, German painter; b. Dresden 9 Jan. 1822; d. Anticoli di Campagna, near Rome, 3 Aug. 1875. He began his art education at the Dresden Acad-

DRED — DRED SCOTT CASE

emy, and became a pupil of Ludwig Richter, whose idealistic style he copied. He went to Rome in 1843 at the expense of the Dresden Academy. Two of his pictures are in the Berlin National Gallery, namely 'An Autumn Morning in the Sabine Mountains'; and 'The Hunt of Diana.' A landscape, with the figure of the 'Good Samaritan' is to be found in the Dresden gallery.

Dred, A Tale of the Great Dismal Swamp, a novel by Harriet Beecher Stowe, published in 1856. It belongs to the literature of the slavery agitation in the United States, and deals with the experiences of a fugitive slave. It is also called 'Nina Gordon.'

Dred Scott Case, the most far-reaching slavery case ever in the United States courts. Dred, born in Missouri about 1810, was a slave of Dr. Emerson, an army surgeon, who took him in 1834 to Rock Island, Ill., and May 1836 to Fort Snelling, Wisconsin Territory (now Minnesota), where he married Harriet, a slave of his master, and had two children. Slavery was illegal in both places: in Illinois by its Constitution, in Wisconsin (upper Louisiana Purchase) by the Missouri Compromise. In 1838 he was taken back to Missouri—Saint Louis.

Here in 1848 was living the eminent free-soil lawyer, Francis P. Blair, jr. He learned of Dred's migrations, and wishing to test the right of slavery to reclaim persons once free, induced Dred on being whipped by his master to sue for assault and battery in the State circuit court of Saint Louis County. Blair and his free-soil friends furnished funds and legal assistance. The suit was sustainable only if Dred was a free citizen charging violence from another citizen; and the court held that his residence on free soil had made him free, and there was no legal power to re-enslave him. Appeal was taken to the supreme court of Missouri, which reversed the decision, the two associate justices against the chief justice, decided that Emerson had only made a temporary change of domicile in obedience to government orders, that his property was held according to the laws of his permanent domicile, and that Scott's servile character was merely in abeyance and fully resumed on return to Missouri; refused to consider the Illinois Constitution or the Missouri Compromise as relevant, and sent back the case to the circuit court.

Meantime Emerson had sold Dred and his family to John F. A. Sandford of New York and suit was brought against Sandford for assault and battery in carrying off Scott—this time in the Federal circuit court for Missouri, on the constitutional ground that he was a citizen of a different State from Sandford. Sandford denied jurisdiction on the ground that Dred was not a citizen but "a negro of African descent," progeny of negro slaves. Dred's counsel demurred (admitted the facts but denied their sufficiency), claiming that being a negro did not prevent his being a citizen; the court sustained him. Sandford denied assault and battery, claiming that he had only "gently laid hands" on him to coerce him, as was his right toward a slave; the court instructed the jury that this was law; Dred's counsel took exception, and the case went up to the United States Supreme Court.

It was argued at the December terms of 1855

and 1856. Montgomery Blair (brother of Francis P.) and George Ticknor Curtis (brother of Judge Curtis) were counsel for Scott, Reverdy Johnson, and Henry S. Geyer for Sandford; all gratuitously. Justice Nelson prepared a brief abstract of the decision; but the public excitement over the slavery question was so intense and menacing to the Union (just after the Buchanan-Fremont election), that it was decided to have Chief Justice Taney write a full and careful review of the whole law on the subject of slavery, in hope of making the members of the free-soil party accept it contentedly and cease their agitation. Taney and six assistant judges concurred against Scott; Curtis and McLean dissented.

The written decisions were withheld from the public till 6 March 1857, two days after the inauguration, to avoid embroiling Pierce's last months. The decision proper was essentially the same as that of the supreme court of Missouri; that Dred Scott as a negro was not a citizen of the United States within the intent of the Constitution, and therefore the circuit court had no jurisdiction and the suit should be dismissed. This decision remained United States law, an irremovable barrier in the way of granting civil rights to the colored race, till the passage of the Fourteenth Amendment (see CONSTITUTION, *Amendments*).

Unfortunately, the court did not confine itself to the case before it; but for the reasons above mentioned, and to answer for the public the arguments brought forward by counsel, who went out of their way to deliver a series of *obiter dicta* (personal judgments not needed or relevant for the case in hand, and therefore not law), which inflamed the public wrath immeasurably as a fresh aggression of the slave power, have remained in public memory as the only interesting points in the case, and are, in fact, by far the most important aspects of it. These were three: in essence, that African negroes had never been recognized in American law or custom as persons; that Congress had no power to make regulations for the Territories acquired after the Constitution was adopted, except under the Constitution, which recognized slaves as property; and that the Missouri Compromise, already repealed by the Kansas-Nebraska Bill, had never been constitutional. (1) Of course no exception had been taken by Scott's counsel to the circuit court's ruling that negro blood was no bar to citizenship; but the Supreme Court dragged it in and overruled it. In the counsel's statement of the condition of public opinion at the time of framing the Constitution, they used a phrase which is immortal in public memory, and usually supposed to be their own decision as a point of present law: that negroes were then regarded as "so far inferior that they had no rights which the white man was bound to respect," and to be rightfully made slaves for white men's benefit. The Court held that they were regarded in the Constitution as only chattel property; were not included in the words "people" or "citizens" in the Declaration of Independence, the Articles of Confederation, or the Constitution, remained in this condition of civil nullity even when emancipated, had no rights except such as each State chose to grant them, and could not become citizens capable of suing or being sued. The dissenting judges pressed.

DREDGE — DRELINCOURT

the notorious distinction between citizenship and suffrage (see CITIZEN); called attention to the Constitution's repeated mention of the negroes as "persons," and to the fact that free negroes were actually voters in five of the States in 1787, and were so even yet save where the States had changed their constitutions to disfranchise them; and held that the civil rights of free negroes were the same at least as those of women and minors. (2) As to the Territories, the *obiter* decision was that as the Constitution admitted slaves to be property, and by the Fifth Amendment, Congress had no right to take away any citizen's property without compensation, it had no right to make laws barring slave property from the Territories more than any other: that its rules and regulations must be in conformity with the Constitution. The dissenting judges held that both by common law and the Constitution slavery was a purely State institution (cf. Art. IV., § ii., par. 3: "No person held to service or labor in one State," etc.), sustainable only by State law and State police power of quelling resistance; that once out of the State's power, a slave instantly became free by the law of nature, and that State law could not follow him to the Territories. (3) The decision that the Missouri Compromise was unconstitutional, as interfering with the natural right of a slaveholder to take his property where he pleased, and with the constitutional equality of citizens of different States, followed from the Court's opinion on the second point. The dissenting justices held that the Compromise was a rightful exercise of the constitutional power of Congress to legislate for the Territories, and never before questioned since the government was founded; and that it did not violate the equality of citizens because citizens could only hold slave property in States that permitted and enforced it.

The whole question was soon decided by the War. Scott and his family were inherited by Calvin S. Chaffee of Massachusetts (then in Congress), were conveyed by him to Taylor Blow of St. Louis for emancipation, and were emancipated 26 May 1857. See Decision in Howard's 'Report . . . in the Case of Dred Scott' (1857); Benton, 'Examination of . . . the Dred Scott Case' (1860); Tyler, 'Life of Taney' (1872); Curtis, 'Life of B. R. Curtis' (1880). The Missouri Historical Society has a portrait of Scott, from a photograph.

Dredge (from Ger. *tragen*), a mechanical device for the removal of soil and other solids from under water. See DREDGING; DEEP-SEA LIFE.

Dredging, the operation of removing mud, silt and other deposits from the bottom of harbors, canals, rivers, docks, etc., by mechanical means. The most simple dredging apparatus is the spoon apparatus, which consists of a strong iron ring or hoop, properly formed for making an impression upon the soft matter at the bottom, so as to scoop it into a large leather bag attached to the ring and perforated with a number of small holes. The means for working it is a long handle, a suspending rope, and a crane or sweep-pole planted in a boat. This primitive apparatus was formerly used in the canals and ditches of the Netherlands. Much more effective is the steam dredging-machine now in common use. It is said to have been first applied by Boulton and Watt for use on

the Weir at Sunderland, England, in 1796. It has a succession of strong iron buckets on an endless chain running on a frame, the lower end of which is vertically adjustable so as to regulate the depth at which it works. The buckets tear up the matter at the bottom, raise it, and discharge it into barges or hoppers stationed close to the dredging vessel. The Suez Canal was excavated by means of a ladder dredge with a long chute and supporting girder. The material excavated was carried in boxes on a sort of tramway and tipped out on the bank.

In excavating at Hell Gate and Flood Rock Reefs, at New York, a barge measuring 120 feet in length, 44 in beam, and 15 in depth, used a grapple which weighed 15 tons and lifted boulders of 70 tons. In some cases the current of river or tides has been utilized in dredging channels. In bottoms of mud or loose sand the steam pump or hydraulic dredger may be used. The watery material is pumped out and deposited on the shore; the water drains away, leaving the sand or mud. By this means more than 3,000 cubic yards a day can be excavated at an extremely low cost. Great improvements have been made in hydraulic dredges, and some built in recent years for use in the Mississippi River have a capacity of over 1,000 cubic yards per hour.

Dredging is also the operation of dragging the bottom of the sea in order to bring up oysters, or to procure shells, plants, and other objects for scientific observation. The oyster dredge is a light iron frame with a scraper like a narrow hoe on one side, and a suspending apparatus on the other. To the frame is attached a bag made of some kind of netting to receive the oysters. The dredges used by naturalists are mostly modifications of or somewhat similar to the oyster dredge. Scientific dredging has of late assumed a high importance as making us acquainted with the life of deep-sea areas. See DEEP-SEA LIFE.

WILLIAM H. HEUER,
Corps of Engineering, U. S. Army.

Dreibund. See TRIPLE ALLIANCE, THE.

Dreiser, Theodore, American journalist: b. Terre Haute, Ind. 27 Aug. 1871. He was educated at the State University of Indiana. From 1891 to 1895 he was in newspaper work in Chicago, St. Louis, and Pittsburg. He edited 'Every Month,' a musical periodical, 1895-7, and then engaged in special work for the 'Cosmopolitan Magazine.' He has written: 'Sister Carrie'; 'Studies of Contemporary Celebrities'; 'Poems.'

Dreissena, drīs'sē-nā, a genus of freshwater lamellibranch mussels of the *Dreissenidae* family, so named from Dreyssen, a Belgian naturalist. *D. polymorpha*, a native of the Caspian and Aral rivers and seas, is a well-known species in the rivers and estuaries throughout western Europe, including Great Britain, where they were accidentally introduced, probably on imported timber.

Drelincourt, Charles, shārl drē lān koor, French Calvinistic clergyman: b. Sedan 10 July 1595; d. Paris 3 Nov. 1669. He was the author of many controversial works, and of a book entitled 'Les Consolations de l'Ame Fidèle contre les Frayeurs de la Mort,' translated into English under the title, 'The Christian's Defense Against the Fear of Death' (1675). To promote the sale

DRENTHE—DRESDEN

of the English translation of this work, De Foe, it is said, wrote his 'Apparition of Mrs. Veal,' which was published along with the fourth edition of it in 1706. His son CHARLES (1633-9) became professor of medicine and anatomy at Leyden, and was appointed physician to William, Prince of Orange, afterward William III. of England.

Drenthe, drĕn'tĕ, a province of Holland, the principal wealth of which is obtained from breeding horses and rearing superior cattle, sheep, swine, and poultry of all kinds. Its capital is Assen. Pop. 148,542.

Dresden, Germany, capital of Saxony, situated in a valley on the river Elbe. On the left bank are the Altstadt (Old Town), Friedrichstadt, and other quarters, and on the right the Neustadt (New Town), and the Antonstadt. The municipal area received a large extension in 1897. The portion on the right bank called the Neustadt since 1732 is really the older, and was formerly known as Old Dresden. Among the structures worthy of notice are the five bridges across the Elbe, noted for their solidity, the first built in 1173; the Sophienkirche or Protestant Court Church; the Roman Catholic Court Church, which contains several fine pictures; the Church of Our Lady, an imposing edifice; the Church of St. John; the royal palace; the law courts; the Museum, a beautiful building, containing a famous picture gallery and other treasures, and forming a wing of the building known as the Zwinger, which contains zoological and other collections; the Japanese Palace (Augusteum), containing the public library of from 300,000 to 400,000 volumes, besides a rich collection of antiquities; the Johanneum, now containing the collection of porcelain and the historical museum, a valuable collection of arms, armor, domestic utensils, etc., belonging to the Middle Ages. The royal palace is unattractive externally, but has a fine interior adorned with frescoes, and the Green Vault contains a most valuable collection of jewels and small works of art. The court theatre forms a large and splendid edifice designed by Gottfried Semper, begun in 1871, and opened on 2 Feb. 1878. There is a fine park of 300 acres. The city is distinguished for its excellent educational, literary, and artistic institutions, among which are the Polytechnic School, organized much on the plan and scale of a university; several gymnasia and schools of the first rank; a military academy; the Conservatory and School of Music; the Academy of Fine Arts; the Royal School, for drawing, modeling, etc. The manufactures of Dresden are not unimportant, and are various in character; the china, however, for which the city is famed, is made chiefly at Meissen, 14 miles distant. In Dresden are made articles in gold and silver, mathematical and surgical instruments, straw hats and plait, artificial flowers, gloves, leather, cigars and cigarettes, musical instruments, chemicals, perfumes, mineral waters, chocolate, playing-cards, etc. There are large breweries, and in the neighborhood there are coal mines, iron and glass works, and manufactures of chemical stuffs, etc. The commerce is considerable, and of late years, since the development of the railway system, the trade with foreign parts has considerably increased. A good deal of business is done with the upper

parts of the Elbe, by means of the steamers, which ply as far up as Tetschen.

The gallery of pictures, one of the finest in the world, was begun very early, but first became of much importance under Augustus II., king of Poland and elector of Saxony. It owes its most valuable treasures, however, to Augustus III., a prodigal monarch, who exhausted his country by his extravagances. He purchased the greater portion of the gallery of the Duke of Modena for \$900,000, and many single pictures, among them Raphael's masterpiece, the 'Madonna di Sisto.' This celebrated painting is in a room alone, no other picture being hung near it. The pictures number about 25,000, and in particular comprise many fine specimens of the Italian, Dutch, and Flemish schools. From the Dutch school there are, among others, some 40 Rubenses, 20 Van Dycks, over 20 Rembrandts, besides Ostades, Gerard Dows, Teniers, Wouwermans, etc. Of the old German school Holbein's 'Madonna,' a sublime work, is particularly distinguished. Of the French school there are many Claude Lorraines, Poussins, Le Bruns, and others. Of the Italian school the gallery is rich in pictures of Correggio, including his famous 'La Notte,' or 'Holy Night'; of Raphael, the 'Madonna di Sisto,' the 'Madonna della Seggiola,' and others. There are also works of Leonardo da Vinci, Giulio Romano, Andrea del Sarto, Battoni, Titian, his famous 'Venus' and 'The Tribute Money,' Garofalo, Paolo Veronese, Guido Reni, Carracci, Carlo Dolce, and every distinguished Italian painter. Many modern painters are represented in this gallery, among them Hofmann, and several specimens from the Düsseldorf school. Murillo and Velasquez are remembered by one picture each. This collection is liberally open every day to all visitors. Besides this fine gallery of pictures the Museum contains also a collection of engravings and drawings, in all amounting to upward of 350,000. There is here also a rich collection of casts exemplifying the progress of sculpture from the earliest times, and including copies of all the most important antiques, made under the direction of Raphael Mengs, in Italy. The collection of antiques in the Japanese Palace contains some excellent statues, among which are distinguished three female figures from Herculaneum. The Johanneum Museum contains a historical museum and a large variety of specimens of Chinese, Japanese, East Indian, Sèvres, Meissen, etc., porcelain ware arranged chronologically. Dresden being thus rich in treasures of art, and favored by a beautiful natural situation, is the summer resort of many foreigners.

Dresden is of Slavonic origin, and first came under German and Christian influence after the subjugation of the Slavs about the year 922. At the beginning of the 13th century it is mentioned in documents as a city, and as a residence of the margraves of Meissen. Since 1485 it has been the residence of the rulers of Saxony. In the first half of the 18th century it was greatly embellished, but suffered much in the Seven Years' war. In 1760 for nine days it was bombarded by Frederick the Great. The Austrians occupied the city in 1809 without injuring it. The campaign of 1813 was most ruinous for the city and its environs. From May till about the middle of September it was held by Napoleon, and severe fighting in and around the city took place almost every day. After some years

DRESDEN — DRESS

of war and suffering, on 7 June 1815, peace and industry returned to the "German Florence," as Herder calls Dresden. After that time dwelling houses, gardens, and parks took the place of the former fortifications. During the revolutionary movement of 1849 it suffered severely. In 1866 it was occupied by the Prussians, but was evacuated in the following spring. It has been greatly beautified and extended in recent times (especially under the auspices of King John), and its population is rapidly increasing. Pop. (1900) 395,349.

Dresden, Battle of, a battle fought in 1813, when an allied army of 150,000 Russians, Austrians, and Prussians, commanded by Prince Schwarzenberg, sought to regain possession of Dresden, which was occupied by 20,000 French troops under Saint-Cyr. The Allies appeared before Dresden on 25 August, but Schwarzenberg did not attack until the following morning, when each division drove back the French and gained advantageous positions in the city, so that it appeared as if Saint-Cyr would be forced to capitulate. In expectation of reinforcements and satisfied with the morning's achievements, Schwarzenberg at noon called a halt. The delays proved fatal. Napoleon, who had gone to the support of Ney, against Blücher in Silesia, on learning of the Allies' march on Dresden, had hastened back, and during Schwarzenberg's unfortunate halt, French reinforcements were flocking across the Elbe, so that at 4 o'clock in the afternoon, when the Allies resumed the attack, there were 100,000 troops, who easily opposed all their efforts and drove them from their hard-won positions. Darkness stopped the conflict, which Napoleon resumed early the next morning, the fight continuing throughout the day until a strategic cavalry charge under Murat in the rear of the Austrians broke their line of resistance and practically ended the battle, the Allies beginning their retreat into Bohemia at 4 in the afternoon. The French took over 20,000 prisoners, while the killed and wounded on either side were estimated at between 7,000 and 8,000.

Dresden China, a delicate, semi-transparent, highly finished china made at Meissen, near Dresden. The manufacture resulted from an accidental discovery made by Böttger, a young chemist, in 1710, and the vases, statuettes, groups of figures, candelabra, clocks, etc., manufactured during the 18th century are highly prized. They are more remarkable for excellence of execution than for purity of design.

Dress, the clothing or apparel of the human body. Under this title may be considered the subject of the principles underlying the wearing of clothes rather than the minute details of their shape and color, which will be found under the title **COSTUME**. The evolution of dress has always been associated with the growth and decline of nations, and throws much light on racial characteristics. In the earliest stage of human history dress must, of course, have been strictly utilitarian, consisting only of the covering necessary to protect the body against the extreme conditions of climate and temperature. The same conception of dress exists to this day, undeveloped, among many uncivilized races.

At the beginning of civilization, a new element enters into the way in which dress is

regarded. Clothing becomes a means of marking the distinction of rank and office in the community. The minimum of clothing is found, with these races, only among slaves and the lowest classes in general, while garments even more complete than would be required by any considerations of modesty or of warmth begin to be worn by those in the higher ranks. Climate has still, of course, an influence concurrent with that of the new principles. The Assyrians covered themselves entirely with heavy draperies, stiff with embroidery. The Egyptians of whose dress we have the earliest records, clothed themselves in thin materials which revealed the lines of the body, frequently leaving the limbs exposed. Their dress was rich in texture and splendid in coloring, the designs of their textile fabrics being of high artistic excellence and beauty. Class distinctions were very strongly marked in their dress. A peculiar feature of the priestly garb was the leopard-skin worn on solemn sacrificial occasions. Women of rank wore beautiful embroidered skirts secured at the waist by a colored sash, or suspended by straps from the shoulders, and over this a long, loose robe. The laboring people used woollen fabrics, but their costumes, especially when at work, consisted as a rule simply of a loin-cloth and girdle. Among the Chinese the predominating idea in dress has always been splendor of material and decoration. The intense conservatism of this race is nowhere better shown than in the slightness of variation in dress from early times to the present. It will be observed in general that when a race makes a great, and especially a sudden, advance in civilization, it breaks away concurrently from its old traditions in the matter of dress. This is illustrated in the case of the modern Japanese. For a long time the figure was merely draped in loose lengths of material, with no attempt at conforming to the lines of the body or limbs—though sleeves and trousers are occasionally observed, as in the Persian sculptures at Persepolis. The primitive sandal was evidently thought to afford all necessary protection to the foot, until the time of Assur-bam-pal, or Sardanapalus, when soldiers and hunters are found to have worn a sort of net to protect their legs, and boots or gaiters somewhat like the Greek and Roman *cothurnus*, laced in front. Hats or caps were not, outside of official costume, much worn in early times. Even in the time of Julius Cæsar, they were little used except by travelers, most people preferring a fold of the toga or mantle for a head-covering. Among the Greeks and Romans the division of classes and professions by dress was very noticeable. By the Greeks the artistic effect was carried to a height hitherto unknown, their garments being the perfection of grace and dignified elegance. At no other time has the dress of a nation been of such advantage to the artist. The Greek *chiton* and *himation* of about 450-350 B.C. were the highest type of loose clothing, while the highest type of the more tightly fitting costume was found in England and France about 1350. The costumes of western Europe during the last quarter of the 14th and the first of the 15th century, were, in fact, characterized by a beautiful reasonableness and adaptation at once to use and artistic effect. But there have been other periods in which the exaggeration of good things brought about absurd

DRESS REFORM — DRESSER

degeneracy. The Norman conquest introduced a host of absurdities into England. Eccentricities in headgear especially prevailed. Shoes grew so long and pointed that they were an encumbrance to the wearer. Small waists were considered quite as essential for men as for women, and, even as late as the reign of George III. in England, tailors advertised corsets for gentlemen. The modern tendency in dress is decidedly in favor of discarding a difference of dress as a means of class distinction. The dress-reform movement of the 19th century, and the greater attention paid to hygienic considerations, have resulted in making the health and comfort of the body more important factors than they have been for many centuries. Extravagance in dress has always been a mark for social and religious reformers. Sumptuary legislation has attempted, time and time again, to regulate it, but usually without success. Both in France and in England, especially during the Puritan period in the latter country, preachers thundered from many a pulpit against the senseless fashions of their times. There are two satirical literary treatments of this aspect of dress which are especially famous, that of Swift, in the 'Tale of a Tub,' and that of Carlyle in 'Sartor Resartus.' See DRESS REFORM.

Dress Reform, a movement of the 19th century, having for its aim the modification of the dress of women along hygienic lines chiefly, but also with regard to comfort and convenience. Many forms of feminine apparel had long been operating against the health of the wearers, and the injurious effects had been more or less frankly discussed and recognized in private circles before leaders were found with sufficient earnestness and courage to undertake organized efforts for reform. A few years before the Civil War a National Dress Association was started, but made little headway. It was not until a similar society was organized in Boston in 1874 that attempts of this nature began to bear much fruit. Several causes contributed to make the time more propitious for an active propaganda against tight-lacing, high-heeled, and cramping foot-wear, trailing garments, etc. The greater attention paid to physiology in schools removed to some extent the ignorance which had been a partial excuse for unhygienic methods of dress. The increasing number of women receiving a college education insured for the new ideas an audience with minds too liberal and judgments too sound to be rigidly fettered by conventionality and fashion. A third factor not to be disregarded was the attitude of physicians. Prevention of disease and the development of normal conditions was becoming the watchword, where curative measures had formerly been emphasized. The co-operation of the medical fraternity by lectures, periodical literature and personal influence should have due recognition in the cause of dress reform. Such co-operation was a marked feature of the movement inaugurated in Boston. As the century drew to a close, conditions became still more favorable. The prominence given to bacteriology associated in innumerable minds the trailing skirt with germ-transportation. The investigation of the relative values of the different fabrics, cotton, linen, silk, and woolen, as material for underwear (a discussion in which Germany took a notable part), was very timely. It

called attention to the great lack of judgment exhibited by many persons, especially women, in protecting themselves by suitable undergarments against the changes of the season, and especially the sudden variations of the American climate. The adoption of outer garments suitable for wet weather was undoubtedly hastened by the vogue of the bicycle skirt that accustomed the eye to a style of garment once attracting unfavorable comment, or at least unwelcome observation. Rainy-day clubs have been formed in many cities and have done their share toward the introduction of the short skirt. The fact that a great number of women are now daily going to business has aided in bringing about a change in favor of simple, comfortable, and convenient garments. To athletics, also, dress reform is deeply in debt. The present popularity of out-door exercise and sport for women, and the general interest taken in physical culture have inevitably tended to modify the form of women's garments.

The practice of lacing, with its vicious results of molding the form into abnormal lines and crowding the vital organs, will undoubtedly persist among a certain class of women; but thousands are learning to admire and aim at the vigor and grace that can be obtained only by freedom of movement. Aesthetic considerations had little effect upon the earliest dress-reformers, such as Mrs. Amelia Bloomer and a few other woman suffragists who first braved public opinion by a radical change of costume. The Turkish trousers and very short skirt of Mrs. Bloomer did not invite imitation; but later phases of the reform, both in England and in America, have aimed at grace and beauty as well as health and convenience in the style of garments advocated. In the United States Mrs. Annie Jenness Miller has been a prominent exponent of the more artistic aspect of the subject. Very near the time of the establishment in this country of the second National Dress Association, an attempt was made by the crown-princess of Saxony to awaken her fellow countrywomen on the subject of dress reform, the hygienic side of the question being most prominent in that effort. In England a movement begun during the same decade was marked by aesthetic features. To retain the natural beauty of the human form, and succeed in its harmonious appareling were the aims of some of the dress reformers. There was, however, side by side with this movement, one having a utilitarian trend. This was allied to the German movement in favor of more hygienic garments; the combination of lightness and warmth in the material used being a great desideratum. Organized effort along the line of dress reform in England has resulted in the formation of the Rational Dress Association and the National Health Dress Association. There is also a society having for one of its aims a change in the customary mourning apparel. Outside of Germany and England, little interest has as yet been shown in Europe on the subject.

Dresser, Henry Erles, English ornithologist: b. Thirsk, Yorkshire, 9 May 1838. He is best known by his 'History of the Birds of Europe,' in eight volumes (1871-81).

Dresser, Horatio Willis, American author: b. Yarmouth, Maine, 15 Jan. 1866. After a varied career he became identified with one of the so-called "new thought" movements, of which

DREUX — DREWRY'S BLUFF

He is now a prominent representative. Since 1893 he has lectured and written extensively on practical philosophy and metaphysics, and he edited and published the 'Journal of Practical Metaphysics' 1896-8; but it must be pointed out that these terms, as used by him and his school of thought, have meanings entirely different from those in which they have hitherto been used and are generally understood. He is the author of: 'The Power of Silence' (1895); 'The Perfect Whole' (1896); 'In Search of a Soul' (1897); 'Voices of Hope' (1898); 'Methods and Problems of Spiritual Healing' (1899); 'Education and the Philosophical Ideal' (1900); 'Living by the Spirit' (1900); 'Voices of Freedom' (1899-1900); 'The Christ Ideal' (1901); 'A Book of Secrets, with Studies in Self-control' (1902).

Dreux, drê (ancient DUOSCASSÆ), France, one of the oldest towns on the Blaise, 20 miles north-northwest of Chartres. It has a number of churches and other buildings of the 11th, 12th, and 13th centuries. It has some manufactories, but its trade is chiefly local. Pop. 9,000.

Drevet, drê-vâ, French family of engravers. (1) **PIERRE**: b. St. Colombe, near Lyons, 1664; d. Paris 1739. He was particularly successful in the engraving of portraits. (2) **PIERRE IMBERT**, his son: b. Paris 1697; d. there 1739. He studied with his father, but surpassed him in art. He, too, was most successful in portrait work, one of his best pieces being a portrait of Bossuet after Rigand; he also copied the works of Coypel, Restout, Andray, and other French painters of the time. (3) **CLAUDE**, the nephew of Pierre Imbert: b. Lyons 1710; d. Paris 1782. He was the pupil of his uncle, and copied his style without equaling his art.

Drew, Daniel, American capitalist: b. Carmel, N. Y., 29 July 1797; d. New York 19 Sept. 1879. In early life he was a cattle drover and was subsequently prominent as a steamboat builder, but was most widely known from his connection with railroads and as a leading stock speculator in Wall Street. He was the founder of the Drew Ladies' Seminary at Carmel, and the Drew Theological Seminary (q.v.) at Madison, N. J. He also gave large sums of money to various Methodist colleges and schools.

Drew, John, American comedian: b. Dublin, Ireland, 3 Sept. 1825; d. Philadelphia, Pa., 21 May 1862. He made his first appearance at the Bowery Theatre, New York, in 1845, and later became manager, in connection with William Wheatley, of the Arch Street Theatre in Philadelphia. He acted in the principal cities of the United States, England, and Australia.

Drew, John, American actor: b. Philadelphia, 13 Nov. 1853. He is a son of the preceding and first appeared at his father's theatre in that city, and for a short season played there with Edwin Booth. He visited Europe in 1892 with Daly's company, playing classic roles, and began his starring tours in the autumn of 1892, playing in 'The Masked Ball.' In 1901 he reduplicated some of his earlier successes in 'The Second in Command.'

Drew, Mrs. John. See **DREW**, LOUISA LANE.

Drew, Louisa Lane, American actress: b. London, England, 10 Jan. 1820; d. Larchmont, N. Y., 31 Aug. 1897. She was the wife of John Drew (1825-62) and for a whole generation stood at the head of comedy actresses. Her

greatest success was as Mrs. Malaprop in 'The Rivals,' and as late as 1895 she assumed that character in some special performances given by veterans of the stage, such as Joseph Jefferson, etc. After her husband's death Mrs. Drew managed the Arch Street Theatre in Philadelphia for a number of years.

Drew Theological Seminary, in Madison, N. J., an educational institution founded by the Methodist Episcopal Church for the education and training of its ministers. Daniel Drew donated the ground and buildings. Tuition is free and arrangements have been made whereby the cost of student life is most moderate. In 1902 there were enrolled 180 students with seven professors. In the library were 76,000 volumes.

Drewry's Bluff, Va., an eminence on the James River, near Fort Darling, eight miles south of Richmond. See **DREWRY'S BLUFF**, BATTLE OF.

Drewry's Bluff, Battle of. When Gen. Grant began his campaign for Richmond in May 1864, Gen. Butler, commanding the Army of the James, was directed to be well up James River toward Richmond by daylight of the 5th and to push ahead with all energy. By the 6th Butler had reached and entrenched at Bermuda Hundred Neck, Kautz's cavalry division, moving from Suffolk, destroyed several bridges on the Norfolk & Petersburg and Weldon railroads and joined Butler on the 10th. On the 9th Butler advanced with the greater part of his force to strike the railroad connecting Richmond and Petersburg, but his advance was barred by Swift Creek, which was found impassable, and its bridges heavily guarded, upon which he ordered his troops to withdraw to their entrenchments, but the withdrawal was not effected without an attack by the Confederates on a detachment of the 10th Corps, in which the loss was severe on both sides. Butler's advance was barred by strong works on Drewry's Bluff, on the right bank of the river, eight miles below Richmond. The works could not be reached by the navy, and on the land side the Bluff was defended by 22,000 infantry and over 2,000 cavalry, field artillery, and heavy guns. On the 12th Gen. Butler moved along the turnpike and after some fighting the Confederates fell back toward Drewry's Bluff. On the 15th there was heavy all-day skirmishing and some artillery firing, and Gen. Beauregard issued orders for an attack next morning to cut Butler off from Bermuda Hundred and capture or destroy his army. The attack was made very early in the morning, under cover of a dense fog; the right of Butler's line was turned and a large number of prisoners taken, compelling it to fall back a short distance. On the left Butler's line held its ground and made some progress, but toward evening Butler ordered his troops to fall back, and at night they were in their entrenchments at Bermuda Hundred. Beauregard followed and entrenched in front of Butler's lines. As Gen. Smith says, "Both corps re-entered the historic bottle, which was at once carefully corked by a Confederate earthwork." On the 20th Beauregard assaulted and carried some of Butler's advanced lines and a sharp fight ensued to regain them, which was only partially successful, a portion of them being retaken by Howell's brigade of the Tenth corps, which lost 702 men;

DREXEL — DREYFUS

the Confederate loss was nearly 800. On the 29th Gen. Smith with three divisions of the Tenth and Eighteenth corps, 16,000 men, and 16 guns, left the Army of the James and joined the Army of the Potomac, in time to take part in the battle of Cold Harbor. The Union forces engaged in the Battle of Drewry's Bluff, 16 May, numbered about 16,000; the Confederates about 18,000. The Union loss, 14-16 May, was 390 killed, 2,380 wounded, 1,390 missing. The Confederate loss, 16 May, was about 460 killed, 2,060 wounded, 212 missing. From 5-31 May, including all of Butler's engagements and Kautz's cavalry operations, the Union loss was 609 killed, 3,769 wounded, 1,580 missing; the Confederate loss for the same period cannot be definitely ascertained, but it was less than that of the Union forces. See 'Official Records,' Vol. XXXVI.; 'Butler's Book'; Grant, 'Personal Memoirs'; Humphreys, 'The Virginia Campaign of 1864-5'; Roman, 'Military Operations of Gen. Beauregard,' Vol. II.; and 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Drexel, Anthony Joseph, American banker; b. Philadelphia, Pa., 1826; d. Carlsbad, Germany, 30 June 1893. He became the head of the well-known firm of Drexel & Company, Philadelphia, having been identified with it from the age of 13. He was zealous in promoting science and art, especially music, and contributed largely to philanthropic and educational interests. The Drexel Institute of Art, Science and Industry, Philadelphia, dedicated 18 Dec. 1891, was established by him, the building costing over \$600,000 with an endowment fund of \$1,000,000.

Drexel Institute of Art, Science, and Industry was founded at Philadelphia in 1891, by Anthony J. Drexel (q.v.). This school was established for the purpose of giving young men and women opportunity to receive training in the arts and sciences as applied to the industries. The requirements for admission depend upon the course which the applicant wishes to pursue; no degrees are given. The buildings and equipments, given by Mr. Drexel, cost over \$4,000,000; and the amount of endowment, given also by Mr. Drexel, is \$2,000,000. The courses offered are: Fine and applied arts; elective engineering; commerce and finance; mechanical drawing and machine construction; domestic science; mathematics; physics; chemistry; and English. Day and evening classes are provided for all departments. The length of time required to complete the work depends upon the course. The free public lectures provided by the Institute are valuable educational factors.

The department of commerce and finance consists of three special departments: First, the course in commerce and finance; second, the office course; third, the evening course. These courses are founded on a broad and liberal basis, resembling generally the commercial schools of Europe, and they are intended to place commercial education in its proper relation to other departments of educational work. The object of the course is to train the young to do business rather than simply to record business. It provides a liberal and practical course of study for a two years' training in the knowledge of the world's industries and markets, the laws of

trade and finance, and the mechanism and customs of business. The first special department is intended to give a thorough fundamental training for the activities of business which include: (1) The production, sale, and transportation of articles of commerce; (2) the management of stock companies and corporations; (3) the buying and selling of securities; (4) the importing and exporting of merchandise; (5) the borrowing and lending of money and credit; (6) the advertising of commercial concerns; (7) the keeping of business records. In addition three distinct office courses are offered, practical in character and designed to prepare the student for entering immediately upon the respective lines of employment to which the training leads. In 1895 a beginning was made toward the formation of a permanent commercial museum. The collection now represents quite fully the following industrial products: Flour, wool, petroleum, tea, coffee, sugar, cotton, copper, iron and steel, glass, tobacco, leather, paper, wood, carpets, linen, spices, aluminum, building stone, brick, and terra-cotta. The art museum contains collections representing the industrial arts of Egypt, India, China, Japan, and Europe. The library contains about 30,000 volumes, and is supplied with books, periodicals, and pamphlets bearing upon the work, and every facility and assistance is afforded for the study of financial, economic, and commercial questions. In 1902 the number of students in attendance in the day classes was 1,200 and in the evening classes 2,000. Applicants for admission to any course must pass satisfactory examinations in English, geography, arithmetic, and United States history. For admission to the course in commerce and finance or to any of the office courses the candidate must be at least 16 years of age. The diploma of a high school of approved standing is accepted in place of an examination.

Dreyfus, drä-füs, Abraham, French playwright; b. Paris, 20 June 1847. He had a fine vein of kindly humor, and it pervaded both his contributions to the public journals and his theatrical compositions, which are mostly in one act. Among them are: 'A Gentleman in Black'; 'The Victim'; 'The Klepht'; 'A Break.' His four-act play, 'The St. Catharine Institution,' a comedy of manners, was brought out at the Odéon (1881); 'A Rupture' (1885); etc.

Dreyfus, Alfred, French military officer; b. Alsace 1859. He was a member of a wealthy Jewish family. On 14 Oct. 1894 he was arrested on a charge of communicating certain important military documents to a foreign government, and at a secret court-martial, on 19 December, and succeeding days, was found guilty and condemned to public degradation and lifelong imprisonment. He was degraded on 5 Jan. 1895, and in accordance with an act passed by the chambers was sent to the Ile du Diable (Devil's Island) near Cayenne, to undergo the other part of the sentence. On 1 June of the same year Col. Picquart became head of the Intelligence Department of the army, and in the course of his official duties discovered various circumstances which threw doubt on the correctness of the court-martial's decision, and pointed to another officer, of the name of Esterhazy, as the real

DREYFUS CASE—DRIFT

traitor; and in particular he obtained a copy of a telegram-card, subsequently known as the *petit-bleu*, alleged to have been addressed to Esterhazy by a German officer, Col. von Schwarzkoppen. On 7 Sept. 1896, he wrote to Gen. Gonse urging a reinvestigation of the case, and seven days later a newspaper divulged the fact that certain documents had been communicated to the court-martial unknown to the prisoner's counsel. Not long afterward a facsimile of the *bordereau* (memorandum, detailed list of documents), alleged to have been written by Dreyfus and largely contributing to his condemnation, was published in another newspaper, and on 16 November, Col. Picquart was superseded in his office by Col. Henry. On 15 Nov. 1897, M. Mathieu Dreyfus, brother of the condemned man, charged Esterhazy with having written the *bordereau*, but on 11 Jan. 1898 he was acquitted by a court-martial which sat with closed doors. On the following day Col. Picquart, who had been sent to Tunis after his dismissal from office, and had been afterward recalled to answer certain charges made by Esterhazy, was arrested and imprisoned. On 13 January, M. Zola, the eminent novelist, published in the *Aurore* a letter headed *J'accuse* (I accuse), in which he made serious charges against the general staff and the government in regard to the Esterhazy court-martial. After a stormy debate in the chamber it was decided to prosecute him; but the government steadily refused to reopen the Dreyfus case, declaring their determination to stand by the *chose jugée*. Zola's trial began on 11 February, and on the 23rd he was condemned to pay a heavy fine and to undergo a term of imprisonment. On 2 April the court of cassation quashed the sentence on Zola on technical grounds, but a fresh prosecution was ordered a few days later. On 27 June M. Cavaignac became head of the war office, and 7 July he read to the chamber several documents which he regarded as proving the guilt of Dreyfus, but three days later Col. Picquart wrote to the premier denouncing these documents as forgeries. This interference led to his rearrest, and shortly after Zola was again condemned. On 31 August Col. Henry was arrested, and confessed to having forged the chief document relied on by Cavaignac, but soon after his arrest he committed suicide. The war minister resigned 4 September, and was succeeded by Gen. Zurlinden. The latter resigned because of the government's determination to refer the question of revision to a commission, and on 18 September Gen. Chanoine succeeded him. The commission decided against revision, and on 26 September the government resolved to ascertain the view of the court of cassation. On 25 October the Brisson ministry resigned, and a few days later the court reported in favor of revision. On 31 October a new ministry under M. Dupuy came into office, and on 9 December the prosecution of Picquart was stopped by the court of cassation. On 16 Feb. 1899, M. Félix Faure, the president of the republic, died suddenly, and three days later was succeeded by M. Emile Loubet. On 3 June of the same year the court of cassation, having concluded its hearing of the evidence, ordered a fresh court-martial to be held at Rennes for the purpose of deciding whether Dreyfus communicated to a foreign government any of the documents mentioned in the *bordereau*, of which Esterhazy had previously

confessed himself to be the author. Picquart was released on 9 June, and on the 12th of the same month the ministry was defeated. On 22 June M. Waldeck-Rousseau succeeded in forming a new ministry. The new court-martial opened 7 August, under the presidency of Col. Jouaust, and about this time the press published accounts of the inhuman treatment of Dreyfus in his prison. Dreyfus, who had been brought to Rennes for trial, was defended by MM. Demange and Labori. The chief witnesses in favor of the prisoner were Col. Picquart and Capt. Freystätter, a member of the first court-martial, and against him were the Gens. Mercier, Gonse, Roget, de Boisdeffre, and Billot. An attempt to kill M. Labori on his way to court 14 August was fortunately unsuccessful. On 8 September M. Demange delivered a brilliant speech on behalf of the prisoner, but on the following day the judges, by five votes to two, declared the prisoner guilty, with extenuating circumstances. This verdict was so flagrantly opposed to the published evidence (this court-martial held most of its sittings in public) that it was received with indignation and contempt throughout almost the whole civilized world. Dreyfus was sentenced to 10 years' imprisonment in a fortress, but a subsequent full pardon from President Loubet set him at liberty. Several times during the progress of the case France seemed on the verge of revolution, and anti-Semitic fanaticism and insane glorification of the army proceeded to almost incredible lengths. The case lasted during the tenure of office of six ministries and formed a subject of official consideration for three presidents and nine ministers of war.

Dreyfus Case. See DREYFUS.

Dreyschock, Alexander, Bohemian pianist and composer: b. at Zack, Bohemia, 15 Oct. 1818; d. Venice 1 April 1869. After eight years' public concert performance he began to travel, in 1838, for the purpose of developing his art. In response to an invitation from the directors of the Imperial Conservatory, St. Petersburg, he visited that city. There he stayed from 1863 until failing health compelled him to seek a milder climate.

Dreyse, Johann Nikolaus von, yō'hän nīk'-o-lows fōn drī'zē, German inventor: b. Sömmerda, Erfurt, Prussia, 20 Nov. 1787; d. 9 Dec. 1867. He worked as a locksmith in Germany, and in a musket factory in Paris 1809-14. He then founded an ironware factory in Sömmerda, and began the manufacture of percussion-caps under a patent in 1824. In 1827 he invented a muzzle-loading, and in 1836 a breech-loading needle-gun, which was adopted in the Prussian army in 1840. A large factory was at once established, which produced 300,000 weapons between 1841 and 1863. In 1864 Dreyse was ennobled.

Drift, or **Glacial Drift**, a general name given to the deposits made by the ice sheets of

DRIFT SAND — DRILLS

the glacial period, or by the water which came from them. By some geologists the term is restricted to the unsorted deposits left by the ice itself, the deposits worked over by water being called stratified or modified drift. In this restricted sense drift includes (1) lateral and terminal moraines and (2) till, boulder clay or "hardpan," the sheet of clay that frequently covers rock surfaces in the glaciated regions. Drift is sometimes more or less sandy and always contains angular boulders with polished and often striated surfaces, the boulders being scattered through the clay without order. Usually the boulders are derived from rocks near by, but fragments of tough hard rocks were sometimes transported long distances before being ground up by the action of the ice. Thus boulders from the peridotite at Cumberland Hill, R. I., have been found in the till of Martha's Vineyard, Mass., over 30 miles distant. The exact method by which till was formed is in dispute among geologists, though it is generally regarded as the ground moraine of the ice sheet, in spite of the fact that present glaciers are not forming a similar deposit. The boulders in the till in New Zealand are sometimes as much as 20 feet in diameter and in some places the till is so full of boulders as to render the soil formed from it unfit for agriculture. In northwest Ohio the till in many places is over 100 feet deep and as it includes the detritus from softer rocks such as limestones, in that region boulders are fewer than in New Zealand and the resulting soil is very fertile. Englacal drift is the rock detritus carried along in the body of a glacier. See GLACIER; GLACIAL PERIOD; SOIL.

Drift Sand is sand thrown up by the waves of the sea and blown when dry some distance inland until arrested by large stones, tree roots, or other obstacles, round which it gradually accumulates until the heaps attain considerable dimensions. When these mounds have reached a certain elevation they are urged farther inland. "The same wind," says Cuvier, "that drives the sand from the sea upon the mound, drives the sand from its summit to its land side." In some parts of the coasts of France, the Landes of Brittany, in particular, these inroads upon the land have been attended with destructive consequences. The quantity of sand annually deposited along that coast is estimated at 3,000,000 cubic feet, and its annual progress inland some 72 feet. Such has been its destructive effects upon a village of Brittany that nothing is visible of it except a portion of the church steeple. For the purpose of arresting the inland progress of drift sand various measures have been adopted, the most successful being the planting of sand-loving plants with long creeping roots, such as *Carex arenaria*, which help to fix the sand and break the influence of the wind. In France the drift sands of the Biscay gales have been checked in their encroachments by the planting of fir-trees in solid belts along the shores.

Drill, a baboon of West Africa, the *Cynocephalus leucophæus*, closely allied to the mandrill (q.v.), whence its abbreviated name. It is, however, smaller than the mandrill, has a black face, and a short, erect tail, not two inches long.

Drill, Borer, or Snail-bore, a small muricine gastropod mollusk the American *Urosalpinx cinerea*, so named on account of its destructive

propensities in boring through the shells of young oysters and feeding on them. The drill occupies a spiral, brownish shell, about an inch long, and is found along the Atlantic coast north of Florida, becoming scarce above Massachusetts.

Drilling, sowing in parallel rows as distinguished from sowing broadcast. It was introduced into England by Jethro Tull, who published a work on the subject in 1731. He saw that mere plowing and rough harrowing were not cultivation, but only its rudimentary operations; and that the soil required to be stirred and pulverized, not only before sowing, but also after the plants had appeared above ground, in order that weeds might be extirpated and fresh particles of soil brought in contact with the roots of the crop. The plan of sowing in drills or ridges, and hoeing in the intervals was therefore adopted by Tull as the best means to attain his objects. The advantage of sowing in drills has stood the test of experience, and drill husbandry, by combining the advantages of continued tillage with those of manure and a judicious rotation of crops, is a marked improvement on the old mode of sowing all seeds broadcast. The crops which are now generally drilled are turnips, potatoes, beans, peas, carrots, clover, cereals, flax, etc. Drilling is of more importance on dry than on moist soils, as in the former weeds are more apt to spring up and injure the crops.

Drills, or Drilling Machines, instruments such as rock drills, percussion drills, diamond drills, etc., for perforating stone, metal, and other hard substances, as distinguished from wood-boring tools. Under the article BORING, descriptions will be found of these various machines, to which may be added that of the steel-shot core drill, a recent Australian invention, and an inexpensive substitute for the higher priced diamond drill. Mr. Davis, the inventor, first attempted the construction of a toothed bit or cutter made of hardened steel. With this he was successful in soft and moderately hard rock, but for the hardest formations he still had to use a diamond drill. It was not until he had invented the "shot bit" that the diamond drill could be entirely dispensed with. This bit is a soft steel cylinder in connection with which small chilled steel shot are used. The bit grinds the shot into the rock, thus gradually wearing it away, or to be more correct the action of the shot on the rock is one of crushing rather than grinding, and for this reason the smooth bearing surface of the shot bit shows but little wear.

The arrangement of the drill and its accessories is as follows: The hollow drill rods are rotated by any available geared driving means. The lower drill rod is surrounded by a "calyx" or tube, and the two are joined at their lower ends by a plug. The centre portion of the plug serves as a bearing for a protecting ring, and on its lower end a ring is threaded, while to this the core barrel is attached on which either the shot bit or the cutter can be threaded. The shot bit is provided with a triangular notch in its lower end, one of the walls of the notch being vertical and the other forming an angle of 30° therewith. The steel shot, which are fed through the hollow rods from the top, are carried by a current of water under this notch, and the inclined wall drags them under

the edge of the shot bit. The sizes of shot used vary with the nature of the rock to be drilled, some being as large as duck shot and the smallest being very much finer. The working edge of the shot bit is rounded, so that the shot grinds not only directly beneath the drill, but also to a certain extent at the inner and outer sides, thus cutting out proper clearance for the operation of the drill. Water is pumped into the hollow drill-rods through a pipe and passes out under the bit and up the annular space outside the core barrel, carrying with it the sludge or fine particles ground up by the shot. The current of water flows with great strength up as far as the top of the calyx, where the annular space widens considerably, so that the current is reduced and the sludge it carries drops by gravity into the calyx; the calyx, therefore, providing an additional record of formations penetrated. It is particularly useful when drilling with the cutter bit through matter which is too soft to form a good core.

The weight of the drill-rods is ordinarily sufficient to properly feed either the shot bit or the cutter. When additional pressure is necessary, this may be exerted by turning a hand-wheel geared to a pair of winding drums, on which are coiled the ends of a strap passing over pulleys at the top of the drill. When it is desired to remove the core, coarse gravel is poured down the hollow tubes, which wedges in between the core and core barrel so tightly that on lifting out the core barrel the core breaks away and comes up with it.

Drimys, *drī'mīs*, a genus of plants belonging to the order *Magnoliaceae*. They are distinguished by their bitter, tonic, and aromatic qualities. *D. winteri*, or *aromatica*, carried to Europe by Captain Winter from the Straits of Magellan in 1579, yields Winter's bark, which has been employed medicinally as an aromatic stimulant. It somewhat resembles canella bark. The bark of *D. granatensis* is used in Brazil against the colic. It is tonic, aromatic, and stimulant. That of *D. axillaris*, a native of New Zealand, has similar qualities.

Drink. See DIETETICS.

Drip Stone, a corona or projecting tablet or molding over the heads of doorways, windows, archways, niches, etc., to prevent rain-water from trickling down. Called also a label, weather-molding, water-table, and hood-molding. The term label is usually applied to a straight moulding. Also a filtering stone, so called by sailors.

Drisler, Henry, American classical scholar: b. Staten Island 27 Dec. 1818; d. New York 30 Nov. 1897. He was graduated from Columbia in 1839, was appointed tutor of Greek and Latin there in 1843, adjunct professor in 1845, professor of Latin in 1857, and of Greek in 1867. He was acting president of Columbia at the time of President Barnard's absence as one of the commissioners to the Paris Exposition in 1867, and again in 1888, and became dean of the School of Arts in 1894. He assisted Dr. Anthon in the editing of classical text-books, prepared a new edition of Liddell and Scott's Greek Lexicon, and co-operated on the seventh Oxford edition.

Drive, a course upon which carriages are drawn or horses driven, a road prepared for

driving. To be conveyed in a carriage; to travel in a vehicle drawn by one or more horses or other animals.

Driver, Samuel Rolles, English biblical scholar and divine: b. Southampton 2 Oct. 1846. He studied at Winchester, and New College, Oxford, was for some years a Fellow and tutor of his college, and from 1876 till 1884 a member of the Old Testament Revision Company. In 1883 he was appointed to the regius professorship of Hebrew at Oxford, at the same time becoming canon of Christ Church. Among his numerous works may be mentioned: 'A Treatise on the Use of the Tenses in Hebrew, etc.' (1874); 'Isaiah: His Life and Times, and the Writings which bear his Name' (1888); 'Notes on the Hebrew Text of the Books of Samuel, with Introduction on Hebrew Palaeography' (1890); 'Introduction to the Literature of the Old Testament' (1891), a work suited for popular reading, which has passed through a number of editions; 'Sermons on Subjects connected with the Old Testament' (1892); the Book of Leviticus (1891-8) in 'The Polychrome Bible,' with H. A. White; 'Commentary on Deuteronomy' (1895); 'Commentary on Joel and Amos' (1897); 'Commentary on Daniel' (1901). He was one of the editors of the 'Variorum Bible,' with various renderings and readings and valuable other aids to the study of the Scriptures, published by Eyre and Spottiswoode in 1880; and with Neubauer translated a series of Jewish commentaries on the 53d chapter of Isaiah. He is also joint editor of the 'Hebrew-English Lexicon of the Old Testament.'

Driver-ant, a nomadic predatory ant (*Anomma arceus*) of western Africa, which makes its forays in column-like masses, driving other animals in fear before it, and forcing the negroes out of their villages.

Driving. Driving vehicles or riding furiously and recklessly in a public place, to the danger of the lieges, is an offense at common law in England, and may be prosecuted as culpable neglect of duty according to the law of Scotland. It has, however, been made a statutory offense, and a long series of acts passed to regulate the misconduct of drivers of public carriages, under which prosecutions are now as a rule brought. In the United States, furious driving in cities generally is a misdemeanor punishable by fine and imprisonment. In the absence of State laws, municipalities regulate the rate of driving. In most cities pedestrians have the right of way at street and road crossings. See also COACHING; RIMING.

Drogheda, *drōh'ē-dā*, Ireland, seaport in the southeast of county Louth; on the river Boyne, four miles from its mouth; 32 miles north of Dublin, and 81 miles south of Belfast. In 1494, the Irish parliament, then in session at Drogheda, passed under compulsion, the "Poynning's laws," sometimes called the "Statutes of Drogheda." In 1649, Cromwell stormed the city and massacred the garrison. William III. took possession of the city the day after the "Battle of the Boyne." Pop. 11,873. See POYNING'S LAWS.

Drohobycz, *drō-hō'bīch*, Austria, town in Galicia, 41 miles south-southwest of Lemberg. It has an important trade, chiefly with Hungary, in corn, leather, linen, earthenware, and particularly salt, obtained from salt springs in the

DROITWICH — DROPSY

vicinity. Near the town are valuable iron mines and pitch wells. Pop. 17,784.

Droitwich, droit'ich, England, a market town, six miles northeast of Worcester, on the banks of the Salwarp. Droitwich is supposed to have been the Salinæ of the Romans, and some Roman remains have been discovered. It is still famous for its brine springs, rising near the centre of the town through strata of red sandstone and gypsum, and from which, as appears from grants to the church of Worcester, salt has been manufactured for more than 1,000 years. Pop. 4,256.

Drôme, drôm, France, a department, covered almost throughout by ranges of the Alps, the average height of which, however, does not exceed 4,000 feet; area, 2,518 square miles. Wines, olives, chestnuts, and silks are staple productions. Valence is the capital. Pop. (1901) 294,704.

Dromedary, the name of an improved variety of the one-humped camel (*Camelus dromedarius*), especially bred for riding owing to its extraordinary fleetness and power of endurance. It is able to travel at the rate of nine miles an hour, for many hours, without rest or food. Its ordinary gait is a trot; if forced to gallop, it soon gives up. See CAMEL.

Dromgoole, William Allen (Miss), American author: b. Murfreesboro, Tenn., 26 Oct. 1860. She was for several years engrossing clerk in the State capitol at Nashville, and after teaching school in Tennessee and Texas for a few years, took up the literary work in which she has since been engaged. She has written: 'The Heart of Old Hickory' (1895); 'Valley Path' (1898); 'The Farrier's Dog and His Fellow' (1899); 'Three Little Crackers from Down in Dixie' (1898); 'Rare Old Chums' (1898); 'A Boy's Battle' (1898); 'Cinch, and Other Tales of Tennessee' (1898); 'The Moonshiner's Son' (1898); 'Harum-Scarum Joe' (1889); 'The Battle on Stone River' (1899).

Dromios, The, two characters in Shakespeare's play the 'Comedy of Errors.' They are twin brothers of close resemblance, who had been separated early in life, and who meet as the respective attendants of Antipholus of Ephesus and Antipholus of Syracuse.

Drone, Eaton Sylvester, American journalist: b. Zanesville, Ohio, 25 Jan. 1842. He was graduated at Harvard 1866; was admitted to the New York bar in 1869; became the New York *Herald's* staff writer on legal subjects 1880, and later was made editor-in-chief of that paper. He has published: 'Law of Property in Intellectual Productions, in Great Britain and the United States, embracing copyright in works of Literature and Art, and Playwright in Dramatic and Musical Compositions' (1879).

Drone. See BEE.

Drone-fly, a dipterous insect (*Eristalis tenax*) of European origin, but first described as an American fly in 1870. It prevails from the Atlantic to the Pacific, and so closely resembles the honey-bee in size and color, that the two are often confounded. Living on the juices of flowers, particularly upon those of agreeable fragrance, it hovers about dwellings and windows late in the autumn.

Dron'go, or **Drongo-shrike**, a passerine bird of the family *Dicruria*, represented by many

species in Africa, Southern Asia, and Australia. The typical and most familiar species is the Indian *Dicrurus ater*. Of a glossy black color, it has the stout, hooked bill and forked tail of the shrike. Its food consists of insects, which it often captures on the wing. In India it is a common bird, where by Europeans it is called "king-crow" from its habit of routing crows and other large birds in defense of its nest.

Drongo Cuckoo (*Surniculus dicruroides*), an East Indian bird of the order *Picariæ*. It is especially interesting to biologists as a conspicuous example among animals of imitation, according to which one group of animals gradually assumes some characters of another and a different group, when such features are advantageous. Structurally, the drongo cuckoo is true to the picarian order, having the yoked toes—two in front and two behind,—and resembles the cuckoo, of the same order, in its habits of nesting and of egg-laying. But in other respects it exactly imitates the drongo-shrike, having the same description of plumage and color, with the furcated tail, and inhabits the same locality.

Drontheim, drönt'hîm. See TRONDHEIM.

Droogenbroeck, Jan van, yän vān droo'-gên-brêk, Flemish poet: b. St. Amand-on-Scheldt 18 Jan. 1835. He was long an educator of eminence, and issued his first verse collection, 'Ghazels and Makames' (Arabian terms for stanzas and songs) in 1866, under the pseudonym of JAN FERGUNT; his subsequent volumes, on Camoens and other important subjects, fully sustaining his reputation.

Droppers, Garrett, American educator: b. Milwaukee, Wis., 12 April 1860. He was graduated at Harvard 1887, and later studied at the University of Berlin 1888-9. From 1889 to 1898 he was professor of political economy and finance in the University of Tokio, Japan. He was secretary of the Asiatic Society of Japan and contributed to its 'Transactions' several important and valuable articles on Japanese currency questions. Since 1898 he has been president of the University of South Dakota at Vermilion, S. D. He has published a 'Translation of Schopenhauer's Essays' (1881).

Dropsy. This is a symptom rather than a disease. It consists of an accumulation of fluid in the subcutaneous tissues and serous cavities of the body. A number of localized forms of dropsy have received special names, such as dropsy in the abdomen—ascites; dropsy of the chest, hydrothorax; dropsy of the testicle, hydrocele; dropsy in the brain, hydrocephalus. The terms œdema and anasarca are also used as somewhat synonymous with dropsy; œdema meaning, however, more of a puffiness of certain portions of the body, and anasarca signifying a generalized and widespread dropsy. The main causes for the symptom known as dropsy are (a) insufficient strength of heart-action, allowing the serum of the blood to wander outside the blood vessels, and (b) some obstruction, preventing the return of the blood to the heart. The most important cause of dropsy is some disease of the heart and blood vessels whereby there is either increased forward or arterial pressure, or increased backward or venous pressure. The latter is of more importance

DROPWORT — DROWNING

than the former. Some vital alteration in the walls of the capillaries is important in bringing about the phenomena. The treatment of dropsy is technical to a high degree, inasmuch as the causes are frequently obscure. See **HEART DISEASE**.

Drop'wort, a plant belonging to the natural order *Rosaceæ*. It has pinnate leaves with serrated segments, and in habit resembles the meadow-sweet (*Spiræa salicifolia*), from which it may be distinguished by its scentless flowers and its different habitat. It was formerly included in the same genus, but is now assigned to *Porteranthus*, so named after Prof. T. C. Porter. It is known also as bowman's root. The hemlock dropwort, or water dropwort, is *Oxypolis rigidus*, an umbellifer growing in swamps from New York to Florida, and westward to Minnesota, and Louisiana. It is poisonous.

Droseraceæ, drös-ē-rā'sē-ē, the Sundew family, marsh plants, and natives of temperate and warm climates. The family has six genera, and about 125 species, known throughout the world. Among members of the family are *Venus flytrap* (*Dionæa muscipula*) (q.v.), and *Parnassia*. The family is represented in America by the typical genus of the order *Drosera*, which has about 110 species, most abundant in Australia. Seven species of the sundews are found in various parts of North America.

Drosky, drös'kī, **Droshky**, or **Droschky**, a kind of very small, light, four-wheeled carriage used by the Russians. It is not covered, and in the middle there rises a sort of bench placed lengthways. When there is only a single person in the drosky he generally throws one leg on each side of this bench, but the conveyance is also capable of holding two persons. The wheels are covered with wings, which keep off the mud. The term is now applied to several other kinds of vehicles.

Drosom'eter (from the Greek *drosos*, dew, and *metron*, a measure), an instrument for ascertaining the quantity of dew which falls. It consists of a balance, one end of which is furnished with a plate fitted to receive the dew, the other containing a weight protected from it.

Drossinis, drō-sē'nes, **Georg**, Greek poet: b. Athens 21 Dec. 1859. He has published five volumes of lyrics: 'Spiders' Webs' (1880); 'Stalactites' (1881); 'Idylls' (1885); 'Straw Flowers' (1890); 'Amaranths' (1891); also some stories and other minor works in prose. A charming simplicity of language characterizes all his works.

Drouais, Jean Germain, zhōn zhâr-măñ droo-ä, French painter: b. Paris 25 Nov. 1763; d. Rome 13 Feb. 1788. He was a pupil of David and having gone to Rome to study was, in 1784, successful in carrying off the great prize, his subject on that occasion being, 'The Canaanitish Woman at the Feet of Jesus.' His 'Dying Gladiator,' and particularly his 'Marius at Minturnæ,' on being exhibited in Paris, gained for him and David's school a new triumph.

Drouet, Henri, ōn-rē droo-ä, French naturalist: b. Troyes 1829. He early became known by his researches in natural science, and in 1855 published 'Énumération des mollusques terrestres et fluviatiles vivants de la France continentale,' due to his travels examining govern-

ment and private collections throughout France and his personal observations, which were extended in 1857 by a scientific journey through Portugal. He held a government position in the departmental administration from 1858 to 1870. The chief of his further publications are: 'Les mollusques terrestres et fluviatiles de la Guyane française' (1859); 'Sur terre et sur mer' (1870); and 'Alger et le Sahel' (1887).

Drouet, Jean Baptiste, zhōn bāp tēst droo-a, **Comte d'Erlon**, French marshal: b. Rheims 29 July 1765; d. Paris 25 Jan. 1844. His conduct in the Peninsular war was highly distinguished. After the fall of Napoleon he was arrested on the charge of conspiring against the royal family. On the return of Napoleon from Elba he contrived to seize the citadel of Lille, in which he had been imprisoned, and held it for the emperor, who made him a peer of France. At the battle of Waterloo he commanded the 1st corps d'armée. After the capitulation of Paris he fled to Bavaria, where he resided till the July Revolution, when he returned to France, and received in 1832 the command of the army of Vendée. During 1834-5 he held the office of governor-general of Algeria, and in 1843 was elevated to the rank of marshal.

Drouët, Robert, American actor and playwright: b. Clinton, Iowa, 1870. He began his theatrical career at the age of 16, and a few years later headed a company of his own in which he played leading Shakespearean roles. He has been leading man in Chicago and Philadelphia stock companies, and has played leading parts with various prominent actors. The plays he has written are: 'Doris'; 'The White Czar'; 'Montana'; 'To-morrow'; 'An Idyll of Virginia'; 'Fra Diano'; and 'Captain Bob.'

Drouyn de Lhuys, Édouard, ä-doo-är droo-än dē lū-ēs, French statesman: b. Paris 19 Nov. 1805; d. there 1 March 1881. In 1840 he was placed at the head of the commercial department under the minister of foreign affairs, and shortly after was elected deputy for Melun; but he afterward was deprived of his office because of his opposition to the government. Under Louis Napoleon's presidency he became minister of foreign affairs. After the *coup d'état* he became one of the vice-presidents of the Imperial Senate, and again minister of foreign affairs. Being disappointed at the issue of the Vienna conferences in 1855, he resigned his office. In 1863 he was recalled to his old post, resigning again in 1866.

Drown, Thomas Messinger, American scientist: b. Philadelphia 19 March 1842. He was graduated at the University of Pennsylvania in 1862, studying later at Yale, Harvard, and Heidelberg. From 1874 to 1881 he was professor of chemistry at Lafayette College, and from 1885 to 1895 at the Massachusetts Institute of Technology. Since 1895 he has been president of Lehigh University.

Drowning, a form of asphyxia induced by submergence in water or other fluid. As a rule in drowning the body is submerged, but Peterson and Haynes in their recent 'Legal Text-book' relate the case of an epileptic patient who, while walking on a low, sandy beach, fell in a paroxysm with his face down, causing by his spasmodic movements a small excavation of an inch

DROWNING

and a half in depth in the sand beneath his face. This small depression filled with water and he was found dead from asphyxia about an hour or more after the occurrence. Most cases of drowning result from asphyxia, by which is meant the body becomes poisoned from the lack of oxygenation of the blood, since no oxygen can enter the lungs from the fluid, in a form that can be utilized. Heart failure sometimes occurs in drowning. At one time drowning was a legal method of execution and prevailed in England until the early part of the 17th century; it was much practised in other European countries some years later. It is a frequent method of suicide, fully one third of the cases taking this method. Danger from drowning to swimmers depends very largely upon the ability of the swimmer, although this is not a guarantee of safety, since many excellent swimmers have been known to be unable to sustain the fatigue of being long in the water, and sometimes succumb suddenly from muscular cramps or from attacks of syncope. Persons who have respiratory defects, such as asthma or stammering, or who have organic disease of the circulation, are more liable to drown. Drowning occurs more often among men than among women, because of the greater amount of exposure. Extreme coldness of the water seems to be an important factor in augmenting the danger from drowning. Good health, muscular vigor and calmness of mind are of great importance in cases of danger from impending drowning. With reference to the symptoms there is great variability. Some people who have been submerged suddenly, and in water of low temperature, are found dead on almost immediate rescue. Here probably the nervous shock and deficient heart action accounts for the result. In a great many more cases, however, there is spasmodic closure of the glottis from direct irritation of the water as it enters the nose and mouth, and from nervous reflexes due to sudden chilling of the surface. Many of these patients sink to the bottom at once and remain below the surface, unconsciousness occurring in the course of a few seconds. The respiratory movements are few and convulsive and the heart stops. In the greater number of cases, however, asphyxia results from the entrance of water into the lungs; the individual struggles to come to the surface and as soon as the surface is reached attempts are made to fill the lungs by long inspirations. This very frequently draws a small amount of water into the larynx and then involuntary convulsive efforts result. With each convulsive inspiration more water is drawn in and thus pulmonary congestion becomes more and more pronounced. The struggle for life becomes violent and the patient frequently grasps at everything in sight, even tearing handfuls of mud from the bottom of the body of water. During the convulsive seizures the face becomes blue, the eyes bulge, the features become contorted, the pulse rapid and feeble. Ofttimes the bladder and rectum are emptied. After a few minutes, five or six, respiration ceases; four to six minutes more, sometimes longer, the heart continues to beat, gradually failing in strength and rapidity.

Treatment of all cases of drowning should be insistent and prolonged. If there is a great deal of water in the chest, the chances are lessened. Instances have been recorded in which

patients have been submerged 20 or 30 minutes and have recovered, but if the body has been beneath the surface for over 4 or 5 minutes the general chances of resuscitation are slight. If attempts at resuscitation are made,—and they should always be made unless the body has been under water several hours,—the body should be placed face downward, the head and shoulders depressed, so as to favor drainage of water from the lungs, and all efforts should be directed at first toward the restoration of breathing. The application of hartshorn, smelling salts, or snuff to the nostrils, tickling the throat with a feather, dashing cold water and hot water alternately on the chest and face, and vigorous friction of the upper part of the body to create warmth are of value, as also wiping and cleansing the mouth; surrounding the patient with hot bottles; and hot rectal irrigations of salt solution or whiskey. If these preliminary efforts fail, artificial respiration should be resorted to and continued for several hours. The patient should be still kept face downward, a folded coat or other article of dress raising and supporting the chest. The weight of the body on the chest forces the air out, then turning the body well over but gently on one side, then turning it on its face again, repeating these movements about 15 times in a minute, occasionally varying the side, at each turn and relief of the chest pressure, air enters the lungs and excites breathing. This operation should be assisted between each turn of the body, by brisk and uniform pressure between and below each shoulder-blade. At the same time, but without interfering with these operations, the hands and feet should be dried, wet clothing removed, and the body enveloped in warm blankets or reclothed with dry garments. Should these efforts prove unavailing after from two to five minutes, recourse should be had to Dr. Silvester's method, which consists in placing the patient on the back, on a flat surface inclined slightly upward from the feet, the head and shoulders being raised and supported on a small cushion, or folded article of dress placed under the shoulder-blades. The tongue should be drawn forward, and fastened by an elastic band, string, or tape over the tongue and under the chin, to keep it projecting beyond the lips. Then to imitate the movements of breathing and to draw air into the lungs, stand at the patient's head, grasp the arms just above the elbows, and draw the arms steadily upward above the head, keeping them stretched upward for two seconds. To expel the air from the lungs, turn down the arms and press them firmly for two seconds against the sides of the chest. Repeat these movements deliberately and persistently about 15 times a minute, until a natural effort to breathe is perceived, when the efforts should be turned toward inducing circulation and warmth, which can be best promoted by briskly rubbing the limbs upward with flannels, etc., thus propelling the blood along the veins to the heart, and by the application of hot flannels, hot water bottles, heated bricks, etc., to the pit of the stomach, between the thighs, the armpits, and to the soles.

Another method which has the advantage of simplicity and can be applied by one person is that of Dr. Benjamin Howard of New York. The body is placed face downward with a roll of clothing under the stomach, one arm being bent upward so that the hand supports the fore-

DROWSINESS—DRUG TRADE IN AMERICA

head. To expel the water from the chest, the body is pulled feet downward over the roll of clothing. Then turn the body on the back, with the roll of clothing under the shoulders, so that the head falls back, thus stretching the neck. Kneel over the body, one knee pressed firmly against either thigh. With both hands spread over the lower part of the chest, so that the thumb hooks in under the lowest ribs on each side, press forward steadily with the weight of the body on the arms, thus raising the ribs, enlarging the chest cavity, and causing the air to enter. When the ribs have been pushed upward to their utmost extent, release them gently by a receding movement, allowing them to return to their original position, thus expelling the air. Repeat this process until respiration is restored, then resort to the methods already mentioned to induce circulation and warmth. No attempts at resuscitation should be abandoned until all efforts seem to be absolutely futile. See ASPHYXIA.

Drowsiness. See SLEEP.

Droylsden, droilz'dĕn, England, town in Lancashire, just east of Manchester. It contains large cotton manufactories, copperas, chemical, and dye works, and print mills. Pop. (1901) 11,087.

Droz, François Xavier Joseph, frāñ swā ksāv-ĕ-ā zhō-zĕf drō, French moralist and historian: b. Besançon, France, 31 Oct. 1773; d. Paris 5 Nov 1850. In 1806 he published 'An Essay on the Art of Being Happy,' which was very popular; and in 1823 'Moral Philosophy, or Different Systems of the Science of Life,' which procured his admission into the Academy. His reputation is, however, founded chiefly on his 'Histoire du Règne de Louis XVI.'

Droz, Gustave, French novelist: b. Paris 6 June 1832; d. 31 Oct. 1895. He was trained for a painter, but in 1864 gave up the pencil for the pen. The extraordinary success of his first volume of stories, 'Monsieur, Madame, and Baby,' justified the change. He excelled in little sketches of life and manners, and his lively, playful descriptions of bachelorhood and married life captivated the public. He has written: 'Sadnesses and Smiles' (1883); 'A Bunch of Letters'; 'At a Spring'; 'The Child'; etc.

Droz, Henri Louis Jacquet, ðñ-rĭ loo-e zhā-kā, Swiss mechanic: b. La Chaux de Fonds, Switzerland; d. Naples 18 Nov. 1791. He was a son of P. J. Droz (q.v.).

Droz, Pierre-Jacquet, pĕ-ār zhā-kā, Swiss mechanic: b. La Chaux de Fonds, Switzerland, 28 July 1721; d. Bienne, Switzerland, 28 Nov. 1790. Aspiring to be something more than a mere workman, he succeeded in attaching to common time-pieces, at a small expense, machinery which produced music resembling the chime of bells, and the music of a flute. His attempts to discover the means of effecting a perpetual motion led him to important discoveries. He contrived, among other things, a pendulum, which, being composed of two metals of unequal dilatibility, remained unaffected by heat or cold. He afterward made his celebrated writing automaton, which, by means of machinery contained within the figure, was made to move its fingers and hands, and to form handsome letters.

Drug, a name applied to all substances, vegetable, animal, or mineral, used for medicinal purposes, though the term should, perhaps, be strictly confined to what are called simples, balsams, gums, resins, and exotic products used as medicaments in a dry state. The name is also applied to dyeing materials and those used in tanning and other arts. See PHARMACY.

Drug Habits. See CHLORAL; COCAINE; HASHEESH; INTOXICATION; OPIUM.

Drug Trade in America. The development of the American drug trade shows a wonderful growth and a notable process of specialization, for a century ago a large part of the wholesale druggist's stock consisted of glassware, oils, paints, putty, indigo, and madder, whereas now it is confined to true drugs or medicines to an increasingly large degree. America's part in the history of drugs begins, however, before the American drug trade. One of the chief advantages which the world derived from the discovery of America, according to the learned men of that day, was the introduction of new and powerful drugs. For a long time, tobacco, sassafras, and Jesuits' bark were commonly used medicaments. All the old chroniclers dwelt much upon the health-giving qualities of American herbs. Everything that grew here was tried.

Throughout the whole history of medicine and pharmacy may be found a like faith in "patent," or more properly the secret, medicine. Their early pretensions had diminished by the beginning of the American trade, but there was still more natural faith in the community than now, of which the makers of patent medicines availed themselves, and their preparations formed an important item in drug stocks. But aside from patent medicines, which were characteristic of the times and the credulity of the people, the drug business had a much sounder basis for existence and progress. Staples, legitimate drugs, were gathered from all quarters of the globe, and as widely redistributed. The development of American commerce was apparent in this branch of commercial activity. Drugs, such as jalap, ipecac, sarsaparilla, and balsams, imported from Mexico, Central and South America, were exported largely to Europe from New York. In 1820, through French investigation, the separate alkaloids in cinchona bark were determined, and Pelletier shortly after began their manufacture. About the same time John Farr started a quinine factory in Philadelphia, which was followed at a later day by the building of another in New York by John Currie. The first supplies of cinchona bark came through Spain, but when the ports of South America were opened to our commerce shipments were received direct. For a certain period, while the government continued to tax foreign-made quinine, American manufacturers were able to supply the entire home consumption; but with quinine admitted to our free list in 1879, and the lower cost of manufacture abroad, the foreign makers were enabled to ship their surplus stock to this country. They soon secured a foothold in our market, and now supply more than one half the quinine consumed in the United States. Stone-oil or Seneca-oil, now known as petroleum, was first found in West Virginia, where it rose to the surface of the ground, heavy and dark; it was locally popular

DRUG TRADE IN AMERICA

as a liniment. In 1829 a well was drilled in Cumberland County, Ky., which yielded a quantity so large as to be then considered a phenomenon. The bulk of it was wasted, but a little was bottled, and sold in Europe under the name of American oil. The device on the label—a derrick—first suggested a means of securing a sufficient supply of crude oil to pay for refining. From the first it was a medicinal remedy, and later the filtered paraffine residuums have proved valuable, and are known as petrolatum, vaseline, etc. These also have become articles of export, introduced abroad presumably by the demand from our own citizens visiting or residing there.

The earliest mention of the manufacture of drugs in this country is in the instructions given to Sir Francis Wyatt, governor of Virginia, in 1621, to invite attention to the making of oil of walnuts, and to employ apothecaries in its production. The inhabitants were likewise to search for dyes, gums, and drugs. The South Carolina Agricultural Society in 1785 offered premiums for the cultivation of drugs such as senna, cassia, rhubarb, hops, madder, and figs. But it is vain to attempt the description of individual articles and their employment in those olden days; a word or two may be said, however, of the business methods then current. In the retail branch it was largely "go as you please," and in the wholesale line, 60 years ago, the hours of business were from seven in the morning until nine at night. There were no railroads, and after the opening of the Erie Canal there was a rush of trade in the spring, and again before the close of navigation, so that at such seasons clerks would often be at work until midnight. The selling terms were six months, or 5 per cent off for cash. Interest was charged after six months, and sometimes the Southern trade would take an additional six months when the cotton crop failed. But as banking facilities improved credits were shortened. With the outbreak of the Rebellion large amounts outstanding had to be canceled; but though many houses went out of business, comparatively few failures occurred among the wholesale trade. A perusal of the advertisements of wholesale druggists of 100 years ago gives the idea that their stock embraced a great variety of articles. Stocks of the present day are about as varied; but we find that the old articles of *materia medica* have been combined and presented in many new shapes, and these, in connection with the thousands of new articles, present to-day a list whose complexity of nomenclature can be equaled by few lines of trade. The extent of drug stocks of a century ago, compared with those of to-day, might be approximated by a comparison of one of the earlier pharmacopœias with the present edition of 1890. That of 1830 will, perhaps, reflect the condition of affairs for two or three decades previous to its issue. In it 272 articles of *materia medica* are mentioned, and 349 processes are given for preparations, making a total of 621 titles. The 'United States Pharmacopœia' of 1890 has 994 titles, and the 'National Formulary,' a semi-official work of almost equal practical importance, has 435, making a total of 1,429 articles or preparations which the apothecary is supposed to be ready to furnish upon demand.

The wholesale druggist of 50 years ago carried, as do his successors of the present day,

many articles not mentioned in the pharmacopœias of that time, and this feature of the business has so rapidly increased that reference to recent price-lists of prominent jobbing-houses shows an average number of 5,700 articles in the department of drugs, chemicals, oils, etc., and of 7,600 articles in the department of "patent" or proprietary medicines. If the vast number of articles known as "druggists' sundries" were included, the figures quoted might be doubled, and by including the large number of secret proprietary medicines with which the country is flooded, but which are confined to local trade and do not appear upon general price-lists, the figures upon patent medicines would also probably double; so that it seems fair to estimate that the drug trade of to-day handles 25,000 articles. One notable feature of the drug trade of to-day is the division of manufacturing into distinct departments. The retail apothecary a century ago prepared from the crude material the medicines required by the physician. To-day, while his knowledge must include an acquaintance with all processes, his convenience impels him to buy the greater portion of his stock in such a stage of manufacture as renders it ready for dispensing. This has caused the building up of the business of manufacturing pharmacy, developed most extensively during the last 35 years, and the partial development of the manufacture of chemicals.

A review of the drug trade would be incomplete without some data respecting the progress made in chemistry. Apart from the development of inorganic chemistry and especially the discovery of anæsthetics, the evolution of organic chemistry is one of the scientific triumphs of the latter half of the 19th century. The discovery by Wöhler in 1828 that urea could be manufactured artificially from isocyanate of ammonium was the first step in the synthetic production of organic compounds, for until that period chemists held that no organic compound was possible except through the medium of "vital force." Since 1828 innumerable compounds of an organic nature have been prepared synthetically, and many of them are of such importance that they are produced commercially in extensive quantities, as, for instance, alizarine, the chief coloring principle of madder root, of which perhaps \$15,000,000 to \$20,000,000 worth is manufactured annually; oxalic acid, formerly prepared from the juice of the sorrel, is now made at one tenth its former cost from sawdust and caustic soda; while salicylic acid, instead of being derived from oil of wintergreen, is now produced by the action of carbon dioxide upon carbolic acid and caustic soda. The chemist has not only been enabled to prepare many of the organic compounds in his laboratory, but during the past 20 years a vast number of new and interesting synthetic chemicals which plants and animals do not produce (such as antipyrine, exalgine, phenacetine, etc.) have been discovered. This number is continually increasing, and many of the compounds are of importance therapeutically, and of much interest to the druggist and the drug trade. All this progress, this discovery in allied science and labor, has of necessity exerted a powerful influence upon the drug trade, and contributed toward making it what we find it to-day. But other agencies have been equally operative and effective in molding and shaping it.

DRUG TRADE IN AMERICA

Of the first in importance among these agencies in its direct effect upon the retail trade, and through it upon the wholesale branch, has unquestionably been the 'United States Pharmacopœia.' At the beginning of the 19th century drugs were usually handled in a way which would be far from reassuring to the invalid of to-day. Between 1810 and 1820, however, an authoritative agreement was made on the part of those dealing in and prescribing drugs, regarding the identity and purity of the various medicinal agents then in vogue, and in 1820 appeared the 'United States Pharmacopœia,' a work which has passed through successive decennial revisions up to the present time, and which is recognized as the standard in all the various manipulations of drugs and chemicals, from the identification of the crude material to its proper preparation for the use of the invalid. Although this great work is the result of what might be called private initiative or purely scientific devotion, and is essentially the work of a distinct professional class, it has received governmental recognition to such an extent that the statutes of most of the States recognize it as an authority in legally determining the purity of drugs sold; and as a contribution to the literature of applied science it receives the indorsement of the medical and pharmaceutical professions of all countries. Governmental inspection of imported drugs began between 1820 and 1830, largely because of the initiative of the new pharmaceutical colleges in Philadelphia and New York, and it is still carried on by the national government. The next step in the reform of American pharmacy was the additional legislation, which is known popularly as the "Pure Food and Drug Laws." At the present time such legislation is receiving much earnest attention from the press, the public, and the trade, and in keeping with it are the laws of the various States regulating the handling and sale of drugs, chemicals, and poisons at retail. As it becomes more apparent that skill and experience in handling such articles are necessary to the public welfare, this class of legislation receives increased attention. The first law of this sort was passed by Rhode Island in 1870, since which time all the States, with but few exceptions, have taken similar action. There is a lack of uniformity of detail in such laws, but in general they restrict the dealings in drugs and the compounding of prescriptions to those who are able to bring satisfactory evidence of their qualifications before a board of pharmacy, which is authorized to license those whom it deems qualified to engage in the business. The beneficial effect of such legislation is at present only partial; for upon the enactment of these laws, all already engaged in the business were allowed to continue without qualifying under the new conditions. There are still many in the retail trade whose qualifications have not been officially determined. But this is a condition which a few years will serve to set right.

Associations for the conservation and advancement of the material and professional interests of the drug trade have exercised a powerful controlling influence. The first organization was effected in the retail branch when, in 1852, 21 active men formed themselves into the American Pharmaceutical Association. The association holds annual meetings for the discussion of scientific questions, trade and educational matters, and has a membership of nearly 2,000. One

of the features of its work is the annual publication of its proceedings, which contains a review of the scientific progress of pharmacy. Other organized bodies in the retail ranks are the State pharmaceutical associations, the oldest of which is that of New Jersey, founded in 1870. There are at present such State associations throughout the country. In the wholesale drug trade a notable event of the century was the formation, in 1876, by many of the western wholesale firms, of an association named the Western Wholesale Druggists' Association, called into existence by the demand of the times. The Civil War caused expansion, which was followed by collapse and a general unsettling of all trade relations. To hold trade, competition became sharp, and concerns that had been doing a prosperous business found it impossible to make profits. A committee was appointed to try to put into effect what is now known as the "rebate plan." This system was planned and adopted by the proprietors of patent medicines and the wholesale druggists to enable the latter to get a fair profit on patent medicines, which they had formerly been obliged to sell on very close margins. Buyers had to sign a contract that they would maintain established prices, and by so doing were entitled to 10 per cent discount, or rebate, on the wholesale price; but should they sell at cut rates, they would be placed on a "cut-off" list and be debarred from buying from the proprietors. In 1882 many of the eastern druggists joined with those of the West at a meeting in Cleveland, and the name of the association was changed to the National Wholesale Druggists' Association. The following year its first meeting was held in New York. While the various committees have worked hard and reported annually on matters of trade interest, such as the national bankruptcy law, fire-insurance, legislation, credits, etc., the committee on rebates has really effected the most important change in trade matters. Up to that time there had not been more than a dozen large distributing centres in the United States; now, by the working of the rebate system, almost all towns of 50,000 inhabitants have one or more wholesale druggists, who are placed on an equal footing with the largest buyer, and each one supplies the retailers in his neighborhood. Another important factor in the growth of the drug trade in this country is the pharmaceutical press. It presents records of current scientific investigation and progress, and brings the members of the trade or profession into closer touch and sympathy. Prominent on the list are the monthly journals, the 'American Journal of Pharmacy' (Philadelphia), the 'Druggists' Circular and Chemical Gazette' (New York), 'Pharmaceutische Rundschau' (New York), the 'Western Druggist' (Chicago), the 'National Druggist' (St. Louis); and the 'New England Druggist' (Boston). Of semi-monthlies may be mentioned the 'American Druggist and Pharmaceutical Record' (New York), and of weekly publications, the 'Pharmaceutical Era,' the 'Shipping and Commercial List,' and the 'Oil, Paint, and Drug Reporter,' all of New York. In addition there is a considerable number of similar publications issued by various colleges and societies and by several prominent drug and manufacturing firms.

The growth in method has already been hinted at. A century ago the apothecary cut and

DRUG TRADE IN AMERICA

rolled his pills by hand, and made his plasters with a "spreading-iron"; to-day machinery greatly simplifies these operations, and the manufacturing pharmacist by power-machines is enabled to turn out 100,000 pills per day, and plasters *ad libitum*. For making compressed tablets power-machines are used which turn out 500 tablets a minute. Seidlitz powders are mixed, measured, and put up in packages by machinery, and bottles are filled, corked, and labeled by similar means. Marvelous has been the progress in operative, manipulative pharmacy, and the benefit to the drug trade from the results of inventive skill is shown when we consider that the combined rating of 270 wholesale druggists and manufacturers of chemicals and pharmaceuticals is nearly \$50,000,000. Of these, 11 are rated at \$1,000,000 each; about 30 up to \$500,000 each; 37 at \$250,000 each; and the others from \$20,000 to \$25,000 each. There are eight large factories engaged in manufacturing fine chemicals, and over a dozen firms making pills and other pharmaceutical preparations on an extensive scale. Let us enumerate a few of the most noteworthy improvements: Fluid extracts, as constituting a class of pharmaceutical preparations, are essentially an American invention. They are made by percolation or displacement, a process in which the powdered drug in a suitable vessel is deprived of its soluble constituents by the descent of a solvent through it. The value of this process cannot be overestimated, as the progress made in pharmacy in America during the last half-century is largely due to the study and development of percolation, and the introduction of preparations which are the direct outgrowth of the process. Percolation was made official in the 'Pharmacopœia' of 1840, and has been continued in the various revisions of that work to the present time. None of the pharmacopœias preceding that of 1850 gives formulas for the preparation of fluid extracts; in that year only seven formulas were given; in 1860 the number was increased to 25, and in the edition of 1890 there are 88. This number does not at all represent the great variety of fluid extracts manufactured, for they have become almost as numerous as the vegetable drugs in popular use. Another innovation is the elixirs, which are aromatic, sweetened, spirituous preparations containing small quantities of active medicinal substances. The term "elixir," used by manufacturers as designating a class of pharmaceutical preparations, was introduced prior to 1840, but the first formula published under the name "elixir" for the use of the druggist did not appear until 1859. In the adaptation of labor-saving machinery to the manufacture of pharmaceutical preparations the American inventor has found a field worthy of his genius, and of the greatest importance to the pharmacist. A century ago the old-fashioned iron or stone mortar for powdering drugs was to be found in every pharmacy, and drug-milling was unknown. Iron and stone mills have been superseded by new machinery which has greatly improved the quality of the product and cheapened the cost of production. Among the most important innovations is the process of grinding by attrition. Rapidly revolving arms in a cylinder soon reduce the introduced substance to any degree of fineness desired. For substances more friable, the rumbler, a revolving cylinder inside of which are porcelain balls, works better, and it

requires very little attention. Centrifugals have also brought about great changes in chemical production, and percolators have displaced the wide-mouthed jar and stirring-stick.

Sugar-coated pills were first made in this country by the Tilden Company, of New Lebanon, N. Y. The popularizing of gelatine capsules as a means of administering nauseous remedies in a readily assimilable condition is largely due to American push and inventive genius. The process originally outlined for their manufacture was that of Mothes, of Paris. H. Planten & Son claim to have been the first to make and introduce them in the United States. In the early seventies the invention of improved machinery for their manufacture gave the industry a strong impetus, and the business became one of magnitude. Pure fruit-juices have become a very important article to the retail drug trade. For making "soda-water," fruit flavors from artificial essences were for a long time used, until more cultivated tastes required the natural flavors. The manufacture of these is now carried on on a large scale, and great quantities of fruits are thus utilized.

In special fields of manufacturing pharmacy the development of new ideas and processes has been equally prominent. Perhaps one of the most interesting of these special developments has been that characterizing the discovery, commercial exploitation, and rapidly increasing commerce in what are known as the digestive ferments, of which pepsin is the best known. In keeping with the crude speculative views of the ancients on all physiological phenomena, the most absurd theories were advanced to explain the process of digestion in the stomach. It was not until the first quarter of the 19th century had nearly elapsed that the correct conception of the nature and agencies of the digestive secretions and process was reached. In America the commercial importance of pepsin and the other digestive ferments is far greater than in any other country, and in America their value and practical usefulness as therapeutic agents and in the artificial digestion of foods have been most fully developed. It was an American surgeon, Beaumont, who made (1825-33) the famous classical observations upon the phenomena of digestion in the living stomach, which revealed the functions of the gastric juice and did much to stimulate and suggest the direction of subsequent inquiries. The active principle of the gastric juice was discovered by Schwann, 1836, and he gave it the name of pepsin; diastase was discovered by Payen and Persoz, 1833; the album-digesting ferment of the pancreas was described by Corvisart, 1857-8, but not accepted until confirmed by Kühne (1867), who separated the ferment and named it trypsin; the emulsive ferment was discovered by Eberle in 1834. The history of American commerce in pepsin practically begins with the introduction of Scheffer's pepsin in 1872. This was prepared by the simple and practical "salt" process, a great improvement over previous methods of obtaining the ferment from the stomach. In 1879 Fairchild introduced the original form of pepsin in scales, "free from added substance or reagents." The appearance of this pepsin of phenomenal strength, with the recognition of the fallacy of administering the ferment in the largely diluted form then in vogue, was the signal for great activity in the manufacture and improvement of

DRUG TRADE IN AMERICA

commercial pepsins. The obvious importance of stomach digestion naturally directed attention chiefly to the stomach ferments, and the medicinal use of the digestive ferments still remains popularly identified with pepsin; yet the other digestive ferments, especially those of the pancreas, possess far wider scope of activity and are relatively of wider importance. Practical recognition and application of these pancreas ferments must fairly be attributed to Fairchild, who in 1880 introduced the *extractum pancreaticis*, containing diastase for the conversion of starch, trypsin for the conversion of albumin, the emulsifying ferment for the digestion of fats, and the milk-curdling ferment. Fairchild demonstrated the very remarkable practical value and adaptability of these pancreas ferments, especially in the artificial digestion of foods for the sick. In the preparation of infant foods both diastase and trypsin have been extensively employed. Because of the indigestibility of starch for infants, Liebig proposed that the farinaceous foods commonly used with milk as food for infants should first be predigested into soluble form by means of malt diastase. In 1884 Fairchild proposed a method of modifying and adjusting cows' milk to a resemblance of human milk in digestibility and composition. Fairchild's method is based upon the conversion of caseine, by means of trypsin, into the soluble and peptone-like bodies which give to human milk its peculiar digestibility, in contrast with cows' milk. Pepsin now appears in a great number of popular as well as official forms, and is prepared generally by pharmaceutical manufacturers everywhere. The only house in the world engaged, as an exclusive specialty, in the manufacture of the digestive ferments and predigested foods is in the United States. The digestive ferments occupy a brilliant position in modern therapeutics, and the progress of physiological chemistry suggests still further utilization of the animal organic principles, as recently shown in the successful and important treatment of disease by the thyroid gland.

The india-rubber porous plaster, which was the first improvement made on old methods of applying plaster masses to the human body, was invented by Dr. Shecut, a naval surgeon, who sold it to Thomas Allcock, who failed to make it a success, and sold out to Dr. Brandreth. There were a number of manufacturers of plasters doing business at that time, whose products were made chiefly of isinglass and resinous mixtures, the latter being spread on cloth and plaster skins. About 1867 Seabury & Porter commenced to experiment with rubber, in order to introduce a general line of improvements. In those days, and up to 1876 or 1877, many of the mixtures were in solution, and the plaster mass was spread on frames with a brush, then cut, and made porous. Seabury was the first who conceived and practically worked out the idea of the use of rubber in medicinal and surgical plasters.

Another distinctively American form of medication unknown to our forefathers was introduced in 1878 in New York by Dr. R. M. Fuller, under the name of "tablet triturates." These preparations are made by triturating the active ingredient with either plain sugar of milk or a mixture of sugar and milk and cane-sugar, forming the mixed powders into a paste and pressing the paste into tablets in appropriate molds. In

this way small quantities of potent remedies, such as alkaloids, concentrations, etc., could be administered in a convenient, palatable, and readily soluble form. The idea was a taking one with the medical profession, and manufacturers began to produce them upon an enormous scale. An idea of the magnitude of this work may be gleaned from the statement that a single manufacturer lists no less than 500 different varieties of these preparations.

These instances of development in individual lines prepare one for a presentment of statistics showing the magnitude of the commerce in which the drug trade is to-day engaged. One of the advantages secured by the organized trade bodies that have come into existence during the past 50 years has been the keeping of statistics and the recording of current history. If such organizations had existed a hundred years ago the work of the present compiler would be comparatively simple. Our government did not keep records of imports and exports of drugs prior to 1830, and even then the list comprised but few items. The exports of medicinal drugs from the United States were then stated as \$130,238. For the year ending 30 Sept. 1835, they were reported at about \$200,000, whereas 60 years afterward the exportations of medicines of all kinds amounted to about \$8,000,000. Of these, ginseng root alone amounted to 233,236 pounds, valued at \$826,713, all of which was exported to China. Our own continent and the West Indies have been the only fields for exports as far as the introduction of our manufactured articles is concerned. Except for a few specialties, Europe has taken our simples only. Probably tobacco was the earliest indigenous drug exported, and its consumption has so increased that it is now of sufficient importance to be classed by itself. Oil of peppermint, which we find quoted in 1804 at 50 cents per pound, for the past few years has been selling at from \$1.50 to \$3 per pound. It was first cultivated in New York State about 85 years ago, and has also been very successful in Michigan. A sudden drop of price about five years ago has restricted production, the crop of 1897, 251,000 pounds, being the largest ever reported. A very fair proportion of the crop, something like 100,000 pounds, being the maximum for a year, is exported.

Senega or snakeroot has become a popular drug. It was formerly found in the eastern States, but is now found in sufficient quantities to pay for digging only in Minnesota, Dakota, and Manitoba, except some small quantities that come from the South. This root was quoted at 25 cents 100 years ago. It went up to 60 cents but during the last five years has declined, until now it is at the old figure. The annual production is estimated at between 300,000 and 400,000 pounds, and about one third the amount now gathered goes abroad to meet the increasing foreign demand. *Serpentaria*, or Virginia snakeroot, as it is sometimes called, comes mainly from Texas. This was quoted in 1804 at 25 cents, and this is still very near the average price. A demand exists for it for export, as also for goldenseal, sassafras, and mandrake roots, damiana and lobelia herb, and slippery-elm bark; but of all the indigenous drugs exported, cascara-sagrada bark probably is the largest in quantity, although ginseng root doubtless leads in value. Borax, although not an

DRUGGET—DRUID

article of export, has considerable importance as a home product. Formerly our supply came from England or indirectly from Italy. It was first discovered in California in 1856, and later in the deserts of Nevada; now these two States supply the country. Before 1872 borax sold at from 28 to 35 cents per pound; since then the increased production has brought the price down to between 5 and 8 cents per pound.

Although we are still large importers of drugs and chemicals, the reason for this is a purely economic one, or rather it is a matter of convenience. The natural resources of the United States will, when developed, furnish nearly everything in the way of medicines. Borax has been cited as an example, but there are many others, especially those materials which enter into the inorganic compounds, and which are easily accessible, such as quicksilver, iron, lead, copper, zinc, aluminum, sulphur, lime, potash, soda, gold, silver, manganese, etc. With a climate ranging from frigid to torrid, nearly all the medicinal products of the vegetable world could with proper care be propagated in this country. Experiments with camphor, cork, licorice, opium, olives, and other foreign plants have demonstrated this fact.

We have no data as to the number of druggists doing business in the United States 100 years ago; but though there are now 38,000 in the country, the New York directory of 1786 gives the names of only five. Effingham Lawrence was the druggist and apothecary to the Medical Society, a committee of which examined his store quarterly and certified that his drugs were genuine and his medicines faithfully prepared. Two wholesale drug houses of the present day were founded about a century ago, but only one continues under the original name, though quite a number date back 60 or 70 years. The principal houses of that day were Lawrence & Keese, J. A. & W. B. Post, Thomas S. Clark, John & William Penfold, John M. Bradhurst, R. & S. Murray, Silas Carle, John C. Morrison, and Olcott & McKesson. The firm of Schieffelin & Company, of New York, is the oldest house in the drug line continuing under the same name in this country. It was founded by Jacob Schieffelin in 1794, and has been continued by his descendants. The firm of Powers & Weightman, of Philadelphia, was established in 1818 as Farr & Kunzi.

The first drug store in Washington was opened in 1796 by Frederick Miller, but its location cannot now be identified. Of the firms who have been 50 years or more in business in that city there are now but four. The store of Z. D. Gilman was established in 1822 by Seth Todd, who was succeeded in 1842 by Z. D. Gilman, since whose death a few years ago the business has been conducted in his name for the widow. The present firm of Sheller & Stevens was established in 1828 by William Gunton, and through a series of successions is maintained now under the name just quoted. Whiteside & Walton's store was established early in the thirties, as was also Thomas L. Crockley's business, whose founder was George W. Sothoron. Probably the oldest drug house in the West is that of T. H. Hinchman & Sons, of Detroit, Mich. The earliest Chicago wholesale druggists of whom we have any record are the following, named in the order of establishment: Dr. Clark; Dr. Brinkenhoff, now Peter Van Schaack & Sons; Dr.

John Sears; Stebbins & Reed, afterward J. H. Reed & Company; F. Scammon & Company; and Fuller & Roberts, now the Fuller & Fuller Company. Among the many firms manufacturing medicinal chemicals worthy of mention are: Rosengarten & Son, Philadelphia; Charles Cooper & Company, New York; Charles Pfizer & Company, New York; Mallinckrodt Chemical Works, St. Louis; Larkin & Scheffer, St. Louis; Herf & Frerichs Chemical Company, St. Louis. One of the most recently established of the chemical manufacturing concerns is the New York Quinine and Chemical Works, Limited. Although this corporation was formed in 1886 only, the quality of its products has placed it in the front rank. It was the first in this country to make, on an extensive scale, caffeine, cocaine, aloin, and acetanilide, and is the second largest American producer of quinine and morphine.

The United States can boast of many extensive laboratories devoted to the manufacture of pharmaceutical preparations. A pioneer in this line was Dr. E. R. Squibb, who in 1854, as a passed assistant surgeon in the United States navy, organized and ran the United States Naval Laboratory, furnishing the medical supplies for the navy for three years. In 1858 he started the present manufacturing business. Other houses are the Tilden Company, Lebanon, N. Y. (one of the first); Billings, Clapp & Company, and the E. L. Patch Company, Boston; Sharp & Dohme, and the Burroughs Brothers Manufacturing Company, Baltimore; Henry Thayer & Company, Cambridgeport, Mass.; William R. Warner & Company, John Wyeth & Brother, and H. K. Mulford Company, Philadelphia; Parke, Davis & Company, and Frederick Stearns & Company, Detroit, Mich.; William S. Merrell Chemical Company, Cincinnati, Ohio; Eli Lilly & Company, Indianapolis, Ind.; Charles S. Baker & Company, and the Searle & Hereth Company, Chicago. Henry Troemner, of Philadelphia, was, as near as can be ascertained, the pioneer manufacturer of druggists' balances or fine scales. He came here in 1836 from Marburg, Germany, and started in business in Philadelphia two years later. At that time scales for druggists were made to order by jewelers, and were generally of hammered silver, and consequently very expensive. In New York the number of jobbing druggists has decreased, and much of the importing is now done through foreign agencies. Likewise all the leading manufacturers throughout the country have agencies in this city, which condition tends to divide up the jobbing business; but there is a population of 4,000,000 in its immediate neighborhood to be supplied, in addition to its still being the largest distributing centre for the whole country.

JOHN MCKESSON,
McKesson & Robbins, New York.

Drug'get, a coarse and flimsy texture originally half silk and half wool, chiefly used for covering carpets. It was formerly extensively employed as an article of clothing by the poorer classes, more especially of females; but this and similar fabrics are now almost wholly superseded by cotton goods, which induce greater cleanliness, and are less liable to retain infectious and contagious poisons.

Druid, a member of the Celtic priesthood of ancient Britain and Gaul, which at the period of the Roman invasion, existed chiefly

DRUID STONES — DRUM

in Brittany, and along the valley of the Loire; and in the island of Anglesey, in Wales, and in Ireland. Scattered throughout these regions, at Carnac in Brittany, at Stonehenge and Avebury in England, and numerous other localities, are the stupendous stone structures, known as cromlechs, menhirs, dolmens, kistvans, etc., ascribed by the older archaeologists to the druidical cult, and still popularly known as druidical temples and altars, but now assigned by scientists to prehistoric palæolithic and neolithic predecessors, although it is probable these megalithic monuments were used by the Druids in their mystic rites to impress the populace. Welsh tradition relates that the Druids entered Gaul from the Orient with the Celtic Kymric race, and their religious practices have been variously described as of Hindu, Persian, and Egyptian origin. Accurate knowledge of the sect is limited owing to their inviolable practice of not allowing their history to be written, all their lore being committed to memory, and all instruction being imparted orally. The best ancient and contemporary account of the Druids is that by Julius Cæsar, who thus describes them: "They attend to divine worship, perform public and private sacrifices, and expound matters of religion. A great number of youths are gathered round them for the sake of education, and they enjoy the highest honor in that nation; for nearly all public and private quarrels come under their jurisdiction; and when any crime has been committed, when a murder has been perpetrated, when a controversy arises about a legacy or about landmarks, they are the judges, too. They fix rewards and punishments; and should any one, whether a private individual or a public man, disobey their decrees, then they exclude him from the sacrifices. This is with them the severest punishment. The persons who are thus laid under interdict are regarded as impious and wicked people; everybody recoils from them, and shuns their society and conversation, lest he should be injured by associating with them. They cannot obtain legal redress when they ask for it, nor are they admitted to any honorable office. All these Druids have one chief, who enjoys the highest authority among them. When he dies, he is succeeded by the member of the order who is most prominent among the others, if there be any such single individual; if, however, there are several men equally distinguished, the successor is elected by the Druids. Sometimes they even go to war about this supremacy. At a certain time of the year, the Druids assemble on the territory of the Carnutes, which is believed to be the centre of all Gaul, in a sacred place. To that spot are gathered from everywhere all persons that have quarrels, and they abide by their judgments and decrees. It is believed that this institution was founded in Britannia, and thence transplanted into Gaul. Even nowadays, those who wish to become more intimately acquainted with the institution generally go to Britannia for instruction's sake.

"The Druids take no part in warfare; nor do they pay taxes like the rest of the people; they are exempt from military service, and from all public burdens. Attracted by such rewards, many come to be instructed by their own choice, while others are sent by their parents. They are reported to learn in the school a great number of verses, so that some remain there 20

years. They think it is an unhallowed thing to commit their lore to writing, though in the other public and private affairs of life they frequently make use of the Greek alphabet. . . . Beyond all things, they are desirous to inspire a belief that men's souls do not perish, but transmigrate after death from one individual to another; and they hold that people are thereby most strongly urged to bravery, as the fear of death is thus destroyed."

Besides being priests and teachers of religion the Druids appear also to have been adept astrologers and magicians, and were versed in the mysterious powers of animals and plants; the oak-tree, the mistletoe when growing on the oak, the vervain, the hyssop, and marshwort were held in especial reverence among them, and like the Romans, they drew auguries and prophecies from an inspection of the entrails of sacrificed animals, and from the flight of birds; their mysterious rites were usually performed in the depths of oak forests. The order was divided into three classes: vates or prophets, bards, and priests; with them were associated, but without sharing their prerogatives, three classes of prophetesses or sorceresses.

Before the advent of the Romans the autocratic powers of the priesthood aroused the antagonism of the warrior element of the tribes, and according to Cæsar, the latter had deprived them of much of their political power. The Druids exerted all their powers to oppose the Roman conquerors, and continually incited the people to rebellion, until they were driven out of Brittany into Wales, and finally gathered in the island of Anglesey, where they were attacked by Suetonius Paulinus in 61 A.D., and in 78 A.D. were utterly subdued and almost exterminated by Agricola.

Druid Stones, a name given in England and other parts of the country to weather-worn, rough pillars of gray sandstone which are scattered over the surface of the chalk-downs in England, in Scotland, and its islands, and which exist in great numbers in other countries; generally in the form of circles, or in detached pillars; it is not certain, however, that the Druids had any connection with these stones. See GRAYWETHER.

Druids, United Ancient Order of, a secret society springing from a club organized in London 1871, solely for the entertainments of its members. The popularity of the club soon led to the formation of a distinct order and provided with a ritual for initiations and a form of government founded on traditions said to have been preserved from the ancient Druids. There are now two independent bodies, the Ancient Order of Druids and the Order of Druids of England. The order was instituted in New York in 1833. In 1900 the order in the United States reported 16 grand groves, 395 subordinate groves, 16,782 members, and \$4,536,701 disbursed in benefits since 1847; benefits disbursed during last fiscal year \$214,034.

Drum, a musical instrument formed by stretching parchment animal skin over the heads of a cylinder of wood or over a bowl-shaped metallic vessel. There are three kinds of drums: (1) The long drum or bass drum with two heads, held laterally and played on both ends with stuffed-knob drumsticks; (2) the side-drum, having two heads, the upper one

DRUM — DRUMMOND

only being played on by two sticks of wood; the lower head has occasionally strings of catgut stretched across its surface, and then it is called a snare drum; (3) the kettle-drum always employed in pairs. Of these (1) is the ordinary drum used by an infantry or marching band. It is employed mainly to mark the time, and also to increase the fortes. The big drum, or *grosse caisse*, of the modern orchestra, is a modification of the ordinary drum, with the diameter greatly increased, and the length of the cylinder lessened. It is struck on one side only. (2) Is the side-drum of the fife and drum bands. It is occasionally employed in the orchestra for special effects. (3) Are either the small kettle-drums of the cavalry band, played on horse-back; or the proper orchestral drums, larger in size, but similar in construction. They are generally tuned to the tonic and dominant of the composition in which they are used, but this rule is not without exceptions. The tambourine is a species of drum, consisting of a single skin on a frame or vessel open at bottom. The heads are tightened by cords and braces, or by rods and screws.

The drum was a martial instrument among the ancient Egyptians, as the sculptures of Thebes testify. Their long drum was like the Indian tam-tam, and was beaten by the hand. It was about 18 inches long, had a case of wood or metal, and heads of prepared skin, resembling parchment. These were braced by cords in a manner somewhat similar to the modern. The instrument was carried by a belt, and was slung behind the back on a march. The invention of the drum is ascribed to Bacchus, who, according to Polygæus, gave his signal of battle by cymbal and drum. It was, however, known in very early ages, and in some form or other among almost all nations.

Drum, a Celtic word common in Ireland and Scotland, signifying a knoll, ridge, or small hill, frequently found alone as the name of a village, farm, estate, etc., and often also as a prefix, as in Drumalbin, Drumderg, Drumlanrig, Drummoissie, etc. Irish geologists give the name to all elevations.

Drumclog, Scotland, a place in Lanarkshire, on the borders of Ayrshire, 16 miles southeast of Glasgow. In 1675 Drumclog was the scene of a battle in which the Covenanters defeated the Royalists. The battle is described in Scott's 'Old Mortality.' A monument marks the scene of the encounter.

Drumfish, or **Drum**, certain fishes of the family *Sciaenidae* (q.v.), so-called from the resonant sound which they produce in the water by forcing gas through the air-bladder. In the United States the name is especially applied to the following. The common drumfish (*Pogonias chromis*) which has a short stout body, numerous barbels on the lower jaw, and large pavement-like teeth on the pharyngeal bones. It is one of the largest of food fishes, though the flesh is not highly valued. The drumfish is common on sandy shores south of Long Island and is caught on lines thrown into the surf. By means of its powerful dentition the shells of the stoutest mollusks and crustaceans are crushed and their contents devoured. At times schools of drumfish create great havoc on oyster beds. The red drum or red-fish (*Sciaenops ocellatus*) is a smaller fish, weighing from 10 to 75 pounds,

and distinguished by the separate lower pharyngeal bones, the absence of mandibular barbels, and the eye-like spot at the base of the tail. It is one of the most important game and food fishes of the southern United States, especially in Texas. The black drum (*Sciaenidae deliciosa*) is a closely allied dusky bluish species found in the warmer parts of the Pacific coasts of America. The fresh-water drum or sheepshead (*Aplodinotus grunniens*) is closely related to the common marine drumfish, from which it differs in the absence of barbels. It ranges from the Great Lakes, where its flesh is coarse and rank and of little value for food, to Texas, where it becomes a fine-flavored and important food fish. It sometimes exceeds 50 pounds in weight.

Drumgoole, John Christopher, American clergyman: b. Longford County, Ireland, 1828; d. New York, 28 March 1888. He was ordained a Roman Catholic priest in the United States, and in 1871 began an organized mission in New York for homeless boys. The work grew under his charge and he built in New York a home called the "Mission of the Immaculate Virgin," and established an industrial farm of over 600 acres on Long Island, all in the interest of homeless boys.

Drumlin, a smoothly rounded oval hill of boulder clay, or till, formed beneath the great ice sheets of the glacial period. Drumlins are most frequently found near what was the front of the ice sheet, and, by their peculiar form, are easily recognized. They are usually over half a mile long and from 100 to 200 feet high. Drumlins are of common occurrence in Massachusetts, particularly about Boston harbor, where some form islands. They are also abundant in western New York and in southern Wisconsin. Their method of formation is uncertain, though they plainly represent material gathered beneath the ice sheet and in some way piled up by it. See **DRIFT**; **GLACIAL PERIOD**.

Drummer, one of the members of a regiment whose office it is to beat the drum, to mark time for military exercises and marching. In all the branches of the army service he receives slightly more pay than a common soldier. The drummers of a regiment are under the control of the sergeant-drummer. Also, in the United States, the name is applied to a traveling salesman or one who solicits trade going from one town to another.

Drummond, Sir George Gordon, English soldier: b. 1771; d. 1854. He entered the British army as ensign in 1789; was staff-officer at Jamaica several years; on duty in Canada 1808-11, and promoted lieutenant-general 1811. He was again ordered to Canada as second in command under Sir George Prevost 1813; planned and effected the capture of Fort Niagara; planned the successful attack on Black Rock and Buffalo; led a combined military and naval force against Oswego and destroyed the American works and stores, May 1814. He was in command of the British forces at the battle of Lundy's Lane 25 July, and in August invested, but failed to capture, Fort Erie. In 1815 he was appointed governor-general of Canada.

Drummond, Henry, Scottish geologist and religious writer: b. near Stirling 17 Aug. 1851; d. Tunbridge Wells 11 March 1897. He was educated at the universities of Edinburgh

DRUMMOND — DRUNKENNESS

and Tübingen; entered the ministry of the Free Church, and having devoted much attention to science, was in 1877 appointed lecturer on natural science in the Free Church College, Glasgow, being made professor in 1884. One of his most popular books was 'Tropical Africa' (1888), giving his own experiences in that part of the world. His most remarkable work, and the one by which his name became most widely known, is 'Natural Law in the Spiritual World' (1883), which has passed through many editions and been translated into various languages. This work was written with the object of showing that such scientific doctrines and theories as those associated with the name of Darwin and his followers were not incompatible with revealed religion. He was author also of 'Travel Sketches in Our New Protectorate' (1890); 'Pax Vobiscum' (1890); 'The Programme of Christianity' (1892); 'The Greatest Thing in the World'; 'The Ascent of Man' (1894). The last-named work is a semi-popular review of evolution theories which caused some controversy on its first appearance, mainly on account of its author's insistence on the recognition of altruism, or "the struggle for the life of others," as the most important factor in organic and especially in social evolution. His facile and fervid style of composition suited the tastes of large numbers of readers. See 'Life' by G. A. Smith (1898).

Drummond, James, English Unitarian theologian: b. Dublin, Ireland, 14 May 1853. He was educated at Trinity College, Dublin, entered the Unitarian ministry and was colleague of Rev. William Gaskell (q.v.) at Cross St. Chapel, Manchester, 1859-69. He became professor of theology at Manchester New College in 1869, succeeding Rev. James Martineau (q.v.) as its principal in 1885, and removing with the college to Oxford in 1889. He has published 'Spiritual Religion: Sermons on Christian Life and Faith' (1870); 'The Jewish Messiah: a Critical History of the Messianic Idea Among the Jews' (1877); 'Introduction to the Study of Theology' (1884); 'Philo-Judæus: or the Jewish-Alexandrian Philosophy in its Development and Completion' (1888); 'Via, Veritas, Vita' (1894); 'The Pauline Benediction' (1897); 'International Hand-books to the New Testament' (ed. by Orello Cone); 'The Epistles of Paul the Apostle to the Thessalonians' (1899); 'Life and Letters of Dr. Martineau' (with Upton) (1902).

Drummond, Thomas, Scottish inventor: b. Edinburgh October 1797; d. Dublin 15 April 1840. He went to Woolwich to receive special instruction in the duties of an engineer, and while pursuing his studies showed his inventive talent by devising a form of pontoon which recommended itself by its facility of transport as well as by its admirable adaptation to the immediate purpose for which it was intended. Having heard the incandescence of lime mentioned in a lecture, it struck him that the light produced by this incandescence might be advantageously applied to replace the Argand-lamps which were used in the surveys, and after devoting a good deal of attention to the subject, he found a means of effecting the desired object. (See CALCIUM LIGHT.) On the first occasion on which the light was employed, in the Irish survey, it showed the position of a station 66

miles distant. While on the same survey he invented a heliostat which has always been employed since in land-surveying, and with the aid of which observations can be taken at distances exceeding 100 miles. In 1835 he was appointed under secretary for Ireland, and in 1836 was chairman of a commission on railways in Ireland, and gave in a very valuable report of the proceedings of the commission. His services to Ireland were recognized by the erection of a statue by public subscription.

Drummond, William, of Hawthornden, Scottish poet: b. Hawthornden House, near Edinburgh, 13 Dec. 1585; d. there 4 Dec. 1649. He was educated at the University of Edinburgh and, retiring to his romantic seat of Hawthornden, gave himself up to the cultivation of poetry and polite literature. A dangerous illness fostered a serious and devout turn of mind, which was evinced by his first productions, 'The Cypress Grove,' in prose, containing reflections upon death; and 'Flowers of Sion, or Spiritual Poems.' He entertained Ben Jonson at Hawthornden for three weeks on the occasion of a visit which the English dramatist made to Scotland in the winter of 1618-19. To this visit a great deal of interest is attached from the fact that Drummond took notes of the conversations held with Ben Jonson, which were afterward published, though not till long after the death of both. They first appeared in the folio edition of Drummond's works in 1711. These notes were republished separately by the Shakespeare Society in 1842. As a historian, Drummond is chiefly remarkable for an ornate style, and a strong attachment to the High Church principles of the Jacobites. His 'History of the Reigns of the Five Jameses' was published several years after his death. He is now remembered only as a poet. Although tinged with the conceits of the Italian school, there is much genuine imagery and truth of feeling in all his poetry, but particularly in his sonnets, which are replete with tenderness and delicacy. See his 'Poems,' edited with memoir, by Ward (1894); 'Life,' by Masson (1873).

Drummond Island, the extreme west of the Manitoulin chain, in Lake Huron, belongs to Chippewa County, Mich. It measures 20 by 10 miles.

Drummond Light. See CALCIUM LIGHT.

Drunkenness, in law, is not considered an absolute defense, although in some cases, depending on the nature of the act, and to what extent the person was under the influence of intoxicating drinks, the offense, when committed by a drunken man, is changed to one of less severity. The general rule is, that if a person voluntarily, by the use of intoxicating liquors, deprives himself of his reason, he cannot offer it as a defense for acts which he commits while intoxicated. If the intoxication is carried to such an extent as to be a disease, such as delirium tremens, or *mania à potu*, a different question is raised, and, in the first case, it will reduce the offense and in the second case there are some decisions which go so far as to hold that it is a complete defense.

The general rule is that contracts made by a person under the influence of liquor are voidable and not void; so that if a person while intoxicated makes a contract under which some inno-

DRUPE — DRUSES

cent third person, for value, acquires rights, the contract is binding on the person making it; although he was under the influence of liquor at that time. If a person makes a contract when so far under the influence of liquor as to be deprived of his senses, and the contract is so one-sided as to be unreasonable, the question of fraud may enter into the transaction. In cases where a person is tried for murder in the first degree, to prove that crime the evidence must show, according to the statute defining murder in the first degree, malice aforethought. Now it has been held that an excessive intoxication excludes the malice and only passion is shown and the crime is reduced below murder in the first degree. But the person accused must prove intoxication to such an extent that passion and not malice will be shown. Although if a person, while sober, makes all preparation to take a person's life, and then, before committing the crime, becomes intoxicated, doing an act when intoxicated which he was afraid to do when sober, it would be murder in the first degree. In cases of robbery, it is presumed the goods are taken with a felonious intent, but if the accused can prove sufficient intoxication, the felonious taking is not presumed. When a person is tried for an act and the defense is provocation, the amount of provocation to make a good defense would be less, when the person who gave the provocation was intoxicated than if he was sober and in his right senses.

Drupe, in botany, a simple, succulent stone-fruit composed of a single monospermous carpel, of which the carpellary leaf becomes fleshy at its external division, and ligneous in its internal division, as in the peach, cherry, plum, olive, etc. The stone which encloses the kernel is the endocarp; the pulpy, or succulent part, the mesocarp. In the horse-chestnut and cocconut, the mesocarp is not succulent, and in the date the endocarp is replaced by a membrane.

Drury, Arthur, English sculptor: b. London. His art education was obtained at the National Art Training School, South Kensington, and in Paris under Dalou. His principal works are 'The Triumph of Silenus' (1885); 'Circe' (1893); 'St. Agnes' (1894); 'The Age of Innocence' (1897).

Drury, Dru, English silversmith: b. 4 Feb. 1725; d. 15 Dec. 1803. He was devoted to the study of entomology and to collecting exotic insects, and published 'Illustrations of Natural History' (1770-82), with upwards of 240 figures of exotic insects. His 'Illustrations of Exotic Entomology' was edited in 1837 by Westwood, and appeared with nearly 700 figures by Moses Harris.

Drury College, a coeducational institution in Springfield, Mo.; founded in 1873 under the auspices of the Congregational Church. In 1902 the college had 20 professors and instructors, and nearly 350 students. The library contained about 30,000 volumes.

Drury Lane Theatre, a famous place of amusement in London, located in Russell Street, near Drury Lane. It was first opened in 1663, and was rebuilt by Sir Christopher Wren and reopened in 1674. It was again rebuilt in 1794. The present edifice was opened in 1812, with a prologue by Lord Byron, the advertisement for

which gave rise to the famous 'Rejected Addresses.' Garrick opened the theatre in 1747 with Dr. Johnson's prologue; and most of the great English actors have trod the boards which are now given over for the most part to pantomimes and spectacular pieces.

Druses, a people of Syria, scattered over an extensive tract of country lying to the south-east of Beirut, and south of the country occupied by the Maronites; or, more particularly, they occupy the southern parts of Lebanon and Anti-Lebanon (the slopes of Hermon), while considerable numbers also inhabit the Hauran (south of Damascus), where the mountainous tract occupied by them is now often designated the Druse Mountain. The total Druse population is estimated at from 75,000 to 85,000. In the northern districts occupied by them they are mingled with the Maronites, but many towns and villages are peopled almost exclusively by the Druses. There are some circumstances which tend to show that the Druses are not indigenous to the territory they now possess, although they have long since dropped their own language and adopted the Arabic. They were in Lebanon and Anti-Lebanon as early as the 11th century. The peculiar interest attaching to this people belongs, however, more to their political constitution and their religion than to their origin. Politically the Druses are divided into two parties, that called the Jumlatiehs, with the family of Jumblat at their head; and the Yezbekiehs, with that of Abou-Nakod at their head. These two parties live in almost constant strife, except when they have a common foe to contend against, when they forget their internal dissensions and unite their strength for offense and defense. Their religion is a curious mixture of Judaism, Christianity, and Mohammedanism. They believe in one God, who is the only being to whom worship ought to be paid. According to their religious books he cannot be defined by any of the qualities belonging to created beings. The doctrine of the unity of the Deity does not admit, in their view, even of the consideration of any quality or attribute existing in him. They profess to believe in the unity of God with the abstraction of every quality and mode of existence. The Druses also believe that God has at different times appeared to men in a human form, and that his last appearance was under the name of Hakem, of Egypt, who announced himself at Cairo as a divine incarnation about 1030 A.D. They therefore regard Hakem as God, and they believe that he will one day return to earth, cause their religion to triumph, and punish the unbelieving. They have neither prayers, fasts, nor festivals, and, with the exception of a privileged class, the Akals, or initiated, they have no worship. When they go among the Turks they behave as Mussulmans, and in the midst of the Christian community of the Maronites they enter the Christian churches, and imitate the Christian believers in the use of the holy water. The uninitiated, called Jahils, are exempt from all religious duties whatever.

The Druses have also a peculiar moral code. They have seven commandments, a number taken from the sacred writings of the Mohammedans. The following, according to Hamsa, are their seven commandments, or cardinal principles: (1) Truthfulness; (2) mutual defense; (3) renunciation of all other religions;

(4) separation from evil spirits and perverse men plunged in error; (5) recognition of the unity of God at all times; (6) contentment in all labors; (7) patience in all circumstances. At the end of the 16th century this people began to excite attention in Europe. In 1588 they were made tributary to Turkey by Amurath III.; but in the beginning of the 17th century recovered their independence under the renowned Emir Fakreddin, and reached the summit of their power; but this leader was in 1635 strangled at Constantinople, and although other princes were placed over them, they never recovered their former reputation. They endeavored, indeed, by the assistance of the Russians in 1773, to regain their freedom; but they were soon obliged to become again dependent on the Turks. Troubles have more than once broken out between the Druses and the Maronites, their neighbors. An outburst of this kind occurred in 1860, and fearful atrocities were perpetrated upon the unhappy Maronites, who, however, seem to have been also aggressive. About 12,000 Maronites were killed and a large number were driven from their homes. A French force was sent out, and by its intervention tranquillity was restored. Since then, under a Christian governor appointed by the Porte, the Druses have been quiet. This outbreak resulted in the government of Lebanon about as it is at present. See **LEBANON**; **MARONITES**; **SYRIA**. Consult: Oliphant, 'Land of Gilead'; Carnarvon, 'Druses of the Lebanon.'

Drusilla, a daughter of Herod Agrippa I., king of the Jews. She was only six years old at the death of her father, 44 A.D., but had been betrothed to Epiphanes, son of Antigonus, who, however, refused to complete the match because one of its stipulations bound him to become a Jew. Azizus, king of Emesa, being less scrupulous, obtained her for his wife, but had not possessed her long when she divorced him to marry Felix, procurator of Judea. She is thus the Drusilla who is mentioned in the Acts, and was probably present when Paul preached before Felix.

Drusus, Marcus Livius, Roman politician: d. 91 B.C. Rome was divided by the disputes of the senate and the equestrian order. Drusus endeavored to gain over the people to the party of the senate by the division of lands, to which the senate agreed with the utmost reluctance, and to gain the Roman allies by the promise of citizenship. He came forward, relying on this assistance, as a mediator between the hostile parties. He succeeded in this, notwithstanding the most violent opposition from both parties, but the jealousy with which each party guarded its rights, and the rash and violent manner in which Drusus had effected the union, rendered him unpopular with both parties. On his return to his house from an assembly of the people, accompanied by a number of the Latins, he was stabbed at his door by an unknown hand. His death was the signal for the beginning of the social war which had been so long threatening.

Drusus, Nero Claudius, Roman general: b. 38 B.C.; d. 9 B.C. He was the first Roman general who penetrated to the German Ocean. He became prætor (11 B.C.), but returned in the next spring to Germany, subdued many tribes as far as the Weser, and commenced the erection

of fortresses. On this account he was appointed proconsul; the army saluted him with the title of *imperator*, which was not, however, sanctioned by Augustus. In 9 B.C. he was made consul, but returned soon after to Germany, and penetrated as far as the Elbe. The canal uniting the Rhine with the Yssel (*fossa Drusi*) was his work; and the place called Drusenheim, in Alsace, where he encamped for some time, received its name from him. His son Claudius afterward became emperor.

Dry Dock. See **DOCK**.

Dry-goods Trade, American. In the beginning of the dry-goods trade in America textiles were so often combined with other commodities to form the merchant's stock in trade, that it was difficult to determine where one began or ended. Trading of all kinds was of a generalized character, merchants handling alike dry-goods, groceries, and sundries in the same establishments. The stocks represented in such stores were incongruous in the extreme; cottons and silks from India, and velvets and woollens from Europe, were placed in juxtaposition with groceries and hardware. Trade in textiles was almost entirely of an import character, and the wholesale merchants, as a class, were either directly or indirectly importers. The extent of American cloth manufacture, as a factor in commerce, was inconsiderable. There were then few specialized industries or departments in trade or traffic. The distaff, the spinning-wheel, and the hand-loom were part and parcel of nearly every well-regulated household. The flax and the wool were raised, carded, spun, and woven at home, and the same hands that performed these offices also frequently fashioned the fabrics into wearing apparel for the use of the family. This state of things, as a matter of course, applied more fully to the common people. The rich or more prosperous classes of the community then, as now, imported many of the articles which formed their wardrobes, as well as their bed and table linen. Comparatively little attention was given to the culture of cotton. Its manufacture in an organized way, like wool, was confined to one or two establishments of crude construction and operation. They produced fabrics of no great commercial importance, save that they served to mark the initial stage or starting-point for the greater multiplication and diversification which have followed.

When it is considered that the inventions of Hargreaves, Arkwright, Paul, Crompton, and Cartwright had barely been adopted in this country at the close of the 18th century, the development of our textile industries since is simply marvelous. At the time referred to, our home products represented, in woollens, a few coarse cloths; in silks, a few lace and braid sundries; and in linens, some coarse sheeting and toweling. Our imports of foreign textiles during the same period were also of moderate proportions, being probably about double the value of the home product. In fact, from the close of the Revolutionary War until 1795, our imports of foreign dry-goods averaged yearly about \$24,000,000 to \$26,000,000, while the value of the home product varied between \$12,000,000 and \$13,000,000. The latter, being almost wholly of household manufacture, had but little representation in merchants' stocks.

The village stores in those early days were

DRY-GOODS TRADE

few and far between, and where they did find location, their stocks, so far as dry-goods were concerned, represented only a few of the coarser textures in woollens, linens, and cottons, with buttons and thread, associated with supplies of rum, molasses, and groceries. A considerable trade with towns located on the banks of inland streams was transacted by means of flatboats similarly stocked. In the cities the wholesale trade was almost entirely confined to the importers, who dealt in those foreign and home commodities, crude or manufactured, which were in the greatest demand and yielded the best profits. With the retail trade in the cities likewise, the distinction in the kind of goods handled by different dealers was not very marked, most of the shopkeepers selling a little of everything. In some of the larger cities, however, a slight tendency toward separate classification began to appear; that is, dry-goods and notions, in the more pretentious establishments, were to some extent sold to the exclusion of other commodities. But the general condition of the people—the fact that they supplied themselves with the manufactures of the household and preferred in many cases to barter rather than pay the cash—did not tend to develop early any very large retail establishments in separate lines of goods, even in the most populous cities.

In this connection it may be interesting to note that the imports of foreign merchandise paying ad valorem duties into the United States from 1795 to 1800 inclusive, amounted to nearly \$212,000,000, of which the textile part represented about two thirds. The kind and character of the latter—especially at New York, which was then, as now, the chief importing city of the country—may be readily inferred from the following names. They represented goods chiefly from India and China, and the cities of Amsterdam, Hamburg, Liverpool, and London, such as cottons, woollens, silks, velvets, linens, laces, edgings, hosiery, gloves, and shawls, including damasks, dimities, callimancoes, durants, tabarets, platillas, listadoes, mamoodies, gurrachs, cossas, baftas, russets, satinets, duffels, britannias, etc. Among the more important firms in New York importing or handling such goods about 1800 were: Bethune & Smith, Murray's Wharf; John Knox, 97 Water Street; McCready & Reid, 97 William Street; Hector & Scott, 125 Pearl Street; John & William Tabele, 260 Pearl Street; Richard & John Thorne, 141 Pearl Street; Benjamin I. Moore, 103 William Street; Charles J. Vogel & Company, 92 Maiden Lane; William Blackstock & Company, 163 Pearl Street; A. S. Norwood, 127 William Street; Robert & John Sharp, 93 Maiden Lane. These firms, with the exception of A. S. Norwood, who dealt almost exclusively in carpets, rugs, and besides handled dry-goods more largely, perhaps, than other houses, although among the latter, who sold them in connection with other foreign and domestic commodities, might be mentioned: Archibald Gracie, 52 Pine Street; James Stuart, 10 William Street; Eben Watson & Company, 36 Old Slip; Ferguson & Crichton, 84 Broadway; Rogers & Lambert, 232 Pearl Street; H. G. Rutgers & Company, 145 Pearl Street; Rutgers, Seaman & Ogden, 93 Front Street; Thomas Bulkley, 241 Front Street; Suydam & Wyckoff, 21 South Street; Robert Weir & Company, 16 Gold Street; John Knox, 97 Water Street; Thomas

Warren, 61 Maiden Lane; John McGregor, 84 Broadway; and Minturn & Barker, Thomas Napier & Company, Robert Lenox, Frederic de Peyster, Gouverneur & Kemble, John Murray & Sons, and others.

From 1800 to 1815 the country, its trade and industries, passed through some very trying ordeals—complications arising with France, the Embargo and Non-Intervention Acts going into effect, and everything finally culminating in the war with Great Britain. The restrictions upon our import trade during this period tended rather to foster our home industries than otherwise. In 1803 a serious panic prevailed in Great Britain, which materially affected our trade interests both at home and abroad. In 1804 the first consignment, for sale, of American cottons was made by Almy & Brown, of Providence, R. I., to Elijah Warren, of Philadelphia, Pa., who became their agent for yarns and threads, and afterward for stripes, plaids, checks, gingham, tickings, etc. The amount of domestic cottons sold in Philadelphia, the produce of New England factories, from 1804 to 1806 inclusive amounted to only \$17,670.

The Embargo went into force in 1807, and as a matter of course, almost wholly cut off our foreign trade. The cotton-spindles in the United States at this date amounted to about 4,000, showing that the progress made in this line of industry had been slow, although before the end of the year they had doubled, and by 1809, 17 mills were in operation in Providence, R. I., and vicinity, working 2,296 spindles, and producing about 510,000 pounds of yarn. About 1,000 looms were employed in weaving cotton cloth. The census returns for 1810 also gave further evidence of more or less rapid advancement being made in the manufacture of cottons and woollens, as well as in other industries. In round figures, according to the Treasury Department, the value of our product in cottons and woollens, exclusive of clothing and other goods, in 1810 was nominally about \$46,000,000. The invention of the cotton-gin by Eli Whitney had brought about a great change in both the production and the manufacture of cotton, so that it became our leading textile product.

In the years 1815-16 imports of foreign dry-goods were so enormous as to glut the markets and paralyze cotton and woolen industries as well. In fact, many of the leading importing and other merchants of the time were almost ruined by the unprecedented fall in the prices of goods and the general stagnation of trade and business resulting. This state of affairs was not entirely due to the results of the war, and the reopening of our ports to foreign traders who took advantage of the low rates of the ad valorem duties then prevailing, but was caused largely by the cotton and woolen manufacturers of Great Britain who unloaded their surplus stocks in our markets at prices below the cost of production, with the view to cripple our textile mills and control the trade of this country. In this they succeeded for the time and for some years later. Through the decades ending with 1820, 1830, 1840, and 1850, there is but little reliable official information to be gleaned from the census reports respecting our advancement in manufactures, if the year 1850 be excepted; but that it was gradual and steady is evidenced by the increased production of the spindles and the looms, especially in cottons and woollens,

DRY-GOODS TRADE

distributed by the general dry-goods trade. Our imports of textiles also kept growing apace, but not in like ratio to those of home production. This long period was eminently one of preparation and organization for both our dry-goods and our general textile-manufacturing interests. Many important inventions and processes were perfected during this time, such as the sewing-machine, power-loom, knitting-machine, and other mechanical devices, which not only changed but multiplied and diversified the textile manufactured products of the world, and thus created many of the subdivisions which are such important factors in the dry-goods trade to-day.

The wars, panics, depressions, conflagrations, and other vicissitudes through which the trade and country passed in the first half of the century seemed to spur manufacturers and merchants to make renewed efforts in the upbuilding of our industries. In the latter decade of it there set in a more marked tendency toward the diversification of products, and the inauguration of improved methods in their sale and distribution. The classification of goods was then carried to a much finer point than formerly, and the general trade, both wholesale and retail, outside of the regular dry-goods jobbing houses, began to make more or less separate distinctions in the goods which it sold. There were importers and wholesale dealers who handled special or distinct lines of goods, as silks and dress-goods; cloths, coatings, and cassimeres; notions and small wares; hosiery, underwear, and gloves; laces and embroideries; white goods and linens; and hats and caps. In the retail trade in the cities these distinctions, in many cases, were equally well outlined, although the stores in the larger towns and villages throughout the country still adhered more or less closely to the original policy of carrying miscellaneous stocks of merchandise. The evolution of the clothing trade, and, still later, that of made-up articles for women's and children's wear, not only brought the immigrant garment workers to the front in these particular lines of trade, but also, in the succeeding decades, made the classifications in manufacturing, wholesale, and retail circles still more minute and numerous. If there be added to these the development and more general utilization of the commercial agency and the commercial traveler systems, we have the grand factors in the extension and prosperity of the dry-goods trade of to-day. Indeed, when the year 1850 dawned we had reached the basis on which to build a broader national and industrial development. With the founding of new towns and cities in the interior, west and south, there came a larger and more diversified demand, with an increase of stores and shops, while newer and more varied articles of merchandise, suitable to the growing wants and tastes of the people, were being produced. In 1850 the value of our cotton and woolen products aggregated about \$112,000,000, while our combined textile output reached \$129,000,000. Our imports of foreign dry-goods for the same year approximated \$59,000,000. As compared with 1795, the former had increased about tenfold, while the latter had only about doubled. However, this is not altogether a fair showing, because the dry-goods trade handled large quantities of miscellaneous merchandise not strictly included in the textile class, which would largely

swell the total in sales, and make the increase in general distribution for the 55 years the more noteworthy and significant.

Thus it will be seen from the foregoing, that the year 1850 marked a new era in the history of the dry-goods trade of this country. Prior to it there was practically no domestic commission business done in New York. Boston, Philadelphia, and Baltimore were then the domestic commission centres. The product of the New England mills was mostly controlled by Boston houses. Philadelphia had 20 or more commission-houses selling all kinds of domestic goods, and it was the chief market for what were then designated as "blue goods," which comprised denims, checks, stripes, etc. Some of the Philadelphia houses were organized as early as 1832. About this time, also, a large quantity of dry-goods were sold in Hartford, Conn. New York was the market of this country for imported goods, and the importance of opening domestic commission-houses in that city then began to be recognized. At first the Boston merchants, agents of the Eastern mills, discouraged the project, and only a few of them were induced to open small offices in New York. Soon, however, it was found that in these small offices a larger business was being done than in the parent houses in the East, and so one house after another, and mill after mill, opened agencies in New York, and the business soon developed into extensive proportions. At this date the jobbing business of New York was still largely done downtown, on Broadway, Cedar, Pine, Liberty, and Broad Streets; there were no retail houses above Howard Street. Our home manufactures of textiles were still mostly of a common staple character, all the finer goods being imported from Europe.

In 1857 occurred the memorable panic, which for the time paralyzed the business of the country; and the dry-goods interest, being the largest and most diversified, suffered the most severely. A daily record of one of our New York houses, kept continuously from 1847 to the present time, notes 27 Aug. 1857, "the failure of the Ohio Loan and Trust Company, as the beginning of horrors." October of that year is recalled by all who took part in the struggle as a time which tried men's souls—and their bank-accounts. Numerous failures occurred, and many were the accounts of fortunate turns and of hairbreadth escapes from suspension and failure.

The imports of foreign dry-goods into the United States in 1860 amounted to \$112,350,000, while the value of our combined textile manufactures reached \$215,000,000. As contrasted with 1795, the former had increased nearly fivefold, and the latter nearly 18 times. It may be interesting to particularize some of the more important commercial and financial events during the Civil War which specially affected our dry-goods interests. In December 1861 cotton goods began to advance, and the average increase in prices during the first two years of the war was about 300 per cent. The following year showed a still sharper rise, and the high prices of the War culminated in the fall of 1864, when the average advance in prices of cotton goods from December 1861 was about 1000 per cent. In April 1864 raw cotton sold at \$1.90 per pound, and on 11 July gold reached 299. The period intervening between 1861 and 1864 was one of the sternest the mercantile world has ever

DRY-GOODS TRADE

known. In Europe it was known as the "cotton famine," regular shipments of the staple from the United States being almost entirely suspended. Gen. Lee's surrender occurred 9 April 1865, and on 30 June of that year cotton sold at 40 cents per pound. Manufactured cottons, however did not show proportionate decrease in price. In October following cotton had risen to 64 cents per pound, while prints, sheetings, etc., were about half the price which had been current for them in the fall of 1864. It was during this year that the largest dry-goods jobbing house, not only in this country, but in the world, distributed goods broadcast throughout the Union to the enormous amount of \$72,000,000. The imports of dry-goods in 1870 aggregated only \$98,290,000, while the value of the combined product of home manufacturers exceeded \$520,000,000. The increase, as compared with 1795, in imports was barely fourfold, while in home products it represented about 2500 per cent.

By 1880 the value of our textile products was nearly \$533,000,000, while our imports of foreign dry-goods approximated to \$136,000,000. The showing in this decade for home products did not exhibit a very large increase; still it must be borne in mind that our manufacturers encountered some very severe vicissitudes during this period, and besides, from the close of the War onward, there had been a gradual and steady decline in the prices of nearly all kinds and classes of textiles, due to the improving and cheapening of facilities for production. While the value of the output showed but little appreciable augmentation, the increase in quantity and variety was especially noteworthy. From 1881 to 1887 inclusive, Mulhall, one of the most reliable of foreign statisticians, estimates the aggregate value of the output of American textile manufactures at \$3,250,000,000, which would give an annual average value for the seven years of \$465,000,000. But he was considerably below the mark in his figures, since the output three years later (1890), according to the census reports, represented \$1,261,672,504, and in 1900 \$1,637,484,484.

But textiles only have so far been considered, and the dry-goods merchant of to-day, both wholesale and retail, handles multitudes of articles not included in that category which serve to increase his sales to a very large extent. Owing to the great subdivisions now existing in the trade, as well as to the fact that the large commission-houses, importers, jobbers, and retailers have intermixed dry-goods proper with many other lines of merchandise, it is utterly impossible to get at the exact value of the annual distribution. In fact, in the later decades of the century there has been a manifest disposition on the part of the large retail houses in our cities and more enterprising towns to buy and sell, like the early importers, promiscuous merchandise and wares in connection with dry- and fancy-goods proper. The census reports of the United States have divided the manufacturing industries into 363 classes, of which the dry-goods establishments of the present day contain not less than one sixth of the whole. In many of these stores are to be found nearly all the modern appointments and conveniences that serve to attract, please, and satisfy the wants of customers. The refectories, cash, delivery,

sample, mailing, and express systems are now some of the more prominent features of some of these establishments, which have patrons living thousands of miles away.

The wholesale departments have not lagged behind the retailers. The older importing and jobbing centres still maintain their due share of the country's trade, but it is centralized in fewer houses. The gain in trade and traffic by interior, western, and southern distributing centres represents no very material loss to the older eastern cities, from the fact that there has been in many instances such an unprecedented increase in the wants of the people of those sections, due to growth of population, geographical and other reasons, that the organization of wholesale distributing houses there became a necessity. An estimate of the textiles manufactured in this country during the past century, based upon the United States census reports and upon the figures of reliable statisticians, would place the aggregate value of the same at over \$20,000,000,000, while the imports of foreign dry-goods for the same period would probably represent one third of that amount, or nearly \$7,000,000,000. Adding to this total of \$27,000,000,000, the freight, insurance, exchange, and duties on the foreign part, and the sellers' profit on the whole amount as the goods reach the consumer, we would have the enormous aggregate of nearly \$40,000,000,000.

The present facilities for finding out the correct standing of "far-away merchants," not only as to their financial ability, but also as to their moral character, business habits, and general reputation, are so good that in adjusting credits space is in a great measure eliminated. Since the establishment of the first mercantile agency in 1841, these agencies have multiplied and improved so as to be of vast service in determining credits. While far from infallible, they are indispensable. The uniform courtesy existing between merchants in the exchange of references is also of great value, and with all the means of information now at hand the "far-off merchant" worthy of credit suffers no disadvantage by reason of distance from market. While rivalries exist, and rightly so, between merchants and between cities, it is worthy of note that petty jealousies are rapidly fading away. The development of this country is so great, and the interests of the people are so closely allied to one another, that anything affecting one part of the country affects the whole, and sectional differences and strifes are rapidly disappearing. The constant growth of this country in population, area, and wealth has a broadening influence upon the people.

In point of capital and labor employed, and magnitude of proportions, it has no equal. The tendency of this country to concentrate and to centralize business interests applies to the dry-goods trade in a very marked degree. The business is being more and more merged into large establishments. The present number of dry-goods houses in New York, for example, falls far below that of 25 or even 50 years ago; but the aggregate amount of merchandise sold there exceeds by far that in any previous period in the history of the city, and this notwithstanding the numerous large and important outlets which have since been added to the list.

JOHN N. BEACH,
Of Tefft, Weller & Company, New York.

DRY PILE—DRYDEN

Dry Pile, a very important form of galvanic battery, so named from the fact of its requiring merely a slight moisture among its leaves. Various kinds of dry piles are constructed. A very excellent one, Zamboni's dry pile, is made in the following way: Some sheets of paper, covered on one side with tin-foil or silver, such as are used for ornamental purposes, are moistened with sugar and water, and then rubbed over with very finely powdered black oxide of manganese. These are laid one on the top of the other, the silvered side of one being in contact with the oxide of manganese of the next. They are then cut with a punch into disks of about an inch in diameter, and they are put into a glass tube, care being taken that the order just mentioned is preserved. The tube is fitted at each end with a brass cap furnished with a knob, and it is filled so full that the paper disks are pressed firmly together. From 1,000 to 2,000 disks may be used. The knob at the oxide-of-manganese end will be found positively electrified, the other negatively. A pile containing 2,000 disks will charge a Leyden-jar. The glass tube is generally coated with shellac varnish to improve its insulating power. The sugar with which the paper is saturated is intended for a hygro-metric substance. If the pile be carefully kept it will preserve its power for many years. If it be artificially dried it loses it, but will frequently regain it when a sufficient amount of moisture has been absorbed from the air. Its action is quite similar to that of a galvanic battery. See BATTERY; ELECTRICITY; STORAGE BATTERY.

Dry Point, a sharp-pointed needle or instrument used by engravers to incise fine lines in copper without the plate being covered with etching-ground or the lines bit in by acid. This tool is much employed in working the more delicate portions of etchings, or in making whole pictures on copper called "dry-point" etchings. See ENGRAVING.

Dry Rot, a popular name for the decay of seasoned timber and for certain forms of decay of the trees while still standing. The latter kind is caused mainly by species of shelf-fungi and toadstools, which also attack the stumps of various trees. Economically, the former kind is the more important since it attacks timber after it has been put in place in buildings. In such cases the floors or walls may collapse with more or less damage to property, if nothing worse. The most common fungi producing this kind of dry rot are species of the genera *Polyporus* and *Merulius*, which produce similar effects. The spores germinate in the presence of moisture and the branching threads (*mycelium*) penetrate as far as the wood is moist, destroying the fibre of the wood. The fungus is at first white but later turns brownish-red, producing what is called "red-striped" timber. Drying only temporarily checks growth, for when moisture again reaches the wood the fungus recommences its work of destruction. The wood exposed to frequent changes of moistening and partial drying is most susceptible. But if properly seasoned and then protected by antiseptic treatment, or good paint, will be exempt unless the fungus has already gained entrance. In floors and walls only dry and non-alkaline sound-deadening substances should be used, since these do not favor the germination and growth of the spores which may be present.

Dry Tortugas, tôr-too'gas, Florida, a group of small coral keys or islets, 10 in number, at the western end of the Florida Keys, in the Gulf of Mexico, about 70 miles from Key West, lat. 24° 36' N.; lon. 82° 54' W. The principal keys are: East Key, Bird Key, and Loggerhead; and are a part of Monroe County. During the Civil War the Federal Government confined prisoners at Fort Jefferson, on one of the islands, and this practice has been continued. It also serves as a quarantine station.

Dryad, in Greek mythology, a nymph of the woods; a deity supposed to preside over the woods; a wood-nymph. Dryads differ from hamadryads in that the latter were attached to particular trees, with which they were born and died.

Dryas, (1) a famous Spartan, slain by Diana in the Theban war; (2) a genus of rosaceous plants found in Alpine and Arctic regions; they are small, prostrate shrubs with large white or yellow flowers; (3) a genus of butterflies, of which one species is *D. paphia*.

Dryburgh, the ruin of a Premonstratensian abbey in Berwickshire, five miles from Melrose, on the Tweed. It contains the tombs of Sir Walter Scott and his son-in-law, Lockhart.

Dryden, John, English poet: b. Aldwinkle All-Saints, Northamptonshire, 9 Aug. 1631; d. London 1 May 1700. He was educated at Westminster, and Trinity College, Cambridge. Left to find his way to distinction by his own exertions, he joined the Royalist party, and hastened to congratulate the king by publishing, in 1661, the verses entitled 'A Panegyric to His Sacred Majesty.' The theatres, which had been closed by the Puritans, now newly opened, after so long a silence, were resorted to with all the ardor inspired by novelty, and seemed to offer the most promising reward. He accordingly prepared for representation the 'Wild Gallant,' acted in 1662-3, but without success. Not cast down by his failure he brought forward the 'Rival Ladies,' which was well received. His next production was the 'Indian Emperor,' which at once raised Dryden to a high pitch of public estimation. The great fire of London put a stop for some time to theatrical exhibitions. In the interval Dryden published the 'Annus Mirabilis,' an historical account of the events of the year 1666, one of the most elaborate of his productions. In 1668 he also published his celebrated 'Essay on Dramatic Poesy,' the first attempt to regulate dramatic writing. The fame of Dryden was now at its height, and so confident was he of the readiness and ease with which he composed, that he entered into a contract with the king's company of players, by which he became bound to produce for them no less than three plays in the course of the year. This was, however, tasking his muse too highly, as he could only produce about half the number contracted for. In 1668 the 'Maiden Queen,' a tragi-comedy, was represented, with what success we are not told. This was followed in 1670 by the 'Tempest,' an alteration from Shakespeare, in which he was assisted by Sir William Davenant. It was received with general applause, notwithstanding the very questionable taste and propriety of the added characters. Dryden was shortly afterward appointed to the offices of royal historiographer and poet-laureate, with a salary of £200 a year.

DRYDEN — DSCHAKOWA

From this period till 1681 Dryden's life was passed in dramatic composition, and in repressing the insolences occasioned by the jealousy of the small wits of the day. In this time he produced about a dozen of plays, mostly with marked success. Stimulated to exertion by the state of parties, he produced, in 1681, 'Absalom and Achitophel,' which for powerful yet delicate satire is perhaps unsurpassed by any poem in the language. In the next year he published 'The Medal'; 'Mac Flecknoe,' and 'Religio Laici.'

Shortly after the accession of James II. Dryden became a Roman Catholic. At court the new convert was received with open arms; a considerable addition was made to his pension, and his pen was put in requisition to defend the cause which he had adopted. 'The Hind and the Panther' (1687), a polemical poem, in which the controversy between the Roman Catholics and Protestants is allegorically described, went rapidly through several editions, which is rather to be attributed to the fame of the author, and to the adventitious circumstances in which it was published, than to any disposition to acquiesce in its arguments.

At the revolution Dryden was deprived of the offices of poet-laureate and historiographer, and he again turned his attention to dramatic composition. His tragedy of 'Don Sebastian' is of this period. It was at first coolly received, though brought out with great splendor, and it was not till several retrenchments and alterations were made that it rose to that high place in public estimation which it so long maintained. His last play, 'Love Triumphant,' was acted in 1694. During the year previous he had published, with Congreve, Creech, and others, a translation of Juvenal, and one of Persius entirely by himself. About a third part of Juvenal was translated by Dryden, who wrote an essay on satire which was prefixed to the whole. His translation of Virgil appeared in 1697, and so eagerly was it sought after that a new edition was called for in the course of the first six months. Dryden had hardly finished 'Virgil' when he distinguished himself by his immortal 'Ode to St. Cecilia,' commonly known by the name of 'Alexander's Feast.' In 1699 he published his 'Fables,' imitations of Boccaccio and Chaucer. He was buried in Westminster Abbey, between the graves of Chaucer and Cowley.

As a poet Dryden stands very high. What was said of Rome, adorned by Augustus, has been applied by Johnson to English poetry, improved by Dryden—he found it of brick, and left it of marble. In his hands it lost the harshness which distinguishes the writings of Donne and of Cowley, and became eminently harmonious and powerful, but often somewhat turgid. His power of satire is unrivaled. While the lesser poets of the day were encumbering it with foul invective, he struck out a new path in the art. His strong and trenchant blade cut deep, while the coarse weapons of his rivals would not penetrate the surface. Of his powers as a tragic poet his 'Don Sebastian' affords the best example. His comedies are unfortunately stained by the license of the age. See Saintsbury, 'Dryden' (1881); Garnett, 'Age of Dryden' (1896).

Dryden, N. Y., village, in Tompkins County; on the Lehigh V. R.R.; noted principally as a health resort on account of its min-

eral springs. The village of Freeville, noted for the George Junior Republic (q.v.), is nearby. Pop. 700.

Drying Machine, originally a machine for drying printed calicoes. The apparatus is in a hot room, and has a series of heated steam chests and cylinders with upper and lower rollers, over which the cloth is exposed to the drying air of the apartment. Similar drying cylinders are now used in paper-making machines, both the cylinder machines and those of the Fourdrinier pattern, in which the sheet of pulp is felted on an agitated horizontal web. Drying machines are also used in bleaching, drying, and laundry works; the cylinders, in which the articles to be dried are placed, being made to revolve with great speed, the moisture is thus driven away by the action of centrifugal force. A recent method of drying wool and other textile material is by the Blackman air-propeller. The wool is spread over a perforated surface which is in connection with a revolving propeller, with peculiarly shaped blades, placed at the top of a vertical trunk or shaft. This apparatus dries the wool by drawing heated air through it and expelling the air at the top through a turret in the roof of the building in which it is placed. Yarns are frequently dried by passing through a hot chamber, by means of continuous chains, upon which rollers carrying the hanks are placed.

Dryobalanops, dri-ō-bāl'a-nops, a small genus of trees found in the Malay Archipelago. The principal species is remarkable as the source of the Borneo or Sumatra camphor, which is found filling cracks and crevices in the wood. See CAMPHOR.

Dry'ophis, a genus of non-venomous, colubrine tree-snakes of India and Malay countries, called whip-snakes owing to the extreme slenderness of their long and flexuous bodies. They move very awkwardly on a smooth surface, but when twining and climbing among branches of trees, whose foliage they simulate in color, they are swift and graceful in the extreme. While retaining their hold by means of a few coils of the tail, their length enables them to dart forth the head to a great distance and seize some lizard or bird unaware of their proximity.

Drysdale, William, American journalist and author: b. Lancaster, Pa., 11 July 1852; d. Cranford, N. J., 20 Sept. 1901. In 1876 he was editor of the Philadelphia *Times*; and for over 20 years was on the staff of the New York *Times*, acting as its foreign correspondent (1877-99). He was a popular writer of juvenile stories, and his books have had a wide circulation. They include: 'Proverbs from Plymouth Pulpit' (1887), selections from the writings and addresses of Henry Ward Beecher; 'The Princess of Montserrat' (1890); 'The Mystery of Abel Forefinger' (1893); 'The Young Reporter' (1895); 'The Fast Mail' (1896); 'The Beach Patrol' (1897); 'Helps for Ambitious Boys' (1899); 'Helps for Ambitious Girls' (1900); 'The Treasury Club' (1900); 'Pine Ridge Plantation' (1901); 'The Young Consul' (1901).

Dschakowa, dyā-kō'vā, or **Dyakova**, Turkey, city, in the northeast of Albania, on the Grenik, 63 miles east-northeast of Scutari. It contains six mosques, a Roman Catholic and a Greek church. Pop. about 25,000.

Dual, in grammar, that number or inflection which is used in some languages when two things are spoken of, whilst another number (the plural) exists to express many. The dual in some languages is a firmly-established grammatical form, as in the classical Greek; in other languages it is used only in certain cases with certain words, or only faint traces of it are to be recognized. The Sanskrit has a dual number. In modern languages which have a literature, Arabic is the only idiom which has retained it. The Anglo-Saxon had a dual in the declension of the first and second personal pronouns; for example, *wit*, we two; *git*, you two; *uncer*, of s two; *incer*, of you two.

Dual Personality, (1) the supposed distinction, and potentially independent action, of each of the cerebral hemispheres; from one of which, the left, arise all the good and ennobling aims of life, while from the other come all the malevolent influences. (2) The heretical doctrine attributed to Nestorius of the two-fold personality of Christ.

Du'alín, an explosive compound containing 30 parts of fine sawdust, 20 of saltpetre, and 50 of nitroglycerin. Also called dualin-dynamite. See EXPLOSIVES; NITROGLYCERIN; etc.

Du'alism, Dualist. Dualism is the opposite of monism, the philosophical exposition of the nature of things by the adoption of two dissimilar primitive principles, not derived from each other: such, for instance, are the ideal and the real, or matter and spirit. Sir William Hamilton divides dualists into natural dualists (or natural realists), who believe that we have an immediate knowledge both of mind and matter; and hypothetical dualists (or cosmothetic idealists), who believe that we have an immediate knowledge of nothing but mind, but who nevertheless, by various reasonings and arguments, attempt to prove the real existence of an external world. In a stricter sense dualism is confined to a) the adoption of two fundamental beings, a good and an evil one, as is done in some Oriental religions; (b) to the adoption of two different principles in man, namely, a spiritual and a corporeal principle: this is called the psychological dualism.

Duane, James, American jurist: b. New York 6 Feb. 1733; d. Duaneburg, N. Y., 1 Feb. 1797. He established a settlement at Duaneburg in 1765; took up the practice of law, and became prominent in his profession. Having bought a considerable amount of land in the territory known as the New Hampshire Grants, now included in the State of Vermont, he was one of the principal advocates of New York's right to that territory; and when New York officials were driven out by Ethan Allen and his followers, Duane was the leader of those who induced the legislature to declare the Vermonsters traitors and outlaws. He was elected to the first Continental Congress, and was a member of the Congress throughout its existence. He was a supporter of the conservative party, believing in the English form of government and opposed to republicanism, and he stood against the signing of the Declaration of Independence, striving to delay, and if possible prevent, separation from England. He returned to New York after its evacuation by the British, and was the first mayor under the new

charter (1784-89); was a member of the committee to draft the State Constitution of New York; sat in the State Senate 1782-85, and 1789-90; and was United States district judge 1789-94.

Duane, James Chatham, American military engineer: b. Schenectady 30 June 1824; d. New York 8 Nov. 1897. He was graduated from West Point in 1848, and was instructor there for a time. He was engineer in charge with the Utah expedition 1858, and served in the Civil War with the Army of the Potomac and the Army of the South. In 1865-68 he had charge of the construction of defenses at the eastern entrance to New York harbor; was lighthouse engineer for the northeast Atlantic coast, and superintendent of fortifications in Maine and New Hampshire; in 1886 he became chief of engineers with the rank of brigadier-general, and retired in 1888. From 1888 to 1897 he was one of the Croton aqueduct commissioners.

Duane, William, American politician: b. near Lake Champlain, N. Y., 1760; d. Philadelphia, Pa., 24 Nov. 1835. He learned printing, and in 1784 went to seek his fortune in India. He rapidly amassed property, and became editor of an Indian journal, entitled the 'World.' Having taken sides against the local government in a dispute with some of its troops, he was seized and sent to England, and his large fortune was confiscated. In 1795 he returned to America, and became editor of the 'Aurora,' published at Philadelphia, which was made by his able management the most influential organ of the Democratic party; so much so, that Jefferson attributed to its vigorous support his own election to the Presidency. The change of the seat of government from Philadelphia to Washington caused the 'Aurora' to decline in political importance. Duane retired from its editorship in 1822, and then traveled through the republics of South America. On his return he published 'A Visit to Colombia' (1826). His other works include 'Military Dictionary' (1810); and 'Handbook for Riflemen' (1813), which were for some time standard authorities.

Duane, William John, American politician: b. Clonmel, Ireland, 9 May 1780; d. Philadelphia 26 Sept. 1865. He was a son of William Duane (q.v.). Appointed secretary of the treasury by President Jackson in 1833 he was removed from office the same year because of his refusal to allow the government deposits in the United States Bank to be removed without the authorization of Congress.

Duban, Jacques Félix, zhāh fā-lēks dü-bān, French architect: b. Paris 14 Oct. 1798; d. Bordeaux 20 Dec. 1870. He studied under Debret, and his first work of importance was the completion of the Palais des Beaux Arts, in the execution of which he is charged with having sacrificed harmony of proportion and strength to a fondness for ornamentation. In 1845 he was employed in the restoration of the ancient chateau of Blois, and in 1848 was appointed architect of the Louvre. The façade on the river side, and the Apollo gallery, were restored from his plans.

Du Barry, Jeanne Bécu, zhāh bā-kü dü bā-rē, COMTESSE, mistress of Louis XV: b. Vaucouleurs 19 Aug. 1746; d. Paris 6 Dec. 1793.

DU BARTAS—DUBLIN

She was presented to the King in 1769, who had her married for form's sake to the Count du Barry. She exercised a powerful influence at court, and with some of her confidants completely ruled the King. Important offices and privileges were in her gift, and the courtiers abased themselves before her. After the death of Louis she was dismissed from court and sent to live in a convent near Meaux. She received a pension from Louis XVI. During the Reign of Terror she was arrested as a royalist and executed.

Du Bartas, dü'bār'tā', Guillaume Salluste, French poet: b. Montfort, in the department of Gers, 1544; d. Ivry 14 March 1590. He undertook various diplomatic missions to foreign courts for the Huguenot cause; fought in the Huguenot army and was killed in the battle of Ivry. His fame rests upon two epic poems, the second unfinished, entitled 'La Sepmaine' (The Week) and 'La Seconde Sepmaine.' The first, which is far the better of the two, describes the creation of the world; the second the period from the creation to the incarnation of Christ. These poems were very popular in France, and in 1598 Joshua Sylvester translated them into English.

Du Bellay, Jean, zhōn dü bēl-lā, French cardinal and statesman: b. 1492; d. Rome 16 Feb. 1560. He enjoyed the favor of Francis I., and was sent as ambassador to Henry VIII. of England and the Pope, Paul III. He became Bishop of Bayonne in 1526, Bishop of Paris in 1533 and Cardinal in 1535. He was appointed lieutenant-general of the kingdom during the absence of Francis, who was engaged against the Emperor Charles V. in Provence. Falling into disgrace on the death of this king, he retired to Rome. Du Bellay protected and encouraged letters, and it was at his suggestion that the College of France was founded. Rabelais was attached to his establishment.

Dubbs, Joseph Henry: b. North Whitehall, Pa., 5 Oct. 1838. He was graduated at Franklin and Marshall College 1856, and at the Mercersburg Theological Seminary 1859. After several pastorates in the Reformed Church he became in 1875 professor of history and archaeology in Franklin and Marshall College. He is a member of various ethnographic and historical societies in the United States, Great Britain, and France, and has published: 'Historic Manual of the Reformed Church' (1885); 'Home Ballads and Metrical Versions' (1888); 'Why am I Reformed?' (1889); and a large number of historical monographs, addresses, etc.

Dublin, Ireland, on the river Liffey, within a mile of Dublin Bay. The Liffey divides the city into two equal parts. From the point where the Liffey enters the bay it is embanked on either side with a wall of freestone, forming a range of spacious quays through the whole city. The river is crossed by nine handsome bridges, six of stone, two of iron, and one swivel-bridge. Dublin is also nearly insulated by two canals, very important for inland communication. The houses, with the exception of the principal public structures, are generally brick, and from three to five stories high. The principal thoroughfares are toward the south side of the city. Grafton Street is the busiest commercial locality in Dublin, and Westmoreland Street, connecting the south side by O'Connell Bridge with Sackville

Street, which contains monuments to O'Connell and Nelson. The O'Connell Bridge, formerly called Carlisle Bridge, was rebuilt and opened for traffic in 1880. A line of railway, called the "Loop line," joins the north and south sides of the city, and forms a through connection between the four railroad systems of Ireland.

In the centre of the south side stands Dublin Castle, on a slight elevation, originally built early in the 13th century. It is now the official residence of the Lord-Lieutenant of Ireland, but is more remarkable for size than for architectural features. The castle chapel is an exquisite specimen of Gothic architecture. East from the castle, and facing College Green, is the Bank of Ireland, formerly the Irish Parliament House, a large and elegant structure, with a noble colonnade of Ionic pillars. At right angles to the bank, and facing the same area, is Trinity College, an imposing modern structure of the Corinthian order. The pile of buildings known as the Four Courts, stretching along King's Inns Quay has a portico of six Corinthian columns. It accommodates the courts of chancery, queen's bench, common pleas, and exchequer, which are now united under the title of The High Court of Justice. The most important of the other public buildings are the custom-house, with a cupola 125 feet high; the King's Inns, the post-office, rotunda, corn exchange, the mansion-house, corporation buildings, sessions house, the Wellington military barracks, Mountjoy convict prison, North and South Union workhouses, south city markets, Christian Union buildings, Royal College of Surgeons, the Science and Art Museum, the Leinster Hall, and the four railway stations.

The most important literary and scientific institutions are Trinity College; the Royal University of Ireland; the Roman Catholic University College; Wesley College; the Royal Dublin Society; the Royal Hibernian Academy of Painting, Sculpture, and Architecture; the Royal Irish Academy; the Archaeological Society; and the Royal Zoological Society. The principal libraries, besides that of Trinity College, are the National Library; Marsh's Library, containing about 18,000 volumes; and that of the Royal Dublin Society. At Marlborough House are the extensive buildings in which the National Board of Education has its chief offices. They consist of two training colleges for teachers, with practising schools, professors' offices and book-stores. In the centre of College Green is an equestrian statue of William III., erected in 1701, and in front of Trinity College are bronze statues of Burke and Goldsmith. There are also statues of O'Connell, Moore, Grattan, Smith O'Brien, Sir John Gray, and others. In the Phoenix Park is an obelisk, 210 feet high, in honor of the Duke of Wellington. Glasnevin Cemetery, to the north of Phoenix Park, contains memorials to O'Connell, the "Manchester Martyrs," Curran, Hogan, and others.

Dublin contains two Protestant Episcopal cathedrals—St. Patrick's and Christ Church. St. Patrick's Cathedral is an antique building, erected in 1190. Between 1860 and 1865 it was restored at a cost of £150,000 by Sir B. L. Guinness, M.P. Christ Church, built in 1038, the ancient cathedral of Dublin, is another venerable pile. In 1878 it was reopened after being restored at a cost exceeding £200,000. St. George's Church is of pleasing architecture; and

DUBLIN

a fine Presbyterian Church is in Rutland Square. The Roman Catholic Cathedral in Marlborough Street is a large edifice. The charitable institutions are numerous, and some of them possess splendid buildings. They include among them the Royal Hospital for disabled soldiers, designed by Sir Christopher Wren; several infirmaries; the lying-in hospital; two lunatic asylums, one of which, St. Patrick's, or Swift's Hospital, was founded by Dean Swift. The Royal Barracks, affording accommodation for 5,500 men, are in the west end of the town, near the river. There are several other military barracks.

A little northwest of the city, up the Liffey, is the Phoenix Park, one of the most extensive and beautiful public parks of which any European city can boast. Its area is 1,759 acres. In the Phoenix Park are the Vice-regal Lodge, the residence of the lord-lieutenant; the chief secretary's and under-secretary's official residences; the Royal Hibernian Military School and the depot of the Royal Irish Constabulary; also the gardens of the Royal Zoological Society. In 1880 St. Stephen's Green, on the south side of the city, became a public park through the munificence of Lord Ardilaun; and in 1887 Killiney Hill also was opened as a public park by Prince Albert Victor.

The manufactures carried on in Dublin are of little note. The poplins, a fabric of silken warp and woolen weft, for which Dublin has long been celebrated, are still in some demand, and there is considerable brewing and distilling. The trade by water is important, the tonnage of the shipping entered and cleared amounts to considerable each year. Dublin returns four members of Parliament. Pop. (1901) 289,108.

Dublin, University of. The first university of Dublin was founded in 1320 in connection with Saint Patrick's Cathedral. Having no endowment, and owing to changes in government and religion throughout the country, the university gradually declined, until it ceased to exist in the reign of Elizabeth. The present university was founded in 1591, when a charter, or letters-patent, was granted by Queen Elizabeth for the incorporation of the "College of the Holy and Undivided Trinity." This college is stated in the charter to be incorporated as the "mother of an university," whence it appears that it was intended to be only the first of a number of colleges to be afterward established in connection with the same university, the senate of which is incorporated by a charter distinct from that of Trinity College. Up to this time, however, no other such colleges have been established, so that Trinity College alone still enjoys the rights of the university. Although Elizabeth promised much, but little was done by the Crown for the support of the institution. The suppressed monastery of All Hallows was given to the new university and a fund was raised among the Irish nobles. Under James I. more aid in money and lands was given to the school. In 1637 changes were made in the constitution of the university.

The members of the corporation consist of a provost, 7 senior fellows, 26 junior fellows, and seventy foundation scholars. The management of the college is entrusted to the provost and senior fellows in conjunction with the visitors and the council, the last named body consisting of the provost, four senior fellows,

four junior fellows, four professors who are not fellows, and four other members of the senate. The senate of the university, as incorporated by royal charter, consists of "the chancellor of the university, or, in his absence, of the vice-chancellor, and such doctors or masters of the university as shall have and keep their names on the books of Trinity College." The senate possesses, under prescribed conditions, the right of electing the chancellor of the university. It is also the body which grants degrees; subject to the sanction of the college board and of the caput of the senate. This latter body consists of the chancellor or vice-chancellor, provost (or vice-provost), and the senior master non-regent, and every member of the caput has the right of refusing a degree by a veto. The fellows are appointed for life. The senior fellows are promoted from the number of the junior fellows in order of seniority, and every vacancy among the junior fellows is filled up by the provost and senior fellows after a strict examination for 12 days in mathematics, pure and applied, experimental sciences, classics, with Hebrew and cognate languages, and mental and moral science. The scholars are chosen from among the undergraduates, after an examination in pure and applied mathematics and logics or experimental science, or in Greek, Latin, and English composition. Non-foundation scholars are not members of the corporation of the college. Scholars receive an annual salary of £20, have their commons free of expense, and their rooms for half the charge paid by other students. They hold their scholarships until the end of the June quarter of the fifth year following their election, or following the time at which they become or might have become masters of arts, whichever period terminates first. Students, before being admitted, must submit to an examination in Greek, Latin, arithmetic, English composition, history, and geography. Students may enter as belonging to one of four classes. The first consists of noblemen, noblemen's sons, and baronets. The second consists of the fellow-commoners (who dine at the fellows' table). The third and most important is the class of pensioners, forming the great body of the students; and the fourth is the sizars, who are partially maintained out of the college funds and are now admitted by competitive examination. These last are limited to 30 in number. The academical year is divided into three terms—Hilary, Trinity, and Michaelmas term. To obtain the B.A. degree the student must keep eight terms in all, covering normally four academic years. Terms are kept during the undergraduate course, either by lectures or by examinations, but terms in divinity, law, medicine, and engineering must be kept by attendance on the lectures of the professors. The system of instruction is superintended by the fellows, together with a large staff of professors. Several of the junior fellows act as tutors, and every student must place himself under one of these on entering the college. The tutors during term deliver lectures on the subjects necessary to a degree. These are: In the first year, mathematics, Greek, Latin, English composition; in the second year, mathematics, mathematical physics, logic, Greek, Latin, English composition; in the third year, logic, mathematical physics, English composition, Greek, Latin, experimental and natural science, astronomy, history, French, German; and in the

fourth, astronomy, ethics, English composition, logic, mathematical physics, languages, experimental and natural science, history, and political science. During the first academic year a student is called a junior freshman; during the second, a senior freshman; during the third, a junior sophister; and during the fourth, a senior sophister. Students who have successfully passed all the necessary examinations in the course given above, have the degree of B.A. conferred on them by grace of the senate in full congregation. Those who wish to obtain honors must pass through a more extended course of study. Honors are attainable in seven departments: 1, mathematics and mathematical physics; 2, classes; 3, logic and ethics; 4, experimental science; 5, natural science; 6, history and political science; 7, modern literature. Those who successfully pass the examinations in any of these departments are classed according to merit as senior or junior moderators, and respondents. Noblemen and noblemen's sons are entitled to have the degree of B.A. conferred on them *per specialem gratiam*; and fellow-commoners are entitled to receive it with one term-examination less than pensioners. The degrees are conferred on commencement days, of which there are four in each year. There are divinity, law, medical, and engineering schools in connection with the university, and degrees or licenses in each of these branches are granted by the university senate on the completion of the prescribed courses. The degrees of D.Sc. and Litt.D. are conferred on B.A.'s who have shown certain scientific or literary claims. The degrees of bachelor and doctor in music are also conferred.

The college possesses a fine library of about 250,000 printed volumes and 1700 manuscripts; and the number is increased annually by about 1,500 volumes, which are partly purchased and partly obtained under the copyright act. It has also a well-stocked botanic garden and museum. The observatory, five miles distant, at Dunsink, is the official residence in Ireland of the royal astronomer. In 1613 James I. granted to the university the right of returning two members to Parliament. One was taken away at the Union, but was restored by the reform bill of 1832. The parliamentary constituency consists of the provost, fellows and foundation scholars, ex-fellows and ex-foundation scholars, masters of arts, surgery, and engineering, and graduates holding all higher degrees.

Duboc, dü-bök', Julius, German author: b. Hamburg 10 Oct. 1829; d. June 1903. He studied at Giessen, Leipsic and Berlin; and wrote much for the leading liberal periodicals, especially the 'National Zeitung.' He published 'Geschichte der Englischen Presse' (1873); 'Die Psychologie der Liebe' (1874); 'Das Leben ohne Gott' (1875); 'Gegen den Strom' (1877); a collection of his earlier essays: 'Der Optimismus als Weltanschauung' (1881); 'Jenseits von Wirklichen' (1896); and 'Fünfzig Jahre Frauenfrage in Deutschland,' a collection of essays on the woman question.

Dubois, dü'bois', Augustus Jay, American engineer: b. Newton Falls, Ohio, 25 April 1849. He was graduated at Sheffield Scientific School in 1869; in 1874 was appointed professor of civil engineering at Lehigh university, and in 1876 professor of mechanical engineering at Sheffield Scientific School. After 1884 he was professor

of civil engineering at the last institution. He has published 'Elements of Graphical Statics' (1876); 'The New Method of Graphical Statics' (1876); 'Strains in Framed Structures' (1883; 11th edition, 1900); 'Elements of Mechanics' (1893-5).

Dubois, Clément François Théodore, klāmôn frän-swä tä-ô-dör dü-bwä, French musical composer: b. Rosnay (Marne) 1847. He studied at the Paris Conservatory, and won the Prix de Rome in 1861. He was organist at the Church of the Madeleine, professor of harmony, then professor of composition at the Conservatory, and finally became director of that institution. In 1894 he became a member of the Academy of Fine Arts. His compositions include the cantata, 'Atala'; the operas, 'Aben Hamet'; 'Xaviere'; and 'Circe'; the oratorios, 'The Seven Words of Christ', and 'Paradise Lost'; 'The Baptism of Clovis'; and a number of organ pieces, masses, etc.

Du Bois, dü-bois', Constance Goddard, American author: b. Zanesville, Ohio. She has been an active supporter of efforts to improve the condition of the Mission Indians of Southern California. She has published 'Martha Corey: a Tale of the Salem Witchcraft' (1890); 'Columbus and Beatriz' (1892); 'A Modern Pagan' (1895); 'The Shield of the Fleur-de-Lys' (1895); 'A Soul in Bronze' (1900).

Dubois, Edmond Paulin, őd-môn pō-lähn dü-bwä, French hydrographer: b. Brest 12 July 1822; d. there 11 Nov. 1891. He made voyages in the Indian Ocean and along the west coast of Africa; and in 1851 was made professor at the Ecole Navale in Brest. He invented a compass with a double needle to determine the variation due to the ship's ironwork, and wrote 'Cours d'Astronomie' (1858); 'Etude historique et philosophique sur le Mouvement du Globe' (1861); 'Les Passages de Vénus sur le Disque Solaire' (1883); 'Cercle nautique' (1888); and edited the 'Ephémérides Astronomiques.'

Dubois, Guillaume, gē-yōm, French cardinal and statesman: b. Brives-le-Gaillard, Corrèze, France, 6 Sept. 1656; d. Versailles 10 Aug. 1723. He became tutor to the Duke of Chartres, afterward Duke of Orleans, and when in 1715 the Duke was declared regent, Dubois was appointed by the Duke counselor of state. He succeeded in overcoming the dislike of George I. of England to the person of the regent, and in 1717 concluded the triple alliance between England, France, and Holland. He was rewarded by the ministry of foreign affairs, and began to aspire to the highest dignities of the church. The archbishopric of Cambrai having become vacant, Dubois ventured to request it of the regent, although he was not even a priest. As the king of England united with Dubois in his request, he obtained it, and in one morning received all the orders, and a few days after, the archbishopric. By his consummate address he obtained a cardinal's hat, and in 1721 was appointed prime minister.

Dubois, Jean Antoine, zhōn ān-twān, French abbé and missionary: b. Saint-Remèze, department of Ardèche, 1765; d. Paris 7 Feb. 1848. He spent 32 years in the East Indies, and on his return published 'Letters on the State of Christianity in India' (1823); which produced

DUBOIS — DUBUQUE

much controversy in England from the fact of his having frankly expressed therein his disbelief in the possibility of the conversion of the Hindus. He wrote several works relating to the religion and the traditions of India, and many contributions to the 'Bulletin des sciences,' and to the journals of the Asiatic societies of London and Paris. His most celebrated work, 'Description of the Character, Manners, and Customs of the People of India, and of their Institutions, Religious and Civil,' was purchased for £800 by the East India Company, published at its expense in London in 1810, and afterward published in French under the title of 'Mœurs, institutions, et cérémonies des peuples de l'Inde' (1825).

Dubois, John, American Roman Catholic bishop: b. Paris 24 Aug. 1764; d. 20 Dec. 1842. As student in the College Louis le Grand he had as fellow students Camille Desmoulins and Robespierre. In 1781 he was ordained priest. With thousands of others of other ecclesiastics he was forced to flee from France in the Revolution and came to the United States in 1791. His first charge in this country was at Norfolk, Va., whence he was transferred to Richmond; there he was for a time a guest in the house of James Monroe and was the friend of prominent citizens, Patrick Henry undertaking his instruction in the English language. From Richmond he was transferred to Frederick, Md., the only priest then stationed between Baltimore and St. Louis. In 1809 he founded Mount St. Mary's College near Emmitsburg, Md., and was its first president, occupying at the same time two or three professorships. In addition he assumed the duties of chaplain and director of the house of the Sisters of Charity then founded by Mrs. Seaton in the neighborhood of Emmitsburg. He was subsequently appointed Bishop of New York, the diocese including that State and New Jersey, with a Catholic population of 150,000 souls, 8 church buildings and 18 priests. Owing to old age and increasing infirmities in 1838 he obtained a coadjutor in the person of John Hughes, who became his successor.

Dubois, Louis, loo-ē, Belgian painter: b. Brussels 1830; d. there 28 April 1880. He was one of the most prominent painters of the realistic school, and worked equally well as a painter of portraits, marines, still life, and landscapes. Among his works deserving mention are: 'The Rice Eater'; 'The Meuse'; 'Priests Preparing for Mass'; and 'The Billiard Player.'

Dubois, Paul, pōl, French sculptor: b. Nogent-sur-Seine 18 July 1829. In 1837 he entered the College Louis le Grand, and later took up the study of law, which he followed until his 27th year, when he became a pupil of Tousseint (q.v.). In 1863 he exhibited 'Narcissus at the Bath,' now in the Luxembourg, and in 1864, a bronze of John the Baptist as a young man. 'The Florentine Minstrel,' also in the Luxembourg, is his most popular work. Among his productions is a successful statue of 'Joan of Arc,' in Rheims. The most elaborate of his sculptures is a tomb in Nantes Cathedral, decorated with many statues and bas-reliefs. He is also a painter. He was made an officer of the Legion of Honor in 1867, and became grand officer in 1889. He is a director of the Luxem-

bourg, and also of the National School of Fine Arts.

Du Bois, du-bois', William Edward Burghardt, American educator: b. Great Barrington, Mass., 23 Feb. 1868, of negro descent. He was graduated at Fisk University 1888, and at Harvard 1890, subsequently studying at the University of Berlin. He has been a Fellow of Harvard, assistant in sociology at the University of Pennsylvania, and since 1896, professor of economics and history in Atlanta University. He has published: 'The Suppression of the African Slave Trade to the United States, 1638-1870' (1896); 'The Philadelphia Negro' (1899); 'Relation of the Negro to the Whites in the South' (1901); 'Souls of Black Folk' (1903); 'The Negro Artisan: Report of a Social Study' (1903), in the Atlanta University publications, of which he is general editor.

Du Bois-Reymond, Emil, ā-mēl dü bwā-rā-mōh, German physiologist: b. Berlin 7 Nov. 1818; d. there 26 Dec. 1896. He studied theology, geology, and latterly anatomy and physiology at Berlin under Johann Müller, whom he succeeded as professor of physiology in the University of Berlin in 1858. In 1867 he became permanent secretary of the Berlin Academy of Sciences. His principal publication is 'Researches in Animal Electricity' (1848-84); but he published several other technical works, and also some lectures of which the chief is entitled 'Ueber die Grenzen des Naturerkennens'.

Dubois, dü-bois', Pa., a borough, county-seat of Clearfield County; on the Buffalo, R. & P., and the Allegheny V. R.R.'s; about 80 miles northeast of Pittsburg. It is in a coal mining region, and besides its mining interests, it has iron works, flour and lumber mills, and tanneries; a large amount of mining and agricultural implements are manufactured. Pop. 9,500.

Dubovka, doo-bōf'kă, Russia, city, in the government of Saratov, on the Volga. It has an extensive river trade in wool, iron, oil, and grain. Pop. (1902) 17,123.

Dubufe, Claude Marie, klōd mā-rē dü-būf, French painter: b. Paris 1790; d. 24 April 1864. He was a pupil of David; among his works are: 'Achilles Protecting Iphigenia'; 'Christ Still-ing the Tempest'; 'Release of St. Peter'; 'Surprise'; 'Village Girls of Normandy'; and portraits of Louis Philippe and the Queen of the Belgians.

Dubufe, Edouard, ā-doo-ār, French painter: b. Paris 30 March 1820; d. Versailles 10 Aug. 1883. He was a pupil of his father, Claude Marie Dubufe (q.v.), and of Delaroche. Among his works are portraits of the Empress Eugénie, Rosa Bonheur, Gounod, the Younger Dumas, and Emile Augier; also a number of religious paintings, including 'The Prodigal Son.'

Dubufe, Edouard Marie Guillaume, ā-doo-ār mā-rē gē yōm, French painter: b. Paris 16 March 1853. He is a son of Edouard Dubufe (q.v.). Among his paintings are 'St. Cecilia'; 'Music, Sacred and Profane'; 'Autumn'; 'The Flight into Egypt'; and several portraits. He has also decorated the Hôtel de Ville in Paris and the Salle des Fêtes de l'Elysée.

Dubuque, doo-būk', Iowa, city, county-seat of Dubuque County; on the Mississippi

River, the Burlington, the Chicago G. W., the Chicago, M. & St. P., and the Illinois C. R.R.'s, 189 miles northwest of Chicago. It has steamer communication with the leading ports on the Mississippi and is connected with the opposite shore of the river by two bridges. The city is built partly on a terrace 20 feet above the river, and partly on the bluffs, which rise 200 feet high. The lower or business portion is regularly laid out and compactly built, and in the upper portion the streets rise picturesquely one above another. Among the prominent buildings are the United States Government Building, the Central Market, St. Raphael's Cathedral (R.C.), and several other important churches.

Business Interests.—The city is the centre of the lead region of Iowa, northwestern Illinois, and southwestern Wisconsin, and contains large zinc works. In 1900 there were 460 manufacturing concerns reported, with a combined capital of \$8,117,358, employing 5,503 persons, paying \$2,012,153 in wages, and yielding products aggregating in value \$10,952,204. The principal manufactures were packed meat, lumber, foundry and machine shop products, malt liquors, bread and bakery products, carriages and wagons, millinery, and clothing. The imports of merchandise at Dubuque in the year ending 30 June 1900 aggregated in value \$40,940. In 1899 there were three national banks, with a combined capital of \$700,000 and a surplus of \$90,000, and several State, savings, and private banks.

Public Interests.—The city is the winter harbor for boats on the Upper Mississippi. In 1893 it was created the see for an archdiocese of the Roman Catholic Church. It is lighted with electricity, has an extensive waterworks system, public library, several hospitals and asylums, electric street railways, and an inclined cable road leading from the river level to the bluffs. Two gunboats for the United States navy have been built here.

Education.—In 1899 there were 18 public day schools, with 5,458 pupils enrolled, of whom 4,185 were in average daily attendance; 126 teachers; and public school property valued at \$360,000. There were over 3,500 pupils enrolled in the private and parish schools. For higher instruction there were a public high school, the academies of St. Joseph, St. Mary, St. Vincent, and the Visitation, and the State Institute of Arts and Sciences.

History.—The city was named in honor of Julien Dubuque, a French trader, who with 10 others settled here in 1788 to mine lead. This was the first settlement in what is now the State of Iowa. The settlement was abandoned after Dubuque's death in 1810, and the site was not again occupied till 1833. This last was the first permanent settlement in Iowa. Pop. (1900) 36,297.

Duc, Joseph Louis, zhō-zěf loo-ē dūk, French architect: b. Paris 25 Oct. 1802; d. 22 Jan. 1879. Winning the Prix de Rome in his 23rd year, in 1840 he was chosen to assist in designing the monument in the Place de la Bastille. His chief work is the Palace of Justice in Paris, which occupied the greater part of 25 years in building, for which the Emperor Napoleon III. gave him \$20,000 as a special prize. The architect devoted the greater part of this sum to establish a prize for excellence in architecture.

For a description of the Palace of Justice see PARIS.

Du Camp, dü kăn, **Maxime**, French writer: b. Paris 8 Feb. 1822; d. Baden-Baden 8 Feb. 1894. He wrote the history of the Paris Commune: 'The Convulsions of Paris' (1878-9), and other historical sketches: 'Egypt, Nubia, Palestine and Syria' (1852); but his greatest work is 'Paris: Its Organs, its Functions, and its Life' (1869-75). He likewise wrote some lyric poems: 'Modern Chants' (1855); 'Convictions' (1858); and several novels, among them: 'Memoirs of a Suicide' (1853); 'The Six Adventures' (1857); 'The Man with the Gold Bracelet' (1862).

Du Cange, dü kănzh, or **Ducange**, **SIEUR Charles du Fresne**, or **Dufresne**, French historian and philologist: b. Amiens 18 Dec. 1620; d. Paris 23 Oct. 1688. His family name was Dufresne, and Sieur Ducange was his title as lord of his paternal estates. He was an alumnus of the college of the Jesuits in his native town and after completing his studies there took up the study of jurisprudence, and in 1631 was admitted to practice as an advocate at the bar of the parliament of Paris. Meeting with discouragement in his profession, he withdrew to his native place and there devoted himself to the historical, linguistic and philological studies which have made him illustrious as a scholar. He was indefatigable in research, and his linguistic attainments, critical acumen and various knowledge enabled him to digest and sort out of the infinite mass of material the facts of history and the points of philology which were necessary for the composition of the many solid memoirs of which he is author. And those works involved titanic labor even if we consider only the work of the pen in making "copy" for the printer; for every word was penned with his own hand. Of the long list of his printed works the two which are most enduringly important—and frequent reference to these is imperative on whosoever studied the history of the Middle Ages at its sources—are his dictionaries of the Greek and Latin languages in the period of their decline. Among other writings may be named 'Histoire de l'empire de Constantinople sous les empereurs français'; 'Historia byzantina duplici commentario illustrata'; 'Chronicon Paschale a mundo condito ad Heraclii imperatoris annum vigesimum.'

Ducange, Victor Henri Joseph Brahain, vĕk-tōr ōn-rē zhō-zěf brā-hăn, French poet and romancer: b. The Hague 24 Nov. 1783; d. Paris 15 Oct. 1833. His first stories, 'Agatha,' and 'Valentine,' were received with great favor; but for his too realistic description in 'Valentine' of the excesses of the Royalist bands, he was sent to jail for six months. Released, he was again imprisoned, ostensibly for vilifying the French Academy. Once more he offended with 'Thelene, or Love and War,' and had to take refuge in Belgium. Other novels are: 'The Confessor Doctor'; 'The Artist and the Soldier,' etc. Of his numerous plays the best and most famed is 'Thirty Years, or the Life of a Gambler.' His novels are vividly dramatic and descriptive.

Ducas, doo-kās, **Michael**, Byzantine historian of the 15th century. He was a descendant from an imperial family, and himself held a high position at the court of Constantine Palæologus, the last emperor of Constantinople. After the

conquest of that city by Mohammed II. he took refuge with the Prince of Lesbos, Dorino Gate-luzzi, and his prudence and skill succeeded in saving the independence of Lesbos for a time. It is probable that he wrote in his old age the history of the Byzantine empire. This begins with an outline of universal chronology, and does not become detailed and truly instructive till the reign of John Palæologus I., and it terminates abruptly in the middle of a sentence, at the capture of Lesbos in 1462. It is the most difficult of all the Byzantine histories, written in a barbarous style, but is judicious and impartial.

Ducat, the name of certain gold or silver coins current in several countries, but is no longer the monetary unit in any country. It had its origin in 1140, and was formerly a favorite coin with the Dutch, and, owing to the excellence of the pieces struck, they were sought for and imitated by several other countries, and especially Russia. Ducats now everywhere circulate at a valuation, where they circulate at all, or are bought and sold simply as bullion. The following are some of the best known:

1. The gold ducat of Holland, weighing 3.494 grammes, .983 fine, value about \$2.33. 2. The gold ducat of Russia, which is of precisely the same weight, fineness, and value as the Dutch ducat. 3. The gold ducat of Austria-Hungary, weighing 3.4904 grammes, .986 fine, value \$2.34. 4. The gold ducat of Sweden, weighing 3.486 grammes, .9766 fine, value \$2.31. 5. The gold ducat of Hamburg, valued at \$1.85. 6. The silver ducat of Sicily, weight 22.943 grammes, .833 fine, value 84 cents. See COIN; NUMISMATICS.

Ducato, Cape. SEE CAPE DUCATO.

Ducatoon, dük-a-toon', or **Ducastone**, formerly a Dutch silver coin worth 3 gulden 3 stivers, or \$1.30. There were coins of the same name in Italy. In Tuscany its value was about \$1.35, in Savoy slightly more, and in Venice about 97 cents.

Duccio di Boninsegna, düch'ō dē bōn-ën-sān'yā, Italian painter, founder of the Siennese school: b. Siena about 1260; d. about 1320. His great work is the altar-piece of the cathedral in Siena, which, when completed was carried in a procession to the cathedral. It shows the Madonna surrounded by saints and angels; on the reverse are 26 pictures of the Passion of Christ. Two other Madonnas in Siena are also attributed to him.

Ducey, Thomas James, American Roman Catholic clergyman: b. Lismore, Ireland, 4 Feb. 1843. He came to the United States when five years old, and after his graduation at the Theological Seminary in Troy, N. Y., was ordained priest in 1868. He founded St. Leo's Church in New York in 1880 and has been its pastor ever since. In 1891 the Pope conferred on him the title of Monsignore. He has been an active champion of labor and reform.

Du Chaillu, dü shā-yü', **Paul Belloni**, American traveler: b. Paris 31 July 1835; d. St. Petersburg, Russia, 30 April 1903. He spent his youth in the French settlement on the Gaboon, on the west coast of Africa, where his father was a merchant, and received his education from the Jesuits there. In 1852 he went to the United States, of which he afterward became a naturalized citizen. In 1855 he began his first journey through western Africa, and spent

till 1859 alone among the different tribes, traveling on foot upward of 8,000 miles. He collected several gorillas, never before hunted, and rarely, if ever, before seen by any European. The result of this journey was his work: 'Explorations and Adventures in Equatorial Africa' (1861). This book contained much important information on the zoology, geography, and ethnology of parts of the continent then unknown to Europeans, and by many authorities Du Chaillu's statements were received with suspicion; but subsequent expeditions by others fully confirmed his substantial accuracy. A second expedition was made by him in 1863, an account of which, under the title 'A Journey to Ashango Land,' appeared in 1867. 'The Land of the Midnight Sun,' an account of a tour in northern Europe (1881), had a considerable success. He has also published a number of books intended for youth, and based on his travels. One of his later works is 'The Viking Age' (1889), a treatise on the ancestors of the English-speaking peoples. In addition to the works named above may be mentioned his 'Stories of the Gorilla Country' (1868); 'Wild Life Under the Equator' (1869); 'Lost in the Jungle' (1869); 'The Country of the Dwarfs' (1872); 'The Land of the Long Night' (1899); 'The World of the Great Forest' (1900); 'How Animals, Birds, Reptiles, and Insects Talk, Think, Work, and Live' (1900).

Duchâtel, dü shā-těl, **Charles Marie Tan-neguy**, COUNT, French economist and politician: b. Paris 19 Feb. 1803; d. there 6 Nov. 1867. Prior to 1830 he took an active part in editing the *Globe*, one of the leading organs of the Liberalists. He began his parliamentary career in 1832, was named secretary-general of the finances in 1833, and in 1835 was appointed to the ministry of commerce. He resigned with his colleagues in February 1836, and now became one of the most energetic leaders of the opposition. At the accession of the cabinet of Soult and Guizot in 1840 he came again into power as minister of the interior, and retained this position with but a short interruption till the revolution of 1848, after which he lived in retirement. The measures supported by him both as deputy and minister were generally of a financial character, but he also took a prominent part in the establishment of railways and telegraphs in France.

Duché, dü-shā', **Jacob**, American Episcopal clergyman: b. Philadelphia 1739; d. there January 1798. In 1759 he was ordained an assistant minister or Christ Church in Philadelphia, of which in 1775 he became rector. He was a man of brilliant talents and impressive eloquence, and at the meeting of the second congress in 1775, just after the outbreak of the War of the Revolution, made the opening prayer. He was for three months chaplain of Congress, but subsequently adopted the Royalist side. Beside several other works he wrote 'Casipina's Letters.'

Duchesne, dü-shān, **André**, French historian: b. Touraine, Isle Bouchard, May 1584; d. 30 May 1640. History and geography were his favorite studies from his youth, and under Richelieu's ministry he was appointed royal geographer and historiographer. His most important works are: 'Histoire d'Angleterre, d'Ecosse et d'Irlande' (1614); 'Histoire des Papes jusqu'à Paul V.' (1616); 'Histoire des rois,

DUCHESS OF DEVONSHIRE — DUCK

'ducs, et comtes de Bourgogne' (1619-28), and his collections of the early Norman and French histories. His industry was extraordinary; he is said to have left more than 100 folios in manuscript. He is frequently styled "The father of French history."

Duchess of Devonshire, English noblewoman, made famous by two beautiful portraits, one by Reynolds and the other by Gainsborough. The latter, the more famous of the two, shows the lady wearing a broad-brimmed hat with plumes, that has come to be known as the Gainsborough hat. The picture is in the gallery of the New British Institution, replaced in 1902, after having been concealed since 1876, when it was cut from the frame by a noted American thief, since dead.

Duchess, The, the pen-name of MARGARET WOLFE HUNGERFORD (q.v.).

Duck, a general name for birds of the family *Anatida*, but more particularly restricted to a group of genera comprising *Anas*, *Spatula*, *Dafila*, *Querquedula*, *Mareca*, *Aix*, *Aythya*, *Fuligula*, *Harelda*, *Somateria*, etc. The ducks proper are distinguished from the swans (*Cyguina*), comprised in the same family, by having shorter necks; and from the geese (*Anserina*), also of the same family, by having shorter necks, and legs less strong and placed farther back. They also subsist largely on insects and other animal food, while the geese and swans live mostly on vegetable food. The voices of the three groups are also distinctive.

The family *Anatida* is the only one of the order *Anseres* and with the flamingoes (*Phenicoptera*) constitutes the *Chenomorpha* (q.v.). The bill is provided with marginal teeth or lamellæ, and is usually broad, flat, and covered with a soft, sensitive skin; the palate is of the desmognathous type, and the occipital region of the skull perforated with usually two fenestræ. With a very few exceptions they are strictly aquatic birds, characteristic of northern regions, where about half of the 180 known species occur. From 5 to 10 sub-families have been recognized by different authors. The simplest arrangement distinguishes the *Cyguina*, or swans; the *Anserina*, or geese; the *Anatina*, or river ducks, with the bill flattened and the hallux unlobed; the *Fuligulina*, or sea ducks, with flattened bill and lobate hallux; and the *Mergina*, or fish-eating ducks, with long, slender, and cylindrical bill, and lobed hallux. Of the last three sub-families, which include all of the ducks, about 40 species belong to the fauna of North America. The following accounts will serve to illustrate the habits and economic importance of some of the most noteworthy.

The mallard, or common wild duck (*Anas boschas*) is found throughout the northern hemisphere, except in the tropics, and breeds throughout the greater part of its range. This is the original stock of the domesticated duck, and appears to have been reclaimed at a very early period. It is found in nearly every fresh-water lake and river of the central United States, northern Europe, and Great Britain. The nest is usually placed by the side of a stream or lake, or in a marsh or bog, among close grass, reeds, and rushes, and may often contain from 12 to 16 eggs, of a dull greenish-white. The flesh of the wild duck is

held in general estimation, and various methods are resorted to in order to obtain these birds in quantities. In Picardy, France, vast numbers are taken in decoys, or ingeniously arranged netted enclosures, and sold in the Paris market, where, in one season, 30,000 francs have been paid for the produce of a single small lake. They also abound in the Fen District, Lincolnshire, England, and formerly were taken in great quantities by similar means as in Picardy. The number taken in England by means of decoys has greatly decreased, however. In the United States various simple contrivances are made use of for the capture of these wary birds. In some ponds frequented by them five or six wooden figures, called decoys, cut and painted to represent ducks, and sunk by pieces of lead nailed to the bottom, so as to float at the usual depth on the surface, are anchored in such a position as to be within easy range of a sportsman concealed among brush, etc. These attract the passing flocks, which alight, and thus expose themselves to certain destruction. In winter, when detached pieces of ice are occasionally floating in the river, some of the sportsmen on the Delaware paint their boats white, and laying themselves flat in the bottom, direct them almost imperceptibly near a flock before the ducks have distinguished them from a floating piece of ice. For this purpose low boats sunk deep in the water and known as sneak boxes are used. On land another stratagem is sometimes practised with great success. A tight hogshhead is sunk in the marsh or mud near the place where ducks are accustomed to feed at low water, and where otherwise there is no shelter; the edges and top are artfully concealed with tufts of long, coarse grass, and reeds or sedge. From within this blind the sportsman watches his collecting prey, and usually commits great havoc. In China the sportsman covers his head with a calabash, pierced with eye-holes, and thus equipped wades into the water, keeping only his head above the surface, and on arriving amid a flock, seizes them by the legs, fastens them to his girdle, and thus takes as many as he wishes, without disturbing the rest.

The black duck (*Anas obscura*) is much more abundant than the mallard in eastern North America, and has a much less extensive north and south range. It breeds in the northern United States and as far north as Labrador. Like the mallard, it is properly a fresh-water duck, but during the late fall and winter frequents the salt marshes and feeds on shell-fish. Great numbers are shot over decoys and from blinds and supplied to the New York and Philadelphia markets. In this species the sexes are similar, while in the mallard the male is larger and much more brightly colored, and is designated the drake, the name duck being restricted to the female.

Musk duck, erroneously called Muscovy duck (*C. moschata*). This well-known bird is the largest of the duck kind, and approaches nearly to the size of a goose. It has obtained its name from a strong smell of musk which exhales from its body, and not because it comes from Russia, as has been supposed, since it is a native of South America. The musk ducks are tamed in great quantities in the West Indies, and are found wild in Guiana, where they nestle on the trunks of trees, close upon the water's edge.

5. Shoveler (*Anas clypeata*).
6. Bernicle Goose (*Branta bernicla*).

DUCK — DUCKBILL

They feed much upon a plant called wild rice, and are difficult to approach.

Canvas-back duck (*Aythya vallisneria*), a delicious duck peculiar to America, was known to the epicure long before it was described by the naturalist. We are indebted to Wilson for the first account of it. He gave it the name of the plant on which it feeds, which had been called after the celebrated Vallisneri. The canvas-back ducks arrive in the United States from their breeding grounds in the north about the middle of October, and, though common throughout the United States, their most famous assembling place is in the numerous rivers in the neighborhood of Chesapeake Bay. On the Susquehanna they are called canvas-backs, on the Potomac white-backs, and on James River shel-drakes. When they first arrive they are very lean; but from the abundance of their favorite food they become fat about November. Formerly they were sometimes found in such multitudes as to cover several acres in a compact flock, but by the use of the swivel gun and night shooting, a practice now prohibited by law, their numbers have been greatly depleted. From the great demand for these ducks and the high price they always command, various methods are employed to decoy them within gunshot. The most successful is that termed tolling, in which they are enticed to approach the shore by means of a dog properly trained. The canvas-back is constantly attended by another species, the American widgeon (*M. americana*), which manages to make a good subsistence from his labors. This bird is extremely fond of the tender roots of that particular species of plant on which the canvas-back feeds. The widgeon, which never dives, watches until the canvas-back rises, and before he has his eyes well opened, snatches the morsel from his mouth, and makes off.

Among other species of ducks are, *Spatula clypeata*, or shoveller, remarkable for the strange form of its bill; *Chaulelasmus strepera*, or gad-wall, which is nearly cosmopolitan but more rare in America than in Europe; *Dafla acuta*, pintail or sprigtail, remarkable for the form of its tail, abundant in both hemispheres; and *Aix sponsa*, summer or wood duck, not more remarkable for its great beauty, in which it stands pre-eminent, than for its habit of nesting in hollow trees. The sub-genus *Nettion* includes the several species of teal, and *Somateria*, the eider ducks. *Oidemia fusca*, velvet duck, found in both hemispheres, has a rank and fishy flavor and is therefore seldom sought after; and *O. americana*, the scoter found in America. These, with a few other birds of the same fishy flavor, are exempted from the interdict which forbids Roman Catholics the use of animal food on certain days, on the supposition of their being cold-blooded and partaking of the nature of fish. *A. americana*, the red-head, and *A. ferina*, the European pochard, approach very near to the canvas-back in appearance and habits. *Fuligula marila*, scaup-duck or blue-bill, is a well-known and common species in both continents. *Clangula hyemalis*, long-tailed duck or old-wife, common to both continents, is remarkable for the long and slender middle feathers of its tail; and *Clangula histrionica*, harlequin-duck, a magnificent species found on both continents, derives its name from the singularity of its markings;

along the coast of New England it is called "the lord."

The duck bred for domestic purposes is derived chiefly from the mallard, crossed in some cases, with either the gadwall, the musk, or the black duck. One of the best-known and most esteemed varieties of domestic duck is the Aylesbury duck, so named from the town in Buckinghamshire, England, where they are largely raised for the London market. They are noted for their size, fine white and downy feathers, and delicately flavored flesh. They are easily raised and very productive, being early layers and accurate hatchers.

Additional information will be found in the articles, canvas-back, dusky duck, eider, gadwall, golden-eye, long-tailed duck, mallard, red-headed duck, ruddy duck, scaup, scoter, shoveller, shel-drake, teal, and widgeon. Consult also: Baird, Brewer, and Ridgway, 'Water-birds of North America'; Salvadori, 'Catalogue of Ducks of the British Museum'; Darwin, 'Animals and Plants Under Domestication'; and Sanford, Bishop, and Van Dyke, 'The Water Fowl Family.'

Duck, a species of strong linen cloth, lighter and finer than canvas, used for small sails and for men's wear. Duck is usually white or unbleached, but is sometimes made in plain colors.

Duck Ant. See WHITE ANT; TERMITE.

Duckbill, or **Platypus**, an aquatic egg-laying mammal (*Ornithorhynchus paradoxus*) native to the sluggish rivers of Australia, Papua, and Tasmania. Its entire length from tip of bill to tip of tail is usually between 18 and 20 inches. Its body is rather long, and covered with glossy blackish hair, close to the roots of which is a soft waterproof under-coat of fur similar to that of the beaver. The head is rounded; the eyes are small and bright; and there are no external ears, despite which fact, the creature's hearing is very acute. The feature which gives its name to the animal is the duck-like bill which is the substitute for the muzzle of other animals. This bill is formed of the elongated jaw-bones, covered with a highly sensitive, smooth skin; when the teeth are shed, as they are at maturity, horny plates, developed on both jaws, take their place and do their work. The duckbill is well adapted to its aquatic and burrowing habits. Its legs are short, its feet webbed and furnished with sharp claws. In the fore-feet the web extends far beyond the claws, but can be folded back out of their way. The tail is broad and flattened, covered with coarse hair, and nearly naked on the other side. In habits the duckbill is almost entirely aquatic, spending its life in or near rivers; but carefully avoiding stagnant or brackish waters. In swimming it propels itself mainly by the aid of its fore-feet; and it dives well. It is gregarious; and sometimes congregates in considerable numbers; but is so shy that unless one watches quietly at evening he will not see a single member of the company. The least hint of danger sends them all to the bottom. The food is often collected in the large cheek pouches, where it can be stored and conveniently carried home by the animal. Each pair lives in a burrow in the bank—a gallery or passageway, widened out at its interior extremity into a chamber where the occupants sleep by day, and whither the

DUCKETT — DUCTILITY

female retires to produce her young. She lays few eggs in her bed of dry grass; often only one, and hatches her young in a comparatively short time. When born they are naked and blind. The eggs are white, about three fourths of an inch long, by one half inch wide; and unlike birds' eggs, have a soft and somewhat flexible shell; though, in their having a large amount of food-yolk, they resemble birds' eggs. The food consists of aquatic insects, crustaceans and worms, which live in the water or in the mud, and which are found not only by the tactile sense, in the bill, but also by the unusually keen sense of smell. The voice is like the growl of an angry puppy, but the disposition is quiet and gentle.

Duck'ett, Sir Floyd, English archæologist: b. 1811; d. 13 May 1902. His 'Technological Military Dictionary' published (1848) in German, English and French, brought him gold medals from Austria, Prussia and France. His 'Reminiscences' appeared in 1894.

Ducking Stool, also known as "cucking stool" and "castigatory," a chair in which common scolds were formerly securely fastened, to receive the punishment of being ducked in water. The culprit was placed in the chair with arms drawn backward; a bar was placed across the back and inside the elbows, while another bar held the body upright; in this uncomfortable position the prisoner was securely tied with cords. The persons appointed to carry out the punishment, by raising their end of the beam, caused the unfortunate culprit to go overhead into the water. By pulling down their end with a chain the victim was once more brought to the surface. The ducking stool was generally used in Great Britain from the 15th to the 18th century, and one case was known as late as 1806.

Duckweed, a genus of plants, by some botanists made the type of the small order *Lemnaceæ*. The species are small plants which float on the surface of stagnant ponds or slow running streams, and are eaten by ducks and geese. The fronds take the place both of the stems and leaves, and are usually of a bright green color. The flowers arise from a slit just below the margin of the frond. The family comprises the very smallest of the flowering plants, and contains three genera, all of which are to be found in North America. Of the 26 species in the family, the most numerous in the United States are those of the genus *Lemna*, of which five are found. The other genera are *Spirodela* and *Wolffia*.

Duckworth, Sir John Thomas, English admiral: b. Leatherhead, Surrey, 28 Feb. 1748; d. Devonport, England, 31 Aug. 1817. Between 1776 and 1779 he served in America. He distinguished himself in 1794 in the great naval victory gained by Lord Howe off Ushant, and in 1798, under Earl St. Vincent, acquired new fame at the capture of Minorca. Some years later he set out in pursuit of a French fleet which had sailed to the West Indies to succor St. Domingo. He came up with it and succeeded in capturing an 80 and three 74 gun ships. For this service he received the thanks of both houses of Parliament, and was presented by the city of London with its freedom and a sword of the value of 200 guineas; and by the assembly of Jamaica with thanks and a sword of the

value of 1,000 guineas. In 1807, having been appointed to watch the Turkish fleet, he forced the passage of the Dardanelles. Between 1810 and 1815 he was governor of Newfoundland.

Duclerc, Charles Théodore Eugene, shārl tā-ō-dōr è-zhān dü-klārk, French statesman: b. Bagnères-de-Bigorre, France, 9 Nov. 1812; d. Paris 21 July 1888. He took an active part in the Revolution of 1848; was a speaker in the Constituent Assembly, and minister of finance for a time. He was elected vice-president of the National Assembly in 1875; chosen a senator for life in the same year; and became premier in 1882.

Duclos, Charles Pinot, shārl pē-nō dü-klō French historian and novelist: b. Dinant, Brittany, 12 Feb. 1704; d. Paris 26 March 1772. He was chosen member of the Academy of Inscriptions in 1739, and in 1747 member of the French Academy, of which he was afterward appointed permanent secretary. In 1750 he was appointed to succeed Voltaire as historiographer of France. Among the best of his novels are 'Confessions du Comte de Bellipse' (1741). His 'Considérations sur les Mœurs de ce Siècle' are full of striking sketches of character and deep knowledge of human nature. His 'History of Louis XI.' is esteemed, but shows the hand of the novelist. Of more value are his 'Mémoires secrets sur les Règnes de Louis XIV. et XV.' This work was composed in his character of historiographer. He also distinguished himself in his 'Remarques sur la Grammaire générale de Port Royal' as a grammarian.

Ducornet, Louis César Joseph, loo-ē sār-zār zhō-zéf dü kōr-nā, French artist: b. Lille 10 Jan. 1806; d. Paris 27 April 1856. Born without arms, he learned in early childhood to use his feet for hands, and when 13 years old showed such skill in drawing with his toes that Watteau received him as a pupil in the Lille Academy of Design. There his ambition to become a painter received wholesome encouragement. At the end of three years he took the first prize for a drawing of the human figure from life, and received a pension from the city which the government subsequently increased. He then went to Paris for more advanced study, painted 'The Parting of Hector and Andromache' (1828), and presented it to his native city. He continued painting till within a few weeks of his death. His last work of note, 'Edith Finding the Body of Harold,' was ordered by Napoleon III. and exhibited in 1855.

Ductilim'eter, an instrument invented by M. Regnier for ascertaining the relative ductility of metals. The metal to be tested is subjected to the action of blows from a mass of iron of given weight attached to a lever, and the effect produced is shown upon a graduated arc.

Ductil'ity, the quality of adaptedness of solid bodies, particularly metals which render them capable of being extended by drawing; as malleability is for being beaten into leaves. The order of metals in these two respects is as follows: ductility—gold, silver, platinum, iron, copper, zinc, tin, lead, and nickel; malleability—gold, silver, copper, tin, platinum, lead, zinc, iron, and nickel. The less ductile soft metals, such as magnesium, which cannot be drawn, are converted into wire by the process of press-

ing or squirting. When glass is subjected to a sufficient degree of heat it can be managed like soft wax, and may be drawn out into threads exceedingly long and fine. Ordinary spinners do not form their threads of silk, flax, or the like, with half the ease and expedition the glass-spinners do threads of this ordinarily brittle matter. Some of them are made into plumes of filaments much finer than hair, which bend and wave, like hair, with every wind. Two workmen are employed in making them: the first holds one end of a piece of glass over a flame, and when the heat has softened it the second operator applies a glass hook and draws out a thread of glass, which still adheres to the mass; then fitting his hook on the circumference of a wheel about $2\frac{1}{2}$ feet in diameter, he turns the wheel as fast as he pleases till it is covered with a skein of glass thread. The parts, as they recede from the flame, by gradually cooling become more cohesive, the parts nearest the fire are least cohesive, and consequently must give way to the effort made to draw them toward the wheel. These threads are commonly of a flat, oval shape, being three or four times as broad as thick; some of them seem scarcely bigger than the thread of a silk-worm, and are surprisingly flexible. If the two ends of such threads are knotted together they may be drawn and bent till the aperture or space in the middle of the knot does not exceed one fourth of a line or one forty-eighth of an inch in diameter. The flexibility of glass increases in proportion to the fineness of the threads; and, probably, had we the art of drawing threads as fine as those of a spider's web, we might weave stuffs and cloths of them.

Duda, Dudka, or Dudotka, the name of a singular wooden wind-instrument used in some parts of Russia, consisting of two tubes of different length, each with three sound-holes and having a single mouth-piece, thus somewhat resembling the double flute of the ancients.

Dude, a modern word coined as a slang expression (but now, by constant use, dignified into semi-respectability) to designate a brainless fop, whose whole business and aim in life are like those of Carlyle's dandy — to wear clothes. The term is said to have originated in London about 1882, at the time of the so-called "aesthetic" movement in dress and manners among the ultra-society folk.

Du Deffand, Madame. See **DEFFAND**.

Dudevant, düd-văn, Madame. See **SAND, GEORGE**.

Dudley, Benjamin Winslow, American surgeon: b. Spottsylvania County, Va., 20 April 1785; d. Lexington, Ky., 20 Jan. 1870. He received his medical education at the medical school of the University of Pennsylvania in Philadelphia, and in 1810 went to Europe for the further study of his profession, where he remained as the pupil of Sir Astley Cooper, Abernethy and others, in London, and Larrey, Dubois, and Boyer till 1814. On his return he established himself in Lexington, Ky., in July 1814, and on the day of commencing practice performed two difficult operations, that for strangulated hernia, and trephining in a case of fractured skull. He became especially noted for his success as a lithotomist.

Dudley, Charles Edward, American politician: b. Johnson Hall, Staffordshire, England, 23 May 1780; d. Albany, N. Y., 23 Jan. 1841. After the death of his father he came with his mother to Newport, R. I., in 1784. In 1811 he removed to Albany. He was State senator 1820-5, mayor of Albany in 1821 and 1823, and in 1829 was appointed United States senator to serve out the unexpired term of Martin Van Buren. He was particularly fond of astronomical science, and his widow in 1856 founded the Dudley Observatory at Albany.

Dudley, Sir Edmund, English politician: b. about 1462; d. London 18 Aug. 1510. He was an instrument of Henry VII. in the arbitrary acts of extortion by the revival of obsolete statutes and other unjust measures practised during the latter years of his reign. On the accession of Henry VIII. he was arrested for high treason and perished on the scaffold with his associate, Sir Richard Empson.

Dudley, Lord Guildford, English noble: d. London 12 Feb. 1554. He was a son of John, Duke of Northumberland, and was married in 1553 to Lady Jane Grey, whose claim to the throne the Duke intended to assert on the death of Edward VI. On the failure of the plot Lord Guildford was condemned to death, but the sentence was not carried into effect till the insurrection of Wyatt induced Mary to order his immediate execution.

Dudley, Sir Henry Bate, English clergyman and author: b. Fenny Compton, Warwickshire, 25 Aug. 1745; d. 1. Feb. 1824. Not finding the emoluments of his curacy sufficient for his convivial tastes, he turned his attention to literature, established several newspapers, among others the *Morning Post* and *Morning Herald*, and also wrote some dramatic works. His original name was Henry Bate, but in accordance with the will of a relative who left him some property, he assumed in 1784 that of Dudley. He was made a baronet in 1812.

Dudley, John, DUKE OF NORTHUMBERLAND and EARL OF WARWICK: b. 1502; d. London 22 Aug. 1553. He was a son of Sir Edmund Dudley (q.v.). Under Edward VI. he manifested the most insatiable ambition and obtained vast accessions of honors, power, and emoluments. The illness of the king, over whom he had gained complete ascendancy, aroused his fears, and he endeavored to strengthen his interest by marrying his son, Lord Guildford Dudley, to Lady Jane Grey, descended from the younger sister of Henry VIII., and persuaded Edward to settle the crown on his kinswoman by will, to the exclusion of the Princesses Mary and Elizabeth. The death of the king, the abortive attempts to place Lady Jane Grey on the throne, and the ruin of all those concerned in the scheme are among the most familiar events in the annals of England.

Dudley, Joseph, American colonial governor of the province: b. 23 Sept. 1647; d. Roxbury 2 April 1720. He was a son of Thomas Dudley (q.v.). He was graduated at Harvard College in 1665, served in the Indian war in 1675, was sent to England as agent for the province in 1682, appointed president of New England in 1686, superseded by Andros a few months later, and made chief justice. He was chief justice of New York from 1690 to 1693,

DUDLEY — DUE PROCESS OF LAW

then eight years lieutenant-governor of the isle of Wight, and finally governor of Massachusetts from 1702 to 1715.

Dudley, Paul, American colonial chief justice: b. 3 Sept. 1675; d. Roxbury, Mass., 21 Jan. 1751. He was a son of Joseph Dudley (q.v.). He was graduated at Harvard College in 1690, and afterward studied law in London. He returned to Massachusetts in 1702, with the commission of attorney-general; in 1718 was appointed judge, and in 1745 became chief justice. By his will he bequeathed £100 to Harvard College, the interest of which was to be applied to the support of an annual lecture. This lecture is called from its founder the Dudleian lecture, and, according to his direction, is delivered on one of four subjects which are treated of in succession.

Dudley, Plimmon Henry, American metallurgical engineer: b. Freedom, Ohio, 21 May 1843. He was chief engineer of Akron, Ohio, 1868-72, and subsequently invented the dynamograph (1874), the track indicator (1880), and the streamatograph for obtaining and registering stresses in rails.

Dudley, Robert, EARL OF LEICESTER, English courtier: b. 24 June 1532 or 1533; d. Cornbury, Oxfordshire, 4 Sept. 1588. He was a son of John Dudley, Duke of Northumberland, and though involved in the criminal designs of his father, and included in the sentence of attainder passed against him on the accession of Mary, was pardoned and employed by that queen. After Elizabeth ascended the throne Dudley soon acquired the distinction of being her favorite. Offices, honors, and wealth were showered on him with an unsparing hand. He was appointed master of the horse, knight of the Garter, and privy counselor; and received grants of the princely domains of Kenilworth, Denbigh, and Chirk Castle. In 1564 he was created Baron Denbigh and Earl of Leicester, and was the same year elected chancellor of Oxford University, having previously been chosen to the same office at Cambridge. In 1588 he was appointed captain-general of the queen's forces to resist the Armada.

Dudley, Thomas, American colonial governor: b. Northampton, England, 1576; d. Roxbury, Mass., 31 July 1652. He came to Massachusetts in 1630 with the commission of deputy governor, and he was afterward chosen governor in the years 1634, 1640, 1645, and 1650. He was a man of integrity and piety, though intolerant, like most of his generation. See Jones, 'Life and Work of Thomas Dudley' (1899).

Dudley, Thomas Underwood, American Protestant Episcopal bishop: b. Richmond, Va., 26 Sept. 1837; d. New York 22 Jan. 1904. He was graduated from the University of Virginia in 1858, and served in the Confederate army during the Civil War, attaining the rank of major. Completing his studies at the Virginia Theological Seminary he was ordained in 1868 and after filling the rectorship of Christ Church, Baltimore, was made assistant bishop of Kentucky in 1875, and became bishop of the diocese 1884. He has published: 'A Wise Discrimination of the Church's Need.'

Dudley, William Lofland, American scientist: b. Covington, Ky., 16 April 1859. He was graduated at the University of Cincinnati in

1880, and from 1880 to 1886 was professor of chemistry and toxicology at Miami College. His iridium process for electroplating is very successful. Since 1886 he has been professor of chemistry at Vanderbilt University, being also dean of the medical department.

Dudley, William Russel, American botanist: b. Guilford, Conn., 1 March 1849. He was graduated at Cornell in 1874, becoming assistant professor of botany there in 1876. Since 1892 he has been professor of botany at Leland Stanford, Jr., University. He is the author of 'Cayuga Flora'; and 'Manual of Histology.'

Dudley, England, city, parliamentary borough in Worcestershire. Among its institutions are a mechanics' institute and a geological society, with a museum rich in mineral specimens, and a free library and school of art. It is situated in the midst of the "black country," with extensive coal fields surrounding it. The principal manufactures are articles made from iron and also flint-glass. There are here the remains of a castle, said to have been founded in the 8th century by a Saxon prince called Dudo or Dud, who has given the town its name. Pop. (of parliamentary borough) 97,000.

Dudley Diamond, The, a diamond found in South Africa in 1868, weighing originally 89 carats, but reduced to half that weight in cutting. It receives its name from its owner, the Earl of Dudley, who bought it for \$150,000. See DIAMOND.

Dudweiler, dood'vī-lér, Germany, town in Rhenish Prussia, about 45 miles northeast of Metz. The coal fields near by are a source of wealth to the town; and the chief manufactures are iron works and potteries. In the vicinity is Brennender Berg (Burning Mountain), a mountain composed largely of coal which has been burning for over 200 years. Pop. 16,514.

Due Process of Law, law in its regular course of administration through courts of justice. This term, due process of law, which occurs in the amendments to the Constitution of the United States (Art. V.), and in the constitutions of nearly all of the States, is considered by Coke as equivalent to the phrase "law of the land" (used in Magna Charta, ch. 29), and is said by him to denote "indictment or presentment of good and lawful men." Coke Inst. 50. Due process of law includes notice, hearing, and judgment. The constitutions of the various States and the Federal Constitution contain no description of those processes which it was intended to allow or forbid. As a general rule they do not even declare what principles are to be applied to ascertain whether it be due process. It is manifest that it was not left to the legislative power to enact any process which might be devised. As used in the Constitution of the United States, the article is a restraint on the legislative as well as on the executive and judicial powers of the government, and cannot be so construed as to leave Congress free to make any process, "due process of law," by its mere will. It has been held that the amendment to the Constitution of the United States does nothing more than declare a great common law principle applicable to all governments, both State and Federal, which has existed from the time of Magna Charta. It was held by the Supreme Court of the United States in *Murray v. Hoboken Co.*, 18 How. 272,

DUEL

that the words "due process of law" were undoubtedly intended to convey the same meaning as the words "law of the land" in Magna Charta. Due process of law ordinarily implies and includes a complainant, a defendant and a judge, regular allegations, an opportunity to answer, and a trial according to some settled course of judicial proceeding. When applied to proceedings in criminal cases, the expression "due process of law," or the "law of the land," means that no person shall be deprived of life, liberty, property, or privileges, without indictment or presentment by "good and lawful men," selected, organized, and qualified in accordance with some pre-existing law, and a trial by a court of justice, according to the regular and established course of judicial proceedings. It is to be regretted, however, that the constitutional meaning or value of the phrase "due process of law" remains to-day without that satisfactory precision of definition which judicial decisions have given to nearly all the guarantees of personal rights found in the constitutions of the several States and of the United States.

Duel (from *duellum*, derived from *duo*) is a combat between two, at a time and place appointed in consequence of a challenge, and so is distinguished from an encounter taking place without any previous arrangement. The custom of dueling was derived from the Germans, Danes, and Franks, who carried the practice of the judicial combat so far that none were excused except women, sick people, cripples, and such as were over 60 years of age. Even ecclesiastics and monks were obliged to maintain their controversies by a champion in arms; and this singular species of jurisprudence was not confined to criminal accusations, but the titles to estates were decided in the same manner. At length, however, this mode of trial was limited to those accusations of capital offenses in which there was no other testimony, and in which common fame pronounced the accused party to be guilty. The party vanquished was punished by hanging, beheading, or mutilation of members. A judicial combat was authorized by Gundebald, king of the Burgundians, as early as 501 A.D. The practice of trying rights to land, as well as the guilt or innocence of an accused party, by combat under judicial authority, very naturally suggested the decision of personal quarrels in the same way, and all cases in which there was no adequate redress provided in the ordinary tribunals.

The example of Francis I. of France and Charles V. of Spain gave a sanction to this mode of arbitration. On the breaking up of the treaty between these sovereigns and the declaration of war by the French and English heralds at the court of Charles, 2 Jan. 1528, the emperor, in replying to the declaration of the French monarch, desired the herald to acquaint his sovereign that he would henceforth consider him not only as a base violator of public faith, but as a stranger to the honor and integrity becoming a gentleman. On receiving this message Francis immediately sent back the herald with a cartel of defiance, gave the emperor the lie in form, challenged him to single combat, and required him to appoint the time, place, and weapons. Charles accepted the challenge; but after many messages concerning the arrangements for the combat, accompanied with mutual reproaches bordering on the most indecent scurrility, all

thoughts of the duel were given up. But this affair, though it thus terminated without any rencounter, is supposed to have had a great influence in producing an important change in manners all over Europe. Upon every insult or injury which seemed to touch his honor a gentleman thought himself entitled to draw his sword, and to call on his adversary to give him satisfaction. Dueling raged with the greatest violence in France, where it is calculated that 6,000 persons fell in duels during 10 years of the reign of Henry IV. His celebrated minister, Sully, remonstrated against the practice; but the king connived at it, supposing that it tended to maintain a military spirit among his people. But afterward, in 1602, he issued a very severe decree against it, and declared it to be punishable with death; and at the same time commanded any person who had suffered wrong or received an insult to submit his case to the governor of the province, in order that it might be considered by a tribunal consisting of the constables and marshals of France. This decree, however, accompanied by the institution of a tribunal of honor, did not put an end to duels in France. Richelieu was firm in carrying out all edicts by which he hoped to check the power of the nobility, and accordingly insisted on the strict observance of those against duels. Under his ministry the Count of Bouteville-Montmorency suffered death in 1627 for having violated a decree of the French parliament against dueling. This had for a time the effect of deterring others from engaging in this practice. During the minority of Louis XIV. the law was more feebly administered, and more than 4,000 nobles are said to have lost their lives in duels. With the revolution of 1789 commenced the period of legal impunity for duels, and a new class of duels became common, those, namely, between men engaged in politics. Bills, with a view to put down the practice, were brought forward in the chambers in 1829 and 1830, and a similar proposal was made to the Council of State in 1832; but they were not accepted. At last, in 1837, the court of cassation determined to follow a new law with regard to duels, and protesting against the practice in the name of morality and law, it decided that in case of death or injury resulting from a duel, the principal parties and the seconds should be proceeded against and punished in accordance with the general provisions of the *code pénal*. The French courts, however, reserve to themselves a discretionary power in dealing with cases of dueling, and the practice is by no means yet obsolete in France.

Single combats are said to have been introduced into England by the Normans. In the time of chivalry numerous single combats took place in England, which, in the proper sense of the term, can scarcely be called duels. It may be said that the duel, strictly so called, was introduced into England about the same time that it became common in France, such was the contagion of the example of Francis I. and Charles V. In the reign of James I. of England there were numerous cases of dueling, the most celebrated of which is that in which Lord Bruce and Lord Sackville (afterward Lord Dorset) were the principals, and in which the former was killed. Cromwell was an enemy of the duel, and during the protectorate there was a cessation of the practice. It came again into vogue, however, after the Restoration, thanks

chiefly to the French ideas that then inundated the court of St. James. Some of the duels of that epoch are in perfect accord with the loose morality then prevalent. An instance of this is the duel in which the Duke of Buckingham killed the Earl of Shrewsbury, while the wife of the latter, the cause of the duel, who had accompanied the Duke to the ground, witnessed the encounter in the dress of a page. A striking thing is that as society became more polished in England, duels became more frequent. They were never more numerous than in the reign of George III. Among the principals in the fatal duels of this period were Charles James Fox, Sheridan, Pitt, Canning, Castlereagh, the Duke of York, the Duke of Richmond, and Lord Camelford. The last-mentioned was the most notorious duelist of his time, and was himself killed in a duel in 1804. Of all the duels which took place during the reigns of George IV., William IV., and Queen Victoria, the most celebrated is that which was fought between the Duke of Wellington and Lord Winchelsea in 1829, the cause of which was certain animadversions which Lord Winchelsea had passed on the Duke's conduct in connection with the Catholic Emancipation Bill. The duel passed off without any injury being done to either of the parties engaged. The Duke of Wellington missed his aim, whereupon Lord Winchelsea fired into the air and apologized. Since that time the practice may almost be said to have become extinct in England. Even in the army dueling is now rare, since the offense is now one for which any person concerned in it may be tried by court-martial.

In Germany the practice of dueling is not yet extinct. Indeed in the army it is recognized by law as having a certain defined position. It is still also not uncommon at the German universities, though the duels of the students are seldom serious affairs, being rather fencing matches with sharp weapons than duels proper. The combatants are generally padded all over the body except the face and sword-arm.

Dueling has been known in the United States from the very beginning of their settlement, the first duel taking place in 1621, at Plymouth, between two serving men. In 1728, a young man named Woodbridge was killed in a duel on Boston Common, by another young man named Phillips. They fought without seconds, in the night time, and with swords. Aided by some of his friends, Phillips got on board a man-of-war and escaped to France, where he died a year afterward. There were few duels in the Revolution, the most noted being those between Gen. C. Lee and Col. John Laurens, in which the former was wounded, and between Gens. Cadwallader and Conway, in 1778, in which the latter received a shot in the head from which he recovered. Button Gwinnett, one of the signers of the Declaration of Independence, from Georgia, was killed in a duel with Gen. McIntosh, in May 1777. In 1785 Capt. Gunn challenged Gen. Greene twice, both being citizens of Georgia, and threatened a personal assault when the latter refused to meet him. Greene wrote to Washington, acknowledging that if he thought his honor or reputation would suffer from his refusal he would accept the challenge. He was especially concerned as to the effect of his conduct on the minds of military men, and admitted his regard for the opinion of the world. Wash-

ington approved of his course in the most decisive terms, not on moral grounds, but because a commanding officer is not amenable to private calls for the discharge of his public duty.

Alexander Hamilton was killed in a duel with Aaron Burr in 1804, the latter being Vice-President, and the former the greatest leader of the opposition. This duel is always allowed the first place in the history of American private combats. That which stands next is the duel between Capts. Barron and Decatur, the latter being killed, and Barron severely wounded. Henry Clay and John Randolph fought in 1826, and Col. Benton, in closing his account of the fight, says: "Certainly dueling is bad, and has been put down, but not quite so bad as its substitute—revolvers, bowie knives, blackguarding, and street assassinations under the pretext of self-defense." Gen. Jackson killed M. Dickinson in a duel, and was engaged in other "affairs." Col. Benton killed a Mr. Lucas, and had other duels. In 1841 Mr. Clay was on the eve of fighting with Col. King, then a senator from Alabama, and elected Vice-President in 1852. Mr. Cilley of Maine fought with Mr. Graves of Kentucky in 1838, near Washington, and the former was killed. This duel caused nearly as much excitement as that between Hamilton and Burr. Both parties were members of Congress. Duels have been numerous in California, notably the combat between Terry and Broderick. Formerly they were very common in the United States navy, and valuable lives were lost. It is related of Richard Somers, who perished in the *Intrepid*, and who is said to have been a mild man, that he fought three duels in one day. In 1830 President Jackson caused the names of four officers to be struck from the navy roll because they had been engaged in a duel. Since the Civil War stringent laws have been passed in all the States against dueling and the practice has become obsolete in this country.

Bibliography.—Douglas, 'Duelling Days in the Army' (1887); Massi, 'History of Duelling in All Countries' (1880); Milligen, 'History of Duelling' (1841); Steinmetz, 'The Romance of Duelling' (1868); Truman, 'The Field of Honor' (1884).

Duer, dü'ér, John, American jurist: b. Albany, N. Y., 7 Oct. 1782; d. Staten Island 8 Aug. 1858. He commenced the practice of law in Orange County, N. Y., whence about 1820 he removed to the city of New York, where he resided until his death. In 1825 he was appointed one of the commissioners to revise the statute law of the State, and in 1849 was elected a justice of the superior court of New York, a position which he filled until his death. He published: 'Lecture on the Law of Representations in Marine Insurance' (1845); 'Law and Practice of Marine Insurance' (2 vols. 8vo, 1845-6), which has become a standard authority in the United States.

Duer, William Alexander, American jurist: b. Rhinebeck, Dutchess County, N. Y., 8 Sept. 1780; d. New York 31 May 1858. He was a brother of John Duer (q.v.). He was admitted to the bar in 1802, and between 1814 and 1820 was a member of the State assembly, taking a prominent part in the debates on the establishment of canals and other important questions. In 1822 he was appointed judge of the supreme court in the third circuit, an office which he held

until the close of 1829, when he was elected president of Columbia College. He retired from this post in 1842. He was the author of a treatise on the 'Constitutional Jurisprudence of the United States.'

Duero. See DOURO.

Duez, Ernest, ér nā dü-a, French painter: b. Paris 8 March 1843; d. there 5 April 1896. He was a pupil of Pils, and his paintings include: 'The Honeymoon'; 'Splendor and Misery'; 'St. Cuthbert'; 'Evening in Villerville'; 'The Pont-Neuf'; and 'In Summer.'

Dufaure, Jules Armand Stanislas, zhül är-män stän-ê-lä dü-för, French orator and statesman: b. Saujon, France, 4 Dec. 1798; d. Paris 28 June 1881. He practised law at Bordeaux; entered the Chamber of Deputies in 1834, and became an influential leader of the Liberal party. Under the republic he was minister of the interior, but was driven from the public service by the *coup d'état* of 1851, and for the next 20 years devoted himself closely to his bar practice and pamphlet writing. Under the government of Thiers he acted as minister of justice; and in 1876, and again from 1877 to 1879, he was head of the cabinet.

Duff, Alexander, Scottish missionary: b. Perthshire 26 April 1806; d. Edinburgh 12 Feb. 1878. He set out in 1829 for India as the first Church of Scotland missionary to that country. He opened a school in Calcutta in which he sought to teach not only the doctrines of Christianity, but also the English language and the science and learning of Europe. He subsequently assisted in founding the University of Calcutta. His chief writings are: 'The Church of Scotland's India Mission' (1835); 'Vindication of the Church of Scotland's India Mission' (1837); 'India and India Missions' (1840); 'The Jesuits' (1845); 'The Indian Mutiny: Its Causes and Results' (1858).

Duff, Edward Gordon, English librarian: b. 16 Feb. 1863. He was educated at Cheltenham College and Oxford, and was librarian of the John Rylands Library, Manchester, 1893-1900. He was Sanders reader in bibliography in Cambridge University 1898-9, and 1902-3. He has published: 'Early Printed Books' (1893); 'Early English Printing' (1896); 'The Printers, Stationers, and Bookbinders of London' (1899); 'William Caxton' (1902).

Duff, Mary Ann Dyke, actress: b. London, England, 1794; d. New York 1857. She made her first appearance at the age of 14, and two years later, having married an actor named Duff, in the meantime, came to America, appearing as Juliet in Boston. With the exception of a short visit to England in 1828, the rest of her career was in America, where she appeared with the leading actors of the day in the tragedy roles of the stage. The elder Booth declared her to be the best actress in the world. Her last public appearance was in New Orleans in 1838. She married a Mr. Seaver of New Orleans, and spent nearly 20 years in retirement.

Duff, Sir Mountstuart Elphinstone Grant, English writer and politician: b. Eden, Aberdeenshire, 21 Feb. 1829. He was educated at Balliol College, Oxford, was called to the bar at the Inner Temple in 1854, and in 1857 entered the House of Commons. From 1868 till 1874 he held the

office of under-secretary for India under Mr. Gladstone, and in that statesman's second ministry he was under-secretary for the colonies from 1880 till his appointment in 1881 as governor of Madras. His tenure of this important office was very successful, and ended with his resignation in 1886. From 1889 till 1893 he was president of the Royal Geographical Society. His published works include: 'Studies in European Politics' (1866); 'A Political Survey' (1868); 'Elgin Speeches' (1871); 'Notes of an Indian Journey' (1876); 'Miscellanies, Political and Literary' (1879); 'Memoir of Sir Henry Sumner Maine' (1892); 'Ernest Renan' (1893); and 'Notes from a Diary' (1897-8-9-1900).

Dufferin (dŭf'ér-in) and Ava, ä'va, Frederick Temple Hamilton-Temple Blackwood, MARQUIS OF, Irish diplomatist and author: b. Ireland 21 June 1826; d. Clanboye, Ireland, 12 Feb. 1902. He first distinguished himself by contributions to literature, and published the popular 'Letters from High Latitudes' in 1859. He was successively under-secretary for India 1864-6, and for war 1866; was chancellor of the Duchy of Lancaster 1868-72; in 1871 was created an earl; and was governor-general of Canada 1872-8. His brilliant administration was remarkable for the wonderful development of the province of Manitoba. From 1879 to 1881 he was ambassador at St. Petersburg, whence he was transferred to Constantinople. In 1884 he succeeded Lord Ripon as viceroy of India, resigning in 1888. Lord Dufferin's tenure of office was made memorable by measures for strengthening the Indian frontier; by the various attempts to delimit the Afghan frontier; and, above, all, by the annexation of Upper Burma in December 1885. He became successively ambassador at Rome, marquis (1888), and ambassador to France (1891). In addition to the volume named he published: 'Irish Emigration and the Tenure of Land in Ireland' (1867); 'Speeches and Addresses' (1882); 'Speeches Delivered in India' (1890). His mother, Helen Selina Sheridan (1807-67) was the author of 'The Emigrant's Farewell'; 'O Bay of Dublin'; and other touching songs.

Duffield, George, American Presbyterian clergyman: b. Strasburg, Pa., 4 July 1794; d. Detroit, Mich., 26 June 1869. He held prominent Presbyterian pastorates in Philadelphia, New York, and Detroit, and was active as a leader of the "New School" Presbyterians.

Duffield, George, American Presbyterian clergyman and hymn writer: b. Carlisle, Pa., 12 Sept. 1818; d. Bloomfield, N. J., 6 July 1888. He was a son of the preceding. He was graduated at Yale in 1837, and at Union Theological Seminary, N. Y., in 1840. He held various Presbyterian pastorates, and wrote the popular hymns 'Blest Saviour, Thee I Love' (1851); and 'Stand Up, Stand Up for Jesus' (1858).

Duffield, John Thomas, American mathematician: b. McConnellsburg, Pa., 19 Feb. 1823; d. Princeton, N. J., 10 April 1901. He was graduated at Princeton in 1841, and at the Theological Seminary there in 1844. At that college he was successively tutor in Greek 1845, adjunct professor of mathematics 1847, and professor of mathematics in 1856, which last post he held for several years. Among his scientific writings are: 'The Discovery of Gravitation'; 'The Philosophy of Mathematics' (1867).

Duffield, Samuel Augustus Willoughby, American Presbyterian clergyman and poet: b. Brooklyn, N. Y., 24 Sept. 1843; d. Bloomfield, N. J., 12 May 1887. He was graduated at Yale in 1863, and from 1882 till his death preached at Bloomfield, N. J. Among his writings are: 'English Hymns, Their Authors and History' (1886); 'Latin Hymn-writers and Their Hymns' (1889).

Duffield, William Ward, American civil engineer: b. Carlisle, Pa., 19 Nov. 1823. He was graduated at Columbia in 1841 and served as lieutenant on the staff of Gen. Pillow in the Mexican war 1847-8, and during the Civil War commanded the 4th Michigan Infantry. He was breveted major-general in 1863; elected State senator for Michigan in 1878, and appointed chief engineer for railways in Michigan, New York, Illinois, Texas, and United States engineer of improvements on Wabash and White rivers in 1892. His writings include 'School of the Brigade, and Evolutions of the Line'; 'Treatise on Logarithms.'

Duffy, Sir Charles Gavan, Australian statesman: b. Monaghan, Ireland, 12 April 1816; d. Nice, France, 9 Feb. 1903. He took to journalism, and in 1842 assisted in founding a Dublin newspaper called the 'Nation.' In 1843 he was convicted of sedition with O'Connell, but the House of Lords in the following year quashed the conviction. He played a prominent part in the founding and directing of the Irish Confederation, and in 1848 he was brought to trial along with other members of that body on a charge of treason-felony, but the prosecution could not obtain a conviction. In 1852 he was elected to Parliament as representative of New Ross, and succeeded in forming an independent Irish political party. Dissensions arose and in consequence he resigned his seat and went to Australia in 1856. For some time he practised as a barrister in Melbourne. In 1857 he became minister of public works in the first responsible Victorian government. In 1858, and again in 1862, he was minister of lands, and became premier of Victoria in 1871. In 1880 he returned to Europe. Several works from his pen have been published, including: 'The Ballad Poetry of Ireland' (1845, about 50 editions); 'Young Ireland: a Fragment of Irish History 1840-50' (1880); 'Four Years of Irish History 1845-9' (1883), a sequel to the preceding work.

Dufrenite, dü'frēn-īt, a native basic phosphate of iron. It occurs in small crystals of orthorhombic form; but usually it is in radiating-fibrous masses, sometimes with botryoidal or drusy surface. Its hardness is 3.5 to 4, and specific gravity about 3.3. It is nearly opaque, has a silky lustre and a blackish-green color. It is found in Westphalia, Bohemia, France, and in Cornwall, England. In the United States it occurs as a fibrous coating in the green sand formation at Allentown, N. J., also in fine radiating masses in Rockbridge County, Virginia. Named in honor of the French mineralogist, Dufrenoy.

Dufrenoy, Pierre Armand, pē-ār ār-mān dü-frā-nwā, French geologist and mineralogist: b. Sevrans, Seine-et-Oise, 5 Sept. 1792; d. Paris 20 March 1857. In 1841 he published a great geological map of France with three volumes of text, and this was followed by his 'Treatise on Mineralogy.' He introduced a new classification of minerals, based on crystallography.

Dufrenoyite, dü-frē-noi'zīt, an orthorhombic, opaque, brittle mineral of metallic lustre and blackish lead-gray color, named for the French mineralogist Dufrenoy. Hardness, 3; specific gravity, about 5.56. Composition: Sulphur 22.10, arsenic 20.72, lead 57.18=100. Found in Switzerland.

Dufresne, Charles, shārl dü-frān. See DU CANGE.

Dufresny, Charles Rivière, shārl rē-vē-ār dü-frā-nē, French poet: b. Paris 1654; d. there 6 Oct. 1724. He was appointed manager of the royal gardens, on account of the strong love of flowers which he manifested, and in this capacity introduced into France the taste for gardens in the English style. Among his dramatic pieces may be mentioned: 'L'Esprit de Contradiction,' a one-act play in prose; 'Le Mariage fait et rompu,' in verse; and a second prose piece in three acts, called 'Le Double Veuvage.' He also wrote a romance in which he depicts the manners of the time after the fashion of Le Sage, 'Les Amusements sérieux et comiques.'

Duganne, dü-gān', Augustine Joseph Hickey, American poet and novelist: b. Boston 1823; d. New York 20 Oct. 1884. He wrote many novelettes and romances, and a great number of miscellaneous papers under various signatures. His principal poetical works are: 'The Iron Harp,' and 'Parnassus in Pillory.' Among his other writings are a 'Comprehensive Summary of General Philosophy' (1845); and 'Class Book of Governments and Civil Society' (New York 1859).

Dugdale, Sir William, English antiquary: b. Shustoke, Warwickshire, 12 Sept. 1605; d. there 10 Feb. 1686. He was, in 1640, made *rouge croix poursuivant*, and had apartments in the heralds' office, with ample opportunities for his favorite study. With Dodsworth he prepared the 'Monasticon Anglicanum' (1655-73). The principal work of which Dugdale had the sole merit is the 'Antiquities of Warwickshire' (1656). At the Restoration he was appointed Norroy king-at-arms, and in 1677 Garter king-at-arms, with the honor of knighthood. Besides the works already mentioned, he published the 'Baronage or Peerage of England' (1675-6); 'Origines Judiciales, or Historical Memoirs of the English Law Courts of Justice, etc.' (1666); a 'History of St. Paul's Cathedral' (1658); and various minor writings.

Dugmore, Arthur Radclyffe, American artist and author: b. England 25 Dec. 1870. He studied painting at the Belle Arti, Naples; came to the United States in 1889, and has devoted himself to the study of ornithology, drawing, painting, and illustrating by photography. He has published: 'Bird Homes'; 'Habits of the Land Birds Breeding in the Eastern United States' (1900); 'Nature and the Camera' (1902).

Dugong, dü'gōng, or Duyong, the Malayan name for the genus *Halicornes* of the order *Sirenia* or 'sea cows.' It is from five to seven feet long, occasional specimens attaining a length of nine feet. It is a marine animal, never ascending rivers, and feeds chiefly on seaweed; in which particular it differs from the related genus *Manatus*. It is found along the shores of Australia, of the Indian Ocean, and around the Red Sea. Unlike the manatee it has a crescent-shaped tail, its nostrils are on the upper part of the muzzle,

and its flippers are quite without trace of nails. The skull of the dugong is characterized by the thickness of the beak and the lower jaw, both of which are bent sharply downward, almost at right angles to the axis of the skull. In the males, the incisors are developed into large, straight tusks, pointing directly downward. In color the animal is grayish-blue sometimes whitish below. The female is proverbial among the Malays for her maternal solicitude for her offspring, of which but one is produced at a birth.

The flesh of the dugong is said to be extremely palatable; but its chief value, from a commercial standpoint, is the fine oil yielded by the Australian species (*Halicore australis*). This has been in such demand for medicinal and other purposes, as to have caused a wholesale slaughter amounting almost to the extermination of the species. See SIRENIA for structure.

Dug'out, a cave dug in the side of a hill or mountain, used as a dwelling, partly built of logs as seen in some sections of Montana, or as a place of refuge from cyclones and tornadoes. These are frequently to be seen in some of the western States. Also the name of a canoe or boat made from a log of wood, hollowed and shaped for use.

Duguay-Trouin, René, rê-nâ dü-gâ-troo-ân, French seaman: b. St. Malo 10 June 1673; d. Paris 27 Sept. 1736. His various successful privateering expeditions attracted the attention of the government before he was 21, and Louis XIV. sent him a sword. He captured great numbers of English and Dutch ships on the coast of Spain and Ireland; in 1696 he took a great part of the outward-bound Dutch fleet under Wassenaar; in 1697 he entered the royal marine as a captain. He signalized himself so much in the Spanish war that the king granted him letters of nobility, in which it was stated that he had captured more than 300 merchant ships and 20 ships of war. By the capture of Rio de Janeiro (1711) he brought the crown more than 25,000,000 francs. Under Louis XV. he rendered important services in the Levant and the Mediterranean.

Du Guesclin, Bertrand, bër-trân dü gâ-klân, constable of France: b. Motte-Broon castle, near Rennes, 1320; d. 13 July 1380. Mainly to him must be attributed the expulsion of the English from Normandy, Guienne, and Poitou. He was captured by Chandos at the battle of Auray in 1364, and ransomed for 100,000 francs. While serving in Spain against Peter the Cruel he was made prisoner by the English Black Prince, but was soon liberated. For his services in Spain he was made constable of Castile, count of Trastamare, and Duke of Molinas; and in 1370 he was made constable of France. See Luce, 'Histoire de Bertrand du Guesclin et de son époque' (1876); Stoddard, 'Bertrand Du Guesclin' (1897).

Duhamel, William, American physician: b. Maryland 1827; d. Washington, D. C., 15 Aug. 1883. He was graduated at the Maryland University of Medicine 1849; appointed adjunct professor of surgery in the Georgetown Medical College 1852; attended all the occupants of the White House during three presidential terms and was chief physician to the United States prisons in the District of Columbia 10 years.

Dühring, Eugen Karl, oi-gân kârl dü'ring, German philosophical writer: b. Berlin 12 Jan. 1833. He studied at the University of Berlin, and practised law for a time; he then became professor of philosophy and political economy at Berlin in 1864, but gave up the position on account of quarrels with the faculty. He has written: 'Der Wert des Lebens' (1865), which did much to introduce the positivism of Comte into Germany; 'Kritische Geschichte der Philosophie' (1869); 'Logik und Wissenschaftstheorie' (1878); 'Die Judenfrage als Rassen-, Sitten-, und Kulturfrage' (1892); also a number of works in political economy, including 'Kapital und Arbeit' (1865); 'Die Verkleinerer Careys' (1867); and 'Kritische Geschichte der Nationalökonomie und des Sozialismus' (1879).

Duhring, Julia, American essayist: b. Philadelphia 23 Feb. 1836. She has been an extensive traveler in the United States, Europe, Asia, and Africa; and has published several volumes of critical essays on social life: 'Philosophers and Fools' (1874); 'Gentlefolks and Others'; 'Amor in Society'; 'Mental Life and Culture.'

Duiker-bok, dī'kér- or doi'ker-bök, a genus of small antelopes (*Cephalolophus*), native to southern Africa. They are characterized by small, straight horns, generally present in both sexes; and by an upright tuft of hair between the horns. The typical species (*C. grimmi*) is found in bush-covered districts from the Cape of Good Hope to the Zambesi River, and ranges even farther north along the west coast of Africa. It stands about 26 inches high; its ears are long and narrow; its color is yellowish-brown, with a tendency to gray; but the color is decidedly variable. The horns, in this species present only in the male, are from three to five inches long, and rise at a sharp angle to the face. Of the allied species the following are the most important ones: The redbuck of Natal (*C. natalensis*), which differs from *C. grimmi* in that its horns incline backward, and are present in both sexes; and that its color inclines more to the reddish tint. The bluebuck of the jungle (*C. monticola*) is a tiny creature, only 13 inches high at the shoulder, that swarms in the Natal region. It is smaller and lighter in build than a hare; is bluish mouse-color, and has tiny straight horns. It feeds on berries and young shrubs. The zebra-antelope of West Africa (*C. doriae*) is distinguished by its coat of rich golden-brown, banded with eight or nine transverse lines across the back and loins. The wood antelopes, also West African, are nearly three feet tall, and are classed in two species, *C. sylvicultor* and *C. jentinki*.

The name "duiker" signifies "ducker" or "diver," in allusion to the animal's rapidity of motion when in the thickets. Consult: Schweinfurth, 'Heart of Africa' (Leipsic 1878); and other books by African explorers and naturalists.

Duil'ius, Gaius, Roman general: b. about 300 B.C. He was trained to arms by his father Marcus, and rose to the highest rank as a naval and military officer. He became consul in 260 B.C., defeating the Carthaginians near Mylae in that year. In honor of this victory, Rome's first success on the sea, a magnificent column (columna rostrata) was erected.

DUISBURG—DUKE

Duisburg, doo'is-boorg, Germany, city, an inland port of Prussia, in the Rhine province, about 13 miles north of Düsseldorf. The town has civic, educational, and other institutions in keeping with its importance. The finest of the churches is the 14th century Saint Salvator, with fine wall-paintings. Duisburg has blast-furnaces, foundries, and other works depending on the iron trade. Its chemical works, cotton-mills, and commerce are extensive. It is an ancient place, early rose to be a free town, and became a member of the Hanseatic league. It possessed a university from 1655 to 1818. The tomb of Mercator, the famous geographer, is here. Pop. (1900) 93,605.

Dujardin, Félix, fā-lēks dū-zhār-dān, French naturalist: b. Tours 5 April 1801; d. Rennes 8 April 1860. From 1827 to 1834 he delivered public lectures in Tours upon geometry and chemistry as applied to the arts. During the same period he published several geological works, in one of which he first made known the curious fact that artesian wells bring to the surface seeds and remains of insects, which have been taken from long distances and transported through subterranean passages. In 1833 and 1834 he published descriptions of the flora of the region of the Loire, and of the geology and fossils of Touraine. He then devoted himself to zoological researches, and published observations upon the *rhizopoda*, for which he proposed a new classification. In 1839 he added extended annotations to the 3d volume of De Lamarck's 'History of Invertebrate Animals,' and among his later publications were his researches upon the brain of insects, and upon the instinct of bees. He was a professor at Rennes from 1839.

Dujardin, Karel, Dutch artist: b. Amsterdam 1640; d. Venice 20 Nov. 1678. He went to Italy when young, and was a member of the Society of Painters at Rome, among whom he was called BARBA DI BECCO. His works met with general approbation. His landscapes have spirit and harmony, his figures expression, and his color the brilliancy which distinguishes his school. His paintings are rare, and command a high price. He also published 52 landscapes etched with much spirit and ease.

Duk-Duk, in New Pommern (formerly New Britain,—the largest island of the Bismarck archipelago in the Pacific Ocean,—is a secret male society for the preservation of ancient observances among the Melanesian natives. The inculcation of respect and order among the youthful members of the community, the subjection of women, and the enforcement of obedience to the chiefs are among its main objects; its mystic ceremonies, masked dances, etc., are picturesque. The society is analogous to the West African negritral Mumbo Jumbo organizations, and is interesting sociologically as an uncivilized form of the *Vehmgericht*, lodges, bachelors' clubs, etc., of Europe and America. Consult: Powell, 'Three Years Among the Cannibals of New Britain' (1897).

Duke (in French *duc*, in Spanish *duque*, in Italian *duca*, in Venetian *doge*, all derived from the Latin *dux*, leader, commander), a title belonging originally to a military leader. The title seems to have come into use when Constantine separated the military and civil commands of the provinces; the title *dux* was then applied

to the military governor of a province, and the ducal rank was made inferior to that of the *comes* (count). The Goths, Franks, and other northern tribes who invaded the vast Roman territories, adopted, if they had not before borrowed, the titles of duke and count. Among those warlike peoples, however, the dukes, as military chiefs, soon acquired a marked pre-eminence over the counts, whose functions in the eastern and western empires were more of a civil and judicial nature. Under Charlemagne, who was jealous of the increasing power of the higher nobility, the dignity was suffered to cease, but under his weaker successors the ducal governors of the provinces attained an almost absolute independence. The concession of hereditary power and independent jurisdiction, first to the central province known as the Isle de France, and then to Aquitaine, extended itself under the Carolingians to Burgundy, Normandy, and Gascony, and on the accession of Hugh Capet to all the other subaltern tenures. It was not long until the dukes, feeling secure in the unlimited governing power of their provinces, proclaimed their title to be as good as that of the king. They coined money, assumed the crown and sceptre, gave law to their subjects, made war even against the king, and reduced the royal jurisdiction to a few towns such as Rheims and Laon. From the time of Philip II. (Philippe Auguste) to that of Louis XI., however, these duchies were gradually reunited to the crown, and those subsequently accorded to the members of the royal family enjoyed none of the privileges of independent sovereignty. Prior to the Revolution dukes were created by letters patent of the king, and were of three kinds, and those designated as dukes and peers held the first rank and had a seat in parliament. The dignity of the second class descended to their male children, but that of the dukes by brevet ceased with themselves. The rank of Duke in the royal family of France was superior to that of prince, and sometimes inferior to that of count. The ducal, along with all other titles of nobility, was abolished at the Revolution, but was restored by Napoleon in 1806. In Germany the dukedom passed through phases similar to that exhibited in France. In 847 the Emperor Louis appointed a duke (Herzog) of Thuringia to protect the frontiers against the Wendes, or Vandals, a Slavonic tribe. The power of the dukes gradually increased, their dignity became hereditary, and they soon became powerful members of the German empire. An archbishop of Cologne, Bruno, was the first who bore (in 959) the title of archduke (Erzherzog), which since the time of the Emperor Frederick III. (1453) has been given exclusively to the princes of the house of Austria. All the Austrian princes are archdukes, as a distinguishing title of the imperial family. In Great Britain the title of Duke ranks as a title of honor or nobility next below that of a prince or princess of the royal blood and that of archbishop of the Church of England. The first hereditary Duke in England was the Black Prince, created by his father, Edward III., in 1336. The duchy of Cornwall was bestowed upon him, and was thenceforward attached to the eldest son of the king, who is considered a Duke by birth. The duchy of Lancaster was soon after conferred on his third son, John of Gaunt, and hence arose the special privileges which these two duchies still in part retain. In the reign of Elizabeth, in 1572, the

DUKE OF CONNAUGHT—DULCIMER

ducal order was extinct, and not revived till the creation of Villiers, Duke of Buckingham, and Ludovic Stuart, Duke of Richmond, by James I. There are over 30 dukes on the British peerage rolls, including those of the blood-royal. The coronet of a British Duke consists of eight strawberry leaves of a conventional type on a rim of gold. In the Bible the word *dukes* is used, Gen. xxxvi. 15, for the *duces*, of the Vulgate.

Duke of Connaught, kōn'nōt, ARTHUR WILLIAM PATRICK ALBERT, Prince of the United Kingdom, Duke of Saxony, Prince of Coburg and Gotha. He was born at Buckingham Palace, 1 May 1850, being the third son of Queen Victoria. He entered the Military Academy at Woolwich 1866; was rapidly promoted, and received his commission as general of brigade in 1880. He had been created Duke of Connaught and Stratheam and earl of Sussex 26 May 1874, and taken his seat in the House of Lords 8 June of the same year. He married Princess Louise Margaret of Prussia, the grand-niece of the Emperor William of Germany, 13 March 1879.

Duke of Exeter's Daughter, a rack in the Tower of London, so called after its inventor, a minister of Henry VI. According to Blackstone it was never put in use.

Duke's Children, *The*, the last of the political novels by Anthony Trollope, published in 1880.

Duke's Laws, so named from the Duke of York, afterward James II., was a code promulgated by Col. Richard Nicolls, the English commander who took New Amsterdam from the Dutch in 1664, and became governor of the colonies under the Duke's patent. They applied first to the Dutch: confirmed the patroons in their estates, which thenceforth were to be called manors; introduced jury trial; amended the criminal code, and provided for freedom of religion and equal taxation, and militia service. There was no popular election of magistrates at first; but the code was afterward modified into the instrument of government of New York and New Jersey.

Dukhobors, doo-kō'bōr, **Dukhobort'sy**. See DOUKHOBORS.

Duk'insfield, England, a borough in county of Chester, a few miles from Manchester. Extensive collieries, cotton factories, engineering, brick and tile works give employment to the greater part of the population. Pop. (1901) 18,929.

Dulag, doo'lāg, Philippines, a town on the eastern coast of the island of Leyte, at the mouth of the Catbassag River. There are large deposits of sulphur in the vicinity. Pop. 10,113.

Dulangan, doo-lān'gān, or **Gulangan**, a heathen tribe of the Philippines, living in the southern part of the province of Davao, island of Mindanao. It is uncertain whether they are of pure Malayan race, or have an infusion of Negrito blood.

Dula'ny, Daniel, American colonial lawyer: b. Annapolis, Md., 1721; d. 1797. He was educated in England, at Eton, Cambridge, and the Temple, and was admitted to the bar of Maryland in 1747. He was deputy commissary general from 1754 to 1761, and a member of

the provincial council from 1757 to 1775. In 1765 he wrote a powerful pamphlet against the Stamp Act, and his arguments against arbitrary taxation furnished material for Chatham's famous speech on behalf of the American colonies in 1766. He was, however, a staunch Royalist, refused to take part in the Revolution, and lost nearly all his landed property by confiscation.

Dulcama'ra, a species of the genus *solanum* of the potato family (*Solanaceæ*), known also as night-shade, blue bindweed, felonwort, poison flower, and bitter-sweet. See BITTER-SWEET.

Dulcama'rin, a glucoside which is separated from the aqueous extract of *Solanum Dulcamara*—bitter-sweet, and consists of a yellow, transparent, resinous, easily powdered mass, readily soluble in alcohol, sparingly in ether, and very slightly in water. It has a slight alkaline reaction, and yields a platinum salt. The narcotic alkaloid solanine is also obtained from bitter-sweet.

Dulce, dool'sā. (1) A lake of Guatemala, on the east coast, communicating with the Gulf of Honduras by the lakelet el Golfete. It is about 30 miles long by 12 broad. (2) A river in Argentina, has its rise in the province of Tucuman, and is called in its lower course the Saladillo River. The waters are salt for some distance from the mouth; and the stream really seems to lose itself in the salt marshes of Lake Porongos. (3) A gulf on the coast of Costa Rica, in Central America.

Dul'ce Do'mum, a famous song sung at Winchester College, England, on the eve of the break-up day for the summer holidays. The origin of both words and music is very uncertain—it is usual to ascribe the former to one Turner, probably him who became bishop of Ely, and was one of the seven bishops under James II.; the latter, to Johannes Reading, organist of the college from 1681 to 1689.

Dulcigno, dool-chēn'yō, Montenegro, a small seaport town on the Adriatic. The inhabitants, formerly notorious under the name of *Dulcignottes*, as the most dangerous pirates of the Adriatic, are now engaged in commerce or in the fisheries of the river Bojana. Pop. 5,102.

Dul'cimer, an ancient musical instrument used by various nations, and, in shape and construction, having probably undergone fewer changes than any other instrument. In its earliest and simplest form, it consisted of a flat piece of wood, on which were fastened two converging strips of wood, across which strings were stretched tuned to the natural scale. The only improvements since made on this type are the addition of a series of pegs, or pins, to regulate the tension of the strings, and the use of two flat pieces of wood formed into a resonance-box, for the body. The German name, *Hackbrett* (chopping-board), points to the manner in which it was played, the wires being struck by two hammers, one held in each hand of the performer. The fact which makes the dulcimer of the greatest interest to musicians is that it is the undoubted forefather of our pianoforte. A modern grand pianoforte is, in reality, nothing more than a huge dulcimer, the wires of which are set in vibration, not by

DULCINEA DEL TOBOSO—DULUTH

hammers held in the pianist's hands, but by keys; it is, in fact, a keyed dulcimer. It is by some supposed to be identical with the psaltery or *nebel* of the Hebrews.

Dulcinea Del Toboso, *dül-sin'ä-ä dël tō bö'sō*, Sp. *dool-thē-nā'ä däl tō-bō'sō*, the fanciful name given by Don Quixote to his lady love, because it was more romantic than her real name, Aldonza. The name is a popular one for the heroine of love romances.

Dul'cinist, one of a sect, followers of Dulcinus, or Dolcino, a layman of Lombardy in the 14th century. See APOSTOLIC BRETHERN.

Dulcite ($C_6H_8O_6$), a saccharine substance obtained by Laurent in 1850 from an unknown sugary plant from Madagascar, which was in rounded lumps, but crystalline when broken through. By dissolving in water, filtering from impurities, and evaporating, the dulcite was deposited in large transparent, lustrous, modified monoclinic prisms. Dulcite has a specific gravity of 1.46. It has a slightly sweet taste, no odor, and no rotatory effect on light. It is soluble in water, very sparingly soluble in alcohol. It fuses about 360° F.; at a higher temperature it loses water and yields *dulcitan*, and at still higher temperature is decomposed, giving off gases and a distillate with an acetous odor. It does not ferment with yeast. Dulcite combines with metallic oxides; the compounds with the alkalis and alkaline earths are crystalline and soluble in water.

Du Lhut, *dü-loot*, **Daniel Greysolon**, American pioneer: b. France about 1645; d. near Lake Superior 1709. He went to Canada about 1670, and became a trader and a leader of bushrangers. He chose the sites of Detroit and Fort William, fought in the Canadian war with the Senecas in 1687, and against the Iroquois in 1689, and was commander of Fort Frontenac in 1695. The city of Duluth is named after him.

Duluth, Minn., city and county-seat of St. Louis County, at the western end of Lake Superior, 1,463 miles from New York, 478 miles from Chicago, 400 miles from Milwaukee; and northeast 522 miles from Omaha, 2,370 miles from San Francisco; and southeast from Seattle 1,919 miles, and 498 miles from Winnipeg. Its area is 69 square miles and it extends along Lake Superior, Duluth harbor, and the St. Louis River from Lakeside to Fond du Lac, a distance of 24 miles. Duluth began at the base of Minnesota Point and has spread east and west along the water line, as well as northward upon the face of the great bluff, which, in the course of a mile from the water's edge, rises to a maximum height of 800 feet. Of its 200 miles of streets, 54.48 were in 1903 paved with various materials or macadamized, while a great deal of new paving work was being done.

Government.—The mayor, treasurer, comptroller, and two aldermen from each ward are elected by the people for two years; the clerk is appointed by the council. The chief of police, city engineer, city attorney, assessor, the city boards and minor officers are appointed by the mayor.

Municipal Improvements.—Street cleaning is a comparatively easy task, the greater part of the city enjoying the benefit of natural drain-

age. Street cleaning costs \$14,814.20 a year, and street sprinkling, \$7,779.74, is assessed to property. The sewage empties, through 40 miles of mains, into Lake Superior and Duluth harbor. Climate, clean streets, and pure water make Duluth one of the healthiest cities in the world, the death rate in 1900 being 13.2.

The city owns the water and gas systems. Water is drawn from a point 10 miles down the north shore of the lake, which is never approached by sewage. The city also owns the gas plant and during its ownership has reduced the price of gas from \$1.90 to 90 cents per 1,000. While thus reducing the price of water and gas, the city has spent a great deal of money on depreciated plants. The total cost of these plants to the city is: Water, \$2,081,072; gas, \$429,860. The police department costs \$49,401, and the fire department, \$101,933.23 per annum.

The electric street railway system consists of about 50 miles of track, representing an investment of \$2,500,000. The Duluth-Superior Traction Company controls the street railway system of both Duluth (Minn.) and Superior (Wis.). The line passes over the great interstate bridge and covers the time between the two cities in 35 minutes. In 1902 there were carried on the street railway system 8,000,000 passengers, and \$285,000 was expended in operating expenses.

Public Parks and Cemeteries.—The Duluth park system consists of five larger parks, two smaller ones, and five city squares. Fairmont Park at West Duluth contains 40 acres; Lincoln, at the West End, 50; Central, Central Duluth, 100 acres; Chester Park, East End, 100 acres; Lester Park, extreme East End, 25 acres; Cascade Park, 6th Street and First Avenue west, whose beauties are indicated by its name, covers 4 acres. Portland Square covers a block at West 4th Street and Tenth Avenue east. The main feature of this park system is Rogers boulevard, and the parks Fairmont, Lincoln, Central, Chester, and Lester. The boulevard is a drive of 7 miles along the bluffs at a height of 500 feet above Lake Superior, which is itself 600 feet above the level of the sea. From this drive is visible one of the finest views in the world. The chief beauties of Duluth's parks lie in the natural loveliness of forests, streams, rocks, and cascades. There are five cemeteries: Calvary Hill, Forest Hill, Oneota, Park Hill, Scandinavian Union, and Swedish Mission.

Chief Buildings.—Among the chief buildings the Central High School is probably the most extraordinary. It stands on a site more than 200 feet above the lake, site and building occupying a whole block. It has four stories, with commodious attic and basement, and a tower 229 feet high. Other prominent buildings are the Carnegie library, the State Normal School, the Spalding and St. Louis hotels, the Lyceum Theatre, the new buildings in the wholesale district, of which the Marshall-Wells is the largest wholesale hardware building under one roof in the world; the Wolvin building, and the huge elevators and flouring mills; the Board of Trade, and Federal buildings. The Duluth Public Library building was the donation of Andrew Carnegie. The fund was \$75,000. The building and grounds represent an outlay of \$93,000. The library now contains 40,000 volumes.

DULUTH

Among churches are the Cathedral, and 7 other Catholic churches, 6 Episcopal, 6 Baptist, 1 Christian Science, 2 Congregational, 1 Swedish Covenant, 3 Evangelical, 17 Lutheran, 11 Methodist Episcopal, 1 Unitarian, 1 Salvation Army Corps, and 2 Hebrew synagogues.

Educational and Intellectual Associations.—The city had in 1903 1 high school, 31 elementary and kindergarten schools, with 32 school buildings, an average daily attendance of 8,791 pupils and 258 teachers; 3 Roman Catholic parochial schools, and an Institute of the Sacred Heart. The new State Normal School had 100 pupils at the opening in 1903. The hospitals have a training school for nurses. The value of public property used for school purposes was in 1903 \$1,869,700 and the total expenditure for public schools for the school year 1903-4 was \$309,773.76. In 1903 Duluth had 2 daily papers, 6 weeklies, and a bi-weekly.

Manufactures.—The manufactures of Duluth, according to the census of 1900, were: Establishments, 433; capital, \$8,872,940; employees, 3,998; wages paid, \$2,145,444; cost of materials, \$5,861,499; total value of product, \$10,628,957; lumber and timber product, \$3,800,000; planing mill product, \$172,943; foundry and machine, \$475,848. In 1903 the Great Northern Power Company had acquired practically all the water power available at the head of Lake Superior. This water comes down through a vast drainage through the rapids of the St. Louis River to a point within the city of Duluth. These rapids aggregate a fall of nearly 600 feet. The company divided this power into two systems; the St. Louis Development, under a head of 365 feet, and the Duluth Heights System, under a head of 740 feet. For the first installation on the St. Louis rapids, the company had in 1903 a full-developed plan to build a steel dam 36 feet high and 628 feet across the river at the head of the rapids, thus creating a reservoir or forebay, about one mile square in extent, whence a canal 62 feet in width at the surface and 14 feet deep was to carry the water $2\frac{1}{2}$ miles to the brow of a hill, and thence by a series of wood stave and steel pipes to the main power house at the foot of the rapids under an effective head of 365 feet. The company aims at an ultimate development of 100,000 electric horsepower. This power is to be transmitted not only to Duluth but to Superior, the iron ranges and to other towns a long distance away.

The Duluth Heights System has a capacity of 200,000 horsepower additional, which is to be developed later on under an effective head, estimated at 740 feet, from the bluff directly back of the city of Duluth. The possibilities of the St. Louis water power have been appreciated for many years and engineers have been working on the problem of harnessing it to do man's work for a quarter of a century. The cities of Duluth and Superior voted liberal franchises to the company in 1902 and 1903, and in the latter year were looking forward confidently to developments which would revolutionize manufacturing at the head of Lake Superior. The Zenith Furnace Company, capitalized at \$950,000 in 1903, equipped a modern blast furnace at West Duluth with a daily capacity of 250 tons of pig iron. The company in the same year established a coking by-product plant. The company at the same date entered

into a contract with the city of Duluth to supply the latter with gas.

Trade and Commerce.—As the western terminus of the marine traffic of the Great Lakes, Duluth holds an important place in world-commerce. For 1902 the aggregate of vessel arrivals and departures at this port was 9,659. The arrivals numbered 4,816 and the departures 4,843. The registered net tonnage of arrivals and departures aggregated 13,927,284 net tons. In 1902 the total receipts of freight at the port of Duluth were 1,291,357 net tons, of a valuation of \$31,431,750, and the shipments were 7,884,236 net tons of a valuation of \$65,080,803. The total of freight received and shipped was 9,175,593 tons and the valuation of the same was \$96,512,553. The shipments of iron ore from Duluth for 1902 were 5,598,408 gross tons, as compared with 3,437,955 gross tons in 1901. Two Harbors, which holds the world's season record for the amount of iron ore forwarded from a single shipping point, is a sub-port of Duluth. Its record in 1902 was 5,605,185 gross tons as against 5,018,197 gross tons in 1901.

Duluth leads all other ports on the Great Lakes in point of vessel tonnage enrolled. It is the port of hail for 331 vessels, having an aggregate gross tonnage of 493,620, as shown by figures in the port collector's office, June 1903. Eleven lines ply regularly in the steamboat merchandise trade of Duluth, carrying both passengers and freight. Of the great number of coarse, bulk cargo lines, the Pittsburg Steamship Company, with 112 boats, controlled by the United States Steel Company, is the first.

The grain elevator storage capacity of Duluth is 17,000,000 bushels. There are two systems, the Consolidated Elevator Company, owning eight houses and having a total capacity of 12,000,000 bushels, and the Peavey system, with a total capacity of 5,000,000 bushels. The latter has the largest concrete elevator in the world and the only one of the kind in the United States. Its capacity is 4,000,000 bushels, and that of the working-house 1,000,000 bushels. For the crop year ending 31 July 1903 the total receipts of grain at Duluth were 26,296,921 bushels, of which the Consolidated received 17,900,000 and the Peavey 8,396,921 bushels.

The lumber shipments from this port for 1902 amounted to 279,787,788 feet. There are five coal docks, with an average storage capacity of about 1,000,000 tons. The receipts for 1902 were 818,532 tons of bituminous and 87,383 of anthracite.

The striking natural feature of the Duluth-Superior harbor is the great breakwater formed during countless ages by the contending waters of Lake Superior and of the St. Louis and Nemadji rivers descending from the heights. The seven miles of this breakwater to the northward is called Minnesota Point. The two miles at the south, from the natural entry to the Wisconsin mainland, is called Wisconsin Point. The Duluth Canal cuts this point about half a mile from the main land, and was originally the work of the people of Duluth, although the United States government subsequently took charge of it; and some years ago undertook the widening of it. It is 300 feet wide and 1,700 feet long and 25 feet deep, running between cement piers 10 feet high, which were completed in 1901 at a cost of \$550,000.

DUMANJUG—DUMAS

Duluth has eight railroads: Great Northern, Northern Pacific, Chicago, Milwaukee & St. Paul; Wisconsin Central; Chicago, St. Paul, Minneapolis & Omaha; Duluth & Iron Range; Duluth, Missabe & Northern, and the Duluth, South Shore & Atlantic.

Headquarters of six of the large constituent companies of the United States Steel Corporation are located in Duluth. They are engaged in the mining of ore on the Missabe and Vermilion ranges north of this city; in the carrying of it over railroads to the shore of Lake Superior, and in the transportation of it from docks here and in Two Harbors to the corporation's smelters and rolling mills in eastern States. The iron output of the ranges is practically controlled by the United States Steel through these constituent companies. The six are: The Minnesota Iron Company, Chandler Iron Company, and Oliver Mining Company, including over a score of mining firms in the combination of the trio; the Duluth, Missabe & Northern Railroad Company, the Duluth & Iron Range Railroad Company, and the Pittsburgh Steamship Company.

The most extraordinary feature of Duluth's commerce during recent years is the growth of her wholesale trade, particularly in the line of hardware and groceries, which has spread to the Pacific coast and even to Alaska.

History.—Groselliers, a French fur trader, and his associates were the first white men who visited what is now Duluth. In 1660 they shipped from the head of Lake Superior 60 canoes laden with furs. Daniel Greysolon Du Luth, after whom Duluth was named, was a French officer, who urged by an adventurous spirit led a strong party to the westward, following the line of the Great Lakes. He traded with the Indians at Fond du Lac in 1679, and it has been believed that he at one time maintained a camp on Minnesota Point. It was not until 1854 that the Indian title to the territory on which this city is built was extinguished by treaty. An election for the Territory of Minnesota, the object of it being to choose a delegate to Congress, was held on the unorganized, unplatted town-site of Duluth in October 1855. In May 1857, Duluth was incorporated as a town by an act of the territorial legislature. In 1867 a railroad from Duluth to St. Paul was begun and in 1870 the St. Paul & Duluth, the first railroad, was completed. In the same year Duluth was organized as a city; but the Jay Cooke failure of 1872 was a blow to the new mart of commerce and she relapsed into a village, retaining that status until 1890. Real work for the development of the iron ranges began in 1878, and in 1882 the first iron range railroad was completed between Two Harbors and Vermilion Lake. The hand of panic fell hard on Duluth in 1893 and depression lasted until 1899, since which time the city has enjoyed an exceptional share of prosperity.

Population.—The population of Duluth was 3,470 in 1880; 33,187 in 1890; and 52,969 in 1900. At the last date the foreign-born population was 39.6 of the total, the leading nationalities being as follows: Canadian English, 5,099; Swedish, 5,047; Norwegian, 2,655; German, 1,685; Canadian French, 1,285; Polish, 920; English, 817; Irish, 792; Finnish, 702; Italian, 202.

A. M. FLAGG,

Editor Duluth News Tribune.

Dumanjug, doo-män-hoog', Philippines, a town of the province of Cebu, situated on the west coast at the mouth of the Dumanjug River, 37 miles southwest of Cebu. It is open to the coast trade, and is a military station. Pop. 13,171.

Dumas, dü-mä, **Alexandre**, the Elder, French dramatist and novelist: b. Villers-Cotterets 24 July 1803; d. Puits, near Dieppe, 5 Dec. 1870. He was the son of a Republican general who bore the same name, and grandson of Marquis de la Pailletterie and a negress, Tiennette Dumas. He went to Paris at the age of 20, to push his fortune, and was employed by the Duke of Orleans as secretary at 1,200 francs a year. He now devoted his leisure hours to completing his education, and his ambition prompted him to shine in the field of literature. Some of his lighter dramatic works were rejected by the theatrical directors, some were accepted, and had more or less success, bringing but little fame or profit to their author. At last, in 1829, his drama of 'Henri III.' appeared on the stage of the Comédie Française. It was produced when the battle between the Romanticists and the Classicists was at its height, and hailed as a triumph by the former school. The piece became popular and brought the lucky dramatist the sum of 30,000 francs, and the post of librarian to the Duke of Orleans. The same year appeared his 'Christine,' and in quick succession, 'Anthony'; 'Richard d'Arlington'; 'Térésa'; 'Le Tour de Nesle'; 'Catharine Howard'; 'Mlle. de Belle-Isle,' etc. Dumas had now become a noted Parisian character. The critics fought over the merits of his pieces, and the scandalmongers over his prodigality and *galanteries*. Turning his attention to romance, and desirous of becoming the Walter Scott of his country, he produced a series of historical romances, among which are: 'Les Deux Dianas'; 'La Reine Margot'; 'Les trois Mousquetaires,' which, with its continuations, occupies eight volumes. The 'Comte de Monte-Cristo,' and the 'Mémoires d'un Médecin,' are also well known through translations to English and American readers. Several historical works also bear his name: 'Louis XIV. et son Siècle'; 'Le Regent et Louis XV.'; 'Le Drame de '93'; 'Florence et les Médecins,' etc. In 1846 he accompanied the Duke of Montpensier to Spain as the historiographer of his marriage; and on his return to Paris he opened a theatre for the purpose of producing only his own pieces; and built a fantastic and costly country-seat, which was known as the Château de Monte-Cristo, and on which he expended 450,000 francs.

It is difficult to come to a satisfactory conclusion as to the merits of this author. Some of his productions are little else than mere translations from English and German sources. His first drama, 'Henri III.' is but a skillful piece of patchwork, Walter Scott and Schiller furnishing him with the bulk of the material. Equally fatal to his reputation is our knowledge of the fact, gained from a lawsuit he had with the *Presse* and the *Constitutionnel* newspapers, and from a work by Mirecourt, entitled, 'Fabrique de Romans, Maison A. Dumas et Cie.' (Dumas & Company's Romance Factory), that he had arranged to supply those journals during the year with more novels than the most expert scribe could copy in the time, and

that he had in his pay numerous hacks who did the serious part of the work. The only claim he could lay to a great number of the productions issued under his name, was that he either sketched the plot or revised them before going to press. Yet of the talent and even genius of Dumas there can be no reasonable doubt; he had great fertility of invention, much humor and gaiety, and genuine dramatic power, as the works that were undoubtedly from his pen sufficiently testify; and it was not till he had secured a front rank in literature by his own exertions that he descended to the unworthy plan of employing assistants to manufacture novels to order. See Blaze de Bury, 'Alexandre Dumas, sa vie, son temps, son œuvre' (1885); Wells, 'Century of French Fiction' (1898); Parigot, 'Le drame d'Alexandre Dumas' (1898); and 'Alexandre Dumas père' (1902); Spurr, 'Life and Writings of Alexandre Dumas' (1902).

Dumas, Alexandre, the Younger, French dramatist and novelist: b. Paris 28 July 1824; d. there 27 Nov. 1895. He was the natural son of Dumas the Elder (q.v.), and while a young man shared his father's life in Paris, and accompanied him on his travels. In 1847 there appeared a collection of his poems under the title 'Péchés de Jeunesse'; his first novel 'Aventures de Quatre Femmes et d'un Perroquet,' was published in the same year; others of his novels are 'Césarine' (1848); 'La Dame aux Camélias' (1848); 'Le Docteur Servan' (1849); and 'L'affaire Clemenceau' (1866). 'La Dame aux Camélias' was dramatized in 1852, and marked the introduction of realism in the treating of social and moral problems on the stage. His other dramas include: 'Diane de Lys' (1853); 'Le Demi Monde' (1855); 'La Question d'Argent' (1857); 'Le Fils Naturel' (1858); 'Un Père Prodiges' (1859); 'L'Ami des Femmes' (1864); 'La Femme de Claude' (1873); 'La Princesse de Bagdad' (1881); 'Denise' (1885); and 'Francillon' (1887). He has also written a few essays, discussing social problems; these are: 'Lettre sur les Choses du Jour' (1871); 'L'Homme-Femme' (1872); 'Question du Divorce' (1880); 'Recherche de la Paternité' (1883). Dumas was made a member of the French Academy in 1874.

Dumas, Jean Baptiste André, zhôn bāp-tēst ān-drā, French chemist: b. Alais, Gard, 14 July 1800; d. Cannes, France, 11 April 1884. He studied at Geneva, and going to Paris in 1821, was first a lecturer in the École Polytechnique, then professor of chemistry in the Athénée, the École Centrale des Arts et Manufactures (founded by himself), and finally, the Sorbonne. He now wholly devoted himself to chemical studies; and his views on chemical equivalents, and especially his memoir on the atomic theory, soon attracted attention over all Europe. His views on the laws of substitutions involved him in a long discussion with the great Berzelius. His researches in organic chemistry, especially his masterly papers on the ethers, ethereal oils, indigo, and the alkaloids, placed him in the first rank of chemists. In 1849-51 he was minister of agriculture and commerce, and also held offices under the Second Empire. In 1875 he was called to fill Guizot's chair in the Academy. His chief works are: 'Traité de Chimie appliquée aux Arts,' and 'Leçons sur

la Philosophie Chimique.' See Maindron, 'L'Œuvre de J. B. Dumas' (1886).

Dumas, Matthieu, French soldier and military writer: b. Montpellier, France, 23 Dec. 1753; d. Paris 16 Oct. 1837. He early entered the French cavalry, took part in the American Revolution, and was employed in the Levant and in Holland. At the commencement of the French Revolution he assisted Lafayette in organizing the National Guard. On the triumph of the extreme party in 1797 Dumas was proscribed, but made his escape to Holstein, where he wrote the first part of his 'Précis des Événements Militaires,' a valuable source for the history of the period of which it treats (1798-1807). After the Restoration, Louis XVIII. appointed him councilor of state and gave him several important appointments connected with the army. In 1830 he aided in bringing on the revolution of July, and after the fall of Charles X. obtained the chief command of all the national guards of France, together with a peerage.

Du Maurier, dü mō-rē-a, George Louis Palmella Busson, English artist, caricaturist, and novelist: b. Paris 6 March 1834; d. London 8 Oct. 1896. He belonged to an old French family which had been driven to England by the Revolution, and was a naturalized British subject. He spent some years in France and Belgium, and afterward went to school in London. He soon adopted art as a profession, working as a student in the galleries of the British Museum. Then, returning to Paris, he entered the studio of Gleyre, and next went to Antwerp to continue his artistic training. Returning to London, he began to draw on wood for 'Once a Week,' the 'Cornhill Magazine,' etc., and also exhibited at the Royal Academy. He subsequently joined the 'Punch' staff and became famous through his weekly drawings for that publication. He also illustrated a large number of books, including Thackeray's 'Esmond' and 'Ballads.' A collection of his 'Punch' woodcuts was published in 1880 under the title 'English Society at Home.' In 1891 appeared his first novel, 'Peter Ibbetson,' and in 1894 'Trilby,' a story which had a great popularity both in book form and on the stage. An incomplete novel by him was published posthumously as 'The Martian.' His novels can hardly be looked upon as very serious contributions to literature, but his 'Punch' drawings will no doubt have a permanent value as portraying many of the peculiarities of contemporary society.

Dumb Ague, an irregular intermittent fever, so named from the absence of shivering chills. See MALARIA.

Dumb-bell. See GYMNASTICS.

Dumb-cane, a popular name for a West Indian plant (*Dieffenbachia sequina*) of the arum family. The acidity which is characteristic of most of the members of the arum family in this species causes a swelling of the tongue with excruciating pain, if the plant is chewed, and for a time destroys the power of speech, whence its name. Many species and varieties of *Dieffenbachia* are in cultivation as foliage plants.

Dumbar'ton (ancient LENNOX or LEVENIX), (1) A maritime county of Scotland. Pop. (1901) 113,870. (2) A seaport, and the chief town in the

DUMBNESS — DUMONT

county, on the Leven; 13 miles northwest of Glasgow. Ship-building is the chief business, the six principal yards employing about 4,000 men. The rock and castle of Dumbarton, a short distance from the town, is noted in history. The fortress was erected over a thousand years ago. It is one of the four fortresses stipulated to be kept in repair by the articles of the Union. Pop. (1901) 19,864.

Dumbness, inability to speak. In a very large number of cases it arises from no malformation of the organs of speech, but is a necessary sequence of congenital deafness. A child acquires language by listening to and imitating the speech of its relatives or other people who talk in its presence, and picks up not merely the language of its country, but the exact pronunciation of the locality in which it for the time is. Total deafness, therefore, naturally produces dumbness. Distinct from congenital dumbness is the loss of speech in the case of those who have become affected with aphasia, which results from some disease of the brain, and aphonia, which is due to disease of the larynx or vocal chords. See DEAF-MUTES.

Dum'dum, India, town, municipality, and cantonment in the province of Bengal, five miles east-northeast of Calcutta. The town is famous as being the scene of the first open manifestation of the Sepoys against the greased cartridges, which led to the outbreak of the mutiny of 1857. Pop. (1891, including the military), 21,000.

Dumdum Bullet, a bullet so named after Dumdum Arsenal, the place near Calcutta where it was first made. It is one which instead of having its greatest strength at the point is weakest there, so that in striking a bone it will flatten out and shatter it, and not, like the modern steel-coated, sharp-pointed bullet, make a small hole and pass through without any other effect. At Santiago the Spaniards were charged with cutting off the brass tips of their bullets so that they had the same effect in inflicting jagged wounds as the regular dumdum bullets. Dumdum bullets are now used to some extent by big game hunters. The Hague Peace Congress agreed that dumdum bullets should not be used in war. In the war against the Boers in South Africa (1899-1902) the British were charged with using a modification of this bullet. See BULLET.

Duméril, André Marie Constant, än-drä mä-rê kôn stän dü-mä-rêl, French physician and naturalist: b. Amiens 1 Jan. 1774; d. Paris 2 Aug. 1860. From 1801 to 1818 he was professor of anatomy and of physiology of the medical faculty of Paris. His works on natural history and analytical zoology are distinguished both for accuracy of details and for philosophical treatment. In his most celebrated production, 'L'erpétologie générale' (1835-51), which contains the first attempt at a systematic description of all known reptiles, he had Bibron as collaborator.

Dumersan, dü-mär-săn, Théophile Marion, French playwright: b. Issoudun 4 Jan. 1780; d. Paris 13 April 1849. He was employed in the Paris mint. He wrote many plays, all marked by keen observation and comic spirit. His 'Angel and Devil,' a five-act drama, had a "run" of over 100 presentations; still more successful

was his 'Mountebanks,' his masterpiece and a classic in its kind. Other very successful plays written by him are: 'The Wigmaker, or Heads à la Titus'; 'Ridiculous Englishwomen.' Worthy of mention is his volume of 'National and Popular Songs of France.'

Dumfries, düm-frêz', a maritime county, Scotland; area 1,098 square miles. The surface is irregular; about one half is good farming land, and valuable minerals are found in the hill sections.

Dumfries, a river port, railroad centre and parliamentary borough, capital of the county of same name, and the chief town in the south of Scotland; on the Nith, about six miles from its junction with the Solway Firth. It is connected with the suburb Maxwelltown (in Kirkcudbright) by three bridges, one dating from the 13th century. Pop. (1901) 72,569.

Dummer, Jeremiah, American scholar: b. Boston about 1680; d. in Plaistow, England, 19 May 1739. He was graduated at Harvard College in 1699, where he was noted for the vigor and brilliancy of his genius. With the purpose of preparing for the clerical profession, he went abroad, and studied in the university of Utrecht. On his return to America he abandoned his chosen vocation, and soon after went to England, where, as agent of Massachusetts, he rendered important services to his countrymen. He was an admirer of Lord Bolingbroke, in whose daring and reckless genius he found much that was congenial to his own character, and in intimacy with whom he adopted something of his moral and religious license. He published theological and philosophical disquisitions in Latin while at Utrecht, and his 'Defence of the New England Charters,' written in England (1728), is admirable both in style and matter. The traditions and records concerning him alike testify to his remarkable powers, and his easy command of them in speaking, writing, and in intercourse with men.

Dummer's War, 1724-5, an episode in the long struggle of the French governors of Canada to check English settlement by inciting the Indians to raids and massacre of the border settlers. It was named after William Dummer, acting-governor of Massachusetts, who organized the resistance against the Indian expeditions sent by Vandreuil, governor of Canada, against the villages of Massachusetts and Maine, and of Vermont where Fort Dummer had been built on the site of Brattleboro in 1724. One of its chief incidents was the aggressive retaliation of Dummer and the victorious assault by the English on Norridgewock, Me., when Sebastian Rale, the Jesuit missionary and Indian leader, was killed with 26 Abenaki Indians, 12 Aug. 1724. The further crushing decimation in Lovewell's fight (q.v.) at Fryeburg, Me., 8 May 1725, led to four Indian chiefs signing a treaty for the Penobscots and other Abenakis at Boston in November 1725, which was ratified by the latter the following year.

Du Mond', Frank Vincent, American artist: b. Rochester, N. Y., 1865. He was a pupil of Boulanger, Lefebvre and Benjamin Constant, and received a third-class medal at the Paris salon in 1890.

Dumont, dü-môn, Albert, French archaeologist: b. Secy-sur-Saône, 1842; d. 1884. He

was educated in Paris, and devoting himself to the study of prehistoric, Byzantine, and Christian archaeology, published 'De Plumbeis apud Græcos Tesseriis' (1870); 'Inscriptions céramiques de Grèce' (1871); and 'Vases peints de la Grèce propre' (1873). In 1874, in Rome, and the following year in Athens, he lectured on archaeology and the history of art. In 1878 he was elected rector of the academy of Grenoble, in 1879 rector of the academy of Montpellier, and until his early death was a superintendent of higher education. The most important of his later works is 'Les céramiques de la Grèce propre, vases peints et terres cuites' (1882-90), prepared in collaboration with Chaplain.

Dumont, dü-môn, Augustine Alexandre, French sculptor: b. Paris 14 Aug. 1801; d. there 25 Jan. 1884. He was a most prolific worker, and his statues are found on or in many of the public buildings and churches of his native city. His most noted productions are, the colossal statues of the 'Genius of Liberty' on the Column of July, made in 1840, and the statue of Napoleon III. on the Column Vendôme.

Dumont, Julia Louisa, American educator and writer: b. Waterford, Ohio, October 1794; d. Vevay, Ind., 2 Jan. 1857. She has the distinction of being one of the earliest women of the West whose writings have been preserved. She contributed largely to periodicals both in prose and verse. A collection of her writings was published in a volume, 'Life Sketches from Common Paths' (1856).

Dumont, Pierre Etienne Louis, pē ār ā-tē-žen loo-ē dü-môn, Swiss scholar: b. Geneva 18 July 1759; d. Milan, Italy, 30 Sept. 1829. In 1785 he became tutor in London to the sons of Lord Shelburne. His superior talents soon recommended him to the illustrious Whigs of that period; with Romilly, in particular, he formed a close friendship. During the early years of the French Revolution, Dumont was at Paris, where he became greatly attached to Mirabeau, regarding whom he has given the world much valuable information in his posthumous 'Souvenirs sur Mirabeau' (1832). In this work he claims to have composed for him many of Mirabeau's most eloquent speeches. In 1791 Dumont returned to England, and formed an intimacy with Bentham (q.v.). This was the event of his life. Deeply convinced of the value of Bentham's views on legislation, he requested him to allow him to arrange and edit his unpublished writings on this subject. Bentham gave him his manuscripts, which Dumont labored earnestly to abridge, elucidate, correct, and simplify. The results appeared in his 'Traité de Législation Civile et Penale' (1802); 'Théorie des Peines et des Récompenses' (1811); 'Tactique des Assemblées Législatives' (1816); 'Preuves Judiciaires' (1823); and the 'Organisation Judiciaire et Codification' (1828). Dumont returned to Geneva in 1814, and became a member of the representative council.

Dumont D'Urville, Jules Sebastien César, zhül sâ-bās-tē-ôn sâ-zâr dü-môn dür-vêl, French navigator: b. Condé-sur-Noireau, Calvados, 23 May 1790; d. near Paris 8 May 1842. After completing his studies at Caen he entered the navy, in which he ultimately rose to be vice-admiral. He was twice wrecked and on both occasions owed his escape chiefly to self-possession and skilful seamanship. He rendered im-

portant service by his search for the remains of the ill-fated expedition of La Pérouse, the survey of long tracts of coast in New Zealand and New Guinea, the discovery of numerous islands and an antarctic continent, and the exploration of very dangerous and still imperfectly known tracts of navigation, as Torres' Straits, in Australia, and Cook's Straits, between the two large islands of New Zealand. To his contributions to geography he was indebted for his nomination to the office of president of the Paris Geographical Society. One fruit of his voyages was the 'Enumeratio Plantarum in Insulis Archipelagi et Littoribus Ponti Euxini' (1822). After his second circumnavigation, he published the 'Voyage de l'Astrolabe' (1830-9), and 'Voyage Pittoresque autour du Monde' (1834).

Dumortierite, a native basic silicate of aluminum, of somewhat uncertain composition. It crystallizes in fibrous or columnar forms belonging to the orthorhombic system, and has a hardness of 7 and a specific gravity of about 3.3. It is transparent or translucent, with a vitreous lustre and a blue or greenish blue color, and is strongly pleochroic. Dumortierite occurs near Lyons, France, and also in certain parts of Norway and Silesia. In the United States it is found in New York city, and in Yuma County, Arizona. The mineral is named for Eugene Dumortier, a French palæontologist.

Dumoulin, dü-moo-lân, John Philip, Canadian Anglican bishop: b. Dublin, Ireland, 1836. He was educated at Trinity College in the city of his birth, and emigrating to Canada was ordained priest in 1863. After an extended experience as a parochial clergyman he was appointed rector and canon of St. James' Cathedral, Toronto, in 1882, and in 1896 was elected third bishop of Niagara.

Dumouriez, Charles François, shärl frän-swä dü-moo-rê-ä, French general: b. Cambrai, 25 Jan. 1739; d. near Henley-upon-Thames, 14 March 1823. He entered the army early in life and at 24 years of age had received 22 wounds, and was made a knight of St. Louis. In 1772, Louis XV. sent him with communications to Sweden, but he was arrested, and for a long time confined in the Bastille. In 1789 we find him a principal director of the Jacobin club, composed of all who aspired to be accounted the friends of liberty. He afterward became a minister of Louis XVI., when he strongly advised the monarch to yield the direction of the interior affairs of the kingdom to the council of the assembly then sitting, and to declare war against the foreign foes of France. The advice was disregarded and Dumouriez was dismissed. Still determined to devote himself to the service of the army, he proceeded to Valenciennes, where he soon gained fame by his valor and his firmness, displayed at the head of the French soldiers, having succeeded Lafayette in the command of the Army of the North. He rendered very important service to his country by the stand he so skilfully made against the Prussian invaders in the forest of Argonne, in September 1792, the famous "Cannonade of Valmy" taking place on the 20th of the same month. His rapid conquest of Belgium followed. Notwithstanding his success, the Directory, not without motive, entertained suspicions regarding his designs. Dumouriez had entered into secret negotiations with the enemy, and learning that an

DUN — DUNCAN

accusation of treason was to be brought against him, he fled to the Austrian headquarters. He refused, nevertheless, to serve against his country; wandering for some time through Europe, and lastly settled in England.

Dun, Edwin, American diplomatist: b. Chillicothe, Ohio, July 1848. He went to Japan in 1873, becoming successively United States second secretary of legation, first secretary of legation, and was from 1893 to 1897 United States minister. During the war between China and Japan the Chinese government placed its interests in Japan in his care.

Dun (Celtic *dun*, Irish *dūn*, Gael *dūn*, a hill, castle), a word used as a prefix or suffix in the names of cities as, in Augustodunum (Autun), and in many names in Scotland and Ireland, as in Dunblane, Dundee, Dundalk, Dunboyne, etc.

Dūna, or **Southern Dvina**, so named to distinguish it from the northern Dvina, a west Russian river, which flows from a small lake near the source of the Volga, in the southwest of the government of Tver, and after a circuitous route of about 650 miles with a generally north-western trend, empties into the Gulf of Riga, 10 miles below Riga. For some distance it forms the boundary between the governments of Vitebsk and Livonia on the north bank, and Vilna and Courland on the south bank. Although obstructed by rocks and rapids, it is navigable for ocean vessels to Riga, for vessels of lighter draft to Dünaburg, and for flat-bottomed barges almost from its source; it commands a large river traffic; on an average it is icebound 115 days in the year. Canals connect it with the Volga, the Beresina, the Niemen, and Lake Ilmen.

Dünaburg, dü'nä-boorg, or **Dvinsk**, Russia, a fortified town of Russia, government of Vitebsk, on the Dūna, 112 miles southeast from Riga. It was formerly the capital of Polish Livonia. It is of great military importance, and carries on a considerable trade. Pop. 72,231.

Dunant, Jean Henri, zhōn ōn-rē dü-nān, Swiss philanthropist: b. Geneva 1828. While traveling near the battlefield of Solferino in 1859, he took part in the relief of those wounded in that battle, and realized the inadequacy of the provisions for the work. As the result of his experiences there he wrote 'Un Souvenir de Solferino,' advocating more efficient care of the wounded on the field of battle. He also lectured on the subject before the Society of Public Utility in Geneva, and enlisted the sympathy of the president and other members. A meeting of the society was called to consider the formation of permanent organizations for the relief of the wounded, and from this grew the conference at Geneva in 1864, and the Red Cross Society (q.v.). Dunant devoted his fortune to the organization and work of this society, and was pensioned by the empress of Russia. He has written 'L'Empire Romain reconstitué' (1858); 'Fraternité et Charité Internationales en Temps de Guerre' (1864); 'L'Esclavage chez les Musulmans et aux Etats Unis de l'Amérique' (1863); and 'La Rénovation de l'Orient' (1865).

Dunbar, Paul Laurence, American author: b. of negro parents, Dayton, Ohio, 27 June 1872. He was graduated at the Dayton high school in

1891, and since then has devoted himself to literature and journalism. Since 1898 he has been on the staff of the librarian of Congress. He has published 'Oak and Ivy' (poems) (1893); 'Majors and Minors' (1895); 'Lyrics of Lowly Life' (1896); 'Folks from Dixie' (1898); 'The Uncalled,' a novel (1898); 'Lyrics of the Hearthside' (1899); poems of 'Cabin and Field' (1899); 'The Strength of Gideon' (1900); 'The Love of Landry' (1900); 'The Spirit of the Gods,' a novel (1901); 'The Fanatics,' a novel (1901).

Dunbar, William, Scottish poet: b. Salton, Lothian, about 1465; d. about 1525. He was a Franciscan friar, but was often employed by James IV. in affairs of state. Among his works are the panegyric poem 'The Thistle and the Rose,' written (1503) on the marriage of James with Margaret of England, and 'The Golden Targe' (1508), consisting of allegories in the fashion of the time and of Chaucer, among them a poem on 'The Dance of the Seven Deadly Sins Through Hell.' He is at his best in burlesque poetry, as witness the autobiographical 'Visitation of St. Francis.' He is as 'rich in fancy as Spenser; as homely and shrewd as Chaucer in the 'Miller's Tale'; as pious as Cowper in his hymns, and as wittily grotesque as Burns in 'Death and Dr. Hornbook.'"

Dunbar, Scotland, a royal and municipal borough and seaport in Haddingtonshire, at the mouth of the Firth of Forth. It is a place of great antiquity, having originated in a castle, once of great strength and importance, which underwent several memorable sieges; on one occasion being successfully defended against the English for 19 weeks by Black Agnes, countess of Dunbar. Queen Mary and Bothwell (1567) took shelter in this castle. In 1650 Cromwell, at the "Race of Dunbar," totally defeated the Scottish army under David Leslie. The harbor, opened in 1844, is not very commodious, but the town is an important fishing station. Pop. 3,545.

Duncan, Adam, Viscount, Scottish naval officer: b. Dundee 1 July 1731; d. Scotland 4 Aug. 1804. He went to sea when young and was a post-captain in 1761. In the following year he served at the taking of Havana; and in 1779 he shared in the victory of Admiral Rodney over the Spaniards. In 1795 he was appointed commander of the North Sea fleet, and in October 1797, won a brilliant victory over the Dutch fleet off Camperdown, for which he was rewarded with the title of Viscount Duncan and a pension of \$10,000 a year.

Duncan, Norman, American journalist: b. Brantford, Ontario, Canada, 2 July 1871. He was educated at the University of Toronto 1891-5, entered journalism and is at present (1903) on the editorial staff of the New York *Evening Post*. He has written short stories and sketches for the 'Atlantic Monthly,' 'McClure's Magazine' and others, and has published 'The Soul of the Street: Stories of the New York Syrian Quarter' (1900).

Duncan, Sarah Jeanette. See COTES, SARAH JEANETTE.

Duncan, Thomas, Scottish painter: b. Kinclaven, Perthshire, 24 May 1807; d. Edinburgh 25 May 1845. He began to exhibit at the Scottish Academy in 1828, and became an aca-

DUNCAN — DUNDAS ISLAND

demician in 1830. The first picture which extended his fame beyond the Tweed, and helped to procure his admission as an associate of the Royal Academy (1843), was 'Prince Charles Edward and the Highlanders entering Edinburgh after the Battle of Prestonpans' (1840). Another famous picture of his is 'Charles Edward asleep after Culloden, protected by Flora Macdonald.' His last exhibited work was the 'Martyrdom of John Brown of Priesthill,' now in the Corporation Gallery of Glasgow. He also executed many portraits.

Duncan, William Wallace, American clergyman: b. Boydtown, Va., 20 Dec. 1839. He was graduated at Wofford College (S. C.) in 1858, becoming a minister of the Methodist Episcopal Church, South, and serving as chaplain of a Confederate regiment during the Civil War. From 1875 to 1886 he was professor of intellectual and moral philosophy at Wofford College. Since 1886 he has been a bishop of the Methodist Episcopal Church, South.

Duncansby Head, a picturesque promontory, forming the northeastern extremity of Scotland, in the county of Caithness. It consists of a circular rocky eminence of about two miles in circumference, and is intersected by large ravines and remarkable fissures. About a mile and a half west stood the celebrated John O'Groat's house, of which no trace now remains.

Dunce, a word introduced by the Thomists or disciples of Thomas Aquinas, in ridicule of the Scotists, or disciples of John Duns Scotus, schoolman, who died 1305 A.D., to denote a subtle sophist given to caviling where he cannot refute. When the reaction against the schoolmen took place at the Reformation the merits of those acute metaphysicians were temporarily decried, and the celebrated John Duns Scotus coming in for a more than ordinary share of disparagement, he, though a man of very subtle intellect, was held by the more ignorant or prejudiced of the Reforming party to be a man of invincible stupidity. He was therefore made to stand as the prototype of all modern dunces. Succeeding generations have the unfavorable verdict thus passed on the cultivators of scholastic philosophy. The schoolmen were the intellectual leaders of the age in which they lived, and rendered good service to humanity.

Dunciad, dūn'sī-ād, **The**, a celebrated satirical poem by Pope, in which he gibbets his critics and foes. The first three books were published in 1728; the fourth book, or 'New Dunciad,' appeared in 1742. Cibber was latterly substituted for Theobald as the hero.

Duncker, doon'kér, Dora, German story-writer and humorist: b. 28 March 1855. The conceits 'Incurable' (1893); 'The Sphinx,' and other tales and comedies, have succeeded; while in 'Modern Masters' (1883) she has evolved excellent character studies.

Duncker, Maximilian Wolfgang, German historian: b. Berlin 15 Oct. 1811; d. Anspach 21 July 1886. Politics interested him in early years, but his later energies were given to elaborate historical investigations, of which the best fruits are: 'The Crisis of the Reformation' (1845); 'Feudalism and Aristocracy' (1858); and the masterpiece 'Ancient History' (1852-7).

Dun'combe, Thomas Slingsby, English politician: b. 1796; d. 13 Nov. 1861. He was

elected member of Parliament for Hertford in 1824, assisted in carrying the Reform Bill, and became prominent in the extreme Liberal party. In 1842 he presented the Chartist petition, signed by 3,000,000 of the lower classes, in favor of universal suffrage, vote by ballot, short Parliaments, etc. In 1842 the then home secretary having sanctioned the opening of the letters of Mazzini, Duncombe, in the House of Commons, denounced, with scathing invective, the adoption of the post-office spy system on English soil. He was an earnest advocate of Jewish emancipation; and his motion, 1858, for placing Baron Lionel Rothschild on a committee of the House of Commons was soon followed by the concession of the right of Jewish members to sit in the House of Commons.

Dundalk, dūn-dāk', Ireland, a maritime town, capital of the county of Louth, on Castle-town River. It is an ancient place, and in the battle of Faughart (1318) fought in its vicinity, Edward Bruce, the brother of King Robert Bruce of Scotland, was slain. It manufactures ropes and castings, and the trade, chiefly in cattle and agricultural produce, is extensive. Pop. (1901) 13,067.

Dundas', Henry, VISCOUNT MELVILLE, Scottish statesman: b. Edinburgh 28 April 1742; d. 28 May 1811. He studied at the University of Edinburgh and in 1766 was appointed solicitor-general for Scotland. In 1782 he was appointed treasurer of the navy and made a member of the privy council; but he continued only a short time in office. In 1791 he was made home secretary, and in 1794 became secretary of war. In 1804 he was appointed first lord of the admiralty under Pitt. Next year he was impeached, before the House of Lords, "of high crimes and misdemeanors" in his former office of treasurer of the navy. As the evidence adduced against him did not directly implicate him in the malversation proved against his deputy, he was acquitted. He was long practically the manager of Scottish affairs, and also of those of India.

Dundas', Robert, LORD ARNISTON, Scotch judge, b. 9 Dec. 1685; d. 1753. He was admitted to the Edinburgh bar in 1709, and soon became known as a successful lawyer with forcible and ingenious methods of reasoning. In 1717 he received the appointment of solicitor-general, a crown appointment, which was followed by advancing positions until in 1737 he became a judge, and in 1747 rose to the dignity, which he retained until his death, of lord president of the court of sessions of Scotland. His eldest son, ROBERT, b. 18 July 1713, d. Edinburgh 13 Dec. 1787; was educated at Edinburgh University, studied law at Utrecht and Paris; in 1737 gained admittance to the Scottish bar, and, like his father, rose through successive crown positions to that of lord president of the court of sessions of Scotland, which he attained in 1760 and occupied until his death.

Dundas, Canada, a town in Wentworth County, in the province of Ontario; situated on a bay at the western extremity of Lake Ontario. It is a manufacturing and shipping centre. Pop. (1901) 3,173.

Dundas Island, an island on the coast of British Columbia, separated from the most southerly of the islands of Alaska by Chatham Sound.

DUNDAS ISLANDS—DUNGLISON

Dundas, or **Juba**, Islands, are a group of about 500 coral islets off the east coast of Africa in lat. 1° S. The group has one safe anchorage.

Dundas Strait, a passage about 20 miles wide, separating Melville Island from Coburg Peninsula in northern Australia.

Dundee, Viscount of. See GRAHAM, JOHN.

Dundee, Scotland, a flourishing borough and seaport in county Forfar, on the Tay, 8 miles from the sea, and 37½ miles north-east of Edinburgh. Dundee in former times was the scene of many battles. Gen. Monk (1651) burned the place and massacred 1,000 of its inhabitants. It has a fine harbor, and splendid docks, and manufactures osnaburgs and other coarse linens, canvas and bagging for export, and colored threads and gloves. Dundee possesses many shipyards, sugar refineries, tanneries, and machine shops. Its linen trade is the largest in Great Britain. Pop. (1901) 160,871.

Dundonald, Thomas Cochrane, 10TH EARL OF. See COCHRANE, THOMAS.

Dundrear'y, Lord, a prominent character in Tom Taylor's well-known comedy of 'Our American Cousin.' The part originally contained but 47 lines, but it was enlarged by the actor, E. A. Sothorn, who became famous in this role.

Dune, dūn, a low sand-hill; an accumulation of sand; a hill-fort, or a regular building commonly called a Danish fort. Sand dunes are made by the blowing of sand, this material having been produced by the grinding down of rocks under the influence of breakers on the seashore or coast, or any similar agency. Such sand dunes in many places skirt the shores of Holland, Great Britain, Spain, and other countries, in some places encroaching on and covering what once was cultivated land. Originally the "downs" of England were similar to the dunes. The dunes along the Atlantic coast of the United States have changed materially the form of the coast line; some of these dunes are high hills, and still higher hills are on the coast of some of the islands of the Bahamas.

Dune Plants, plants characteristic of dunes, those somewhat unstable sandy areas formed under the influence of wind. The species capable of withstanding these conditions are few in number and are marked by well developed underground parts, including extensive root and numerous root-hairs, and storage organs, especially rhizomes. They are capable also of being partially buried, without apparent injury. Since some dunes are migratory, or tend to extend over wider and wider areas, thus destroying the natural vegetation, crops, and even orchards and forests, these plants are of special interest. Some of them, especially marram or beach grass, also known as sand reed (*Ammophila arenaria*), are widely planted upon beaches and dunes, to hold the sand and prevent its being blown by the wind. The United States Department of Agriculture, through its division of agrostology, has done immense service to land-owners along the shores of both the Great Lakes and the ocean coasts, in the planting of soil-binding grasses, as the plants are called. In time the planted areas support other vegetation and the dune may be consid-

ered conquered. On the other hand, should the dune advance it may disclose in its wake the remains of the vegetation it had buried. In western Michigan sand dunes have buried many peach orchards. In general the vegetation characteristic of dunes consists of xerophytes (q.v.), but the xerophytic character is due to the shifting of the sand and not to the conditions of growth. See DISTRIBUTION OF PLANTS.

Dunedin, dūn-ē'dīn or dūn-ēd'īn, New Zealand, town, capital of the province of Otago; on Otago harbor. It is about nine miles from its port, Port Chalmers, with which it is connected by railroad. Gold discovered nearby in 1861 has caused the recent rapid growth of the town. Wool and gold are the staple exports. Pop. (1901) 24,886; including suburbs, 52,390.

Dunfermline, Scotland, a town in Fife, 16 miles northwest of Edinburgh. It is a place of antiquity, from 1057 till 1650 a frequent residence of Scotland's kings, and for more than two centuries their place of sepulture. It was here that Charles II. signed the Covenant in 1650. Some of the prominent institutions now in the town are the Carnegie Library and the Carnegie Baths, the schools and the churches. Pop. (1901) 25,250.

Dung-beetle, a name borne by several lamellicorn beetles, of the genera *Aphodius*, *Bolbocer*, *Copris*, *Geotrupes*, *Phaneus*, and others. These beetles nest and lay their eggs in the droppings of cattle, and are found throughout America, Europe, Asia, and Africa. An African species is the sacred scarabæus of Egypt (*Ateuchius sacer*).

Dungar'van, Ireland, a municipal borough and seaport in the county of Waterford. It is a resort for sea-bathing. Its ancient castle, situated in the centre of the town, is now used as a barrack. The harbor is shallow and there is little trade. Fishing is the chief occupation. Pop. (1901) 4,850.

Dungeness, dūnj'nēs, a headland on the south coast of Kent, 11 miles southeast of Rye. It has a fort and government lighthouse.

Dunglison, dūng'lī-sōn, **Richard James**, American physician: b. Baltimore, Md., 13 Nov. 1834; d. Philadelphia 4 March 1901. He was a son of Robley Dunglison (q.v.). He was graduated at the University of Pennsylvania 1852, and from Jefferson Medical College 1856. During the Civil War he served as surgeon in the Philadelphia military hospitals. He soon gave up the practice of medicine in order to devote himself to literary work and it is by his contributions to medical literature that he is best known, having edited the 'College and Clinical Record' 1880-99, and written constantly for the leading medical journals. He was also one of the original editors of the Philadelphia 'Medical Times.' He revised and edited the following works of his father: 'History of Medicine' (1872), and 'Medical Lexicon' (1874); translated Guersant's 'Surgical Diseases of Children' (1873); and was author of: 'The Practitioner's Reference Book' (1878); 'Elementary Physiology' (1879); 'The Present Treatment of Disease' (1886).

Dunglison, Robley, American physician: b. Keswick, England 4 Jan. 1798; d. Philadelphia 1 April 1869. He was educated in medicine at London and Erlangen, and appointed professor

DUNITE — DUNKIRK

of medicine in the University of Virginia in 1824. In 1833 he was elected to the chair of therapeutics in the University of Maryland, and in 1836 professor of the institutes of medicine in the Jefferson Medical College of Philadelphia. He published about 20 volumes treating of subjects connected with medical science. They were widely circulated and highly valued in their day, one of them, a 'Dictionary of Medical Science and Literature,' being republished as late as 1874.

Dun'ite, a heavy, dark, very basic igneous rock of the peridotite group. It contains no felspar and consists essentially of olivene and chromite. It is believed that most workable deposits of chrome iron ore were formed by local segregations of chromite in a cooling dunite magma, at least the chromite deposits of North Carolina probably had such an origin. Dunites in common with other rocks of the peridotite group change readily to serpentine, and most deposits of chromite occur in serpentine. See PERIDOTITE.

Dun'kards, Dunkers, or Tunkers (Ger. *tunken*, to dip, Lat. *tingere*, Gr. *τέγγειν*) a sect of German-American Baptists, founded by Alexander Mack in 1708 in Westphalia. Persecution at home drove them across the Atlantic. Their doctrines resemble those of the Mennonites (q.v.). They derive their name from their mode of baptizing by immersion. They reject infant baptism; use great plainness of dress and language; refuse to take oaths or to fight; and anoint the sick with oil in order to effect their recovery, depending on this unction and prayer, and rejecting the use of medicine. Every brother is allowed to speak in the congregation, and their best speaker is usually set apart as their minister, ordaining him by the laying on of hands, attended with fasting and prayer. They also have deacons, and aged women for deaconesses. From among the teachers who have been tried, they choose bishops. An elder among them is, in general, the first or oldest chosen teacher in a congregation which has no bishop. Their annual meeting, which is held about Whitsuntide, is attended by the bishops, teachers, and other representatives chosen by the congregations. The important cases brought before these meetings are, in general, decided by a committee of five of the oldest bishops. They will not go to law, and until lately the taking of interest on money was not allowed among them. They celebrate the Lord's Supper, with its accompanying usages of love feasts, the washing of feet, the kiss of charity, and the right hand of fellowship. They believe in general redemption, though it is with them not an article of faith; but they deny that they are Universalists. From the Dunkers, as a sect, must be distinguished the Seventh Day Dunkers, also called the German Seventh Day Baptists. They were established by Conrad Beissel, a native of Germany, who had been educated for the ministry at Halle. When a member of the Dunker society at Mühlbach (Mill Creek), in Lancaster County, Pa., he published (1725), a tract, to prove that the seventh day, and not the first day, was established by Jehovah for ever as the Sabbath. This created some disturbance in the society at Mill Creek, upon which he retired from the settlement and went secretly to a hermitage on the banks of the Cocalico. Having been discov-

ered, and joined by many of the society at Mill Creek, who settled around him in isolated cottages, the first community of Seventh Day Dunkers was established in 1728. In 1733 a monastic society was established, constituting with the buildings subsequently erected by the community, the irregular enclosed village of Ephrata. The habit of the capuchins or white friars was adopted by both the brethren and sisters. Monastic names were given to all who entered the cloister. In 1740 there were 36 single brethren in the cloister and 35 sisters, and at one time the society, including the members living in the neighborhood, numbered nearly 300. The property which belonged to the society by donation, and the labor of the single brethren and sisters were common stock; but none were obliged to throw in their own property or give up any of their possessions. They considered celibacy a virtue, but never required it, nor did they take any vows in reference to it. When two wished to be joined in wedlock, they were aided by the society. In the earlier days the idea of a universal restoration existed among them; but it has never been taught as an article of faith, and is always approached with caution. The Dunkards in this country have dispersed themselves through almost every State of the Union, especially Pennsylvania, Maryland, Virginia, Ohio, and Indiana. In 1900 they reported 2,998 ministers; 1,129 churches; and 111,481 communicants. See GERMAN BAPTIST BRETHREN.

Dunkin, Edwin, English astronomer: b. Truro 19 Aug. 1821; d. 26 Nov. 1898. In 1838 he joined the staff of the Royal Observatory at Greenwich, becoming in 1881 chief assistant, a post which he resigned in 1884. In 1845 he was elected a Fellow of the Royal Astronomical Society, and in 1876 of the Royal Society. From 1884 till 1886 he acted as president of the former body. He published several works, among which are: 'On the Movement of the Solar System in Space determined from the Proper Motions of 1,167 Stars' (1863); 'On the Probable Error of Transit Observations' (1860-64); 'The Midnight Sky: Familiar Notes on the Stars and Planets' (1869); 'Obituary Notices of Astronomers' (1879).

Dunkirk, dūn'kèrk (Fr. *Dunkerque* or *Dunquerque*), France, town in the department of Nord, on the coast of the North Sea, 40 miles northwest of Lille, at the junction of several canals. Of the public squares, that of Champ de Mars and that adorned by a statue of Jean Bart (1845) are the most noteworthy. There are several interesting churches, among the chief being the church of St. Eloi, built about 1560, with a fine tower about 300 feet high, now used as a belfry; the chapel of Notre-Dame des Dunes, founded in 1405 and restored in 1815; and the convent and church of St. Jean-Baptiste. Dunkirk is well protected by several forts, both on the land side and on that of the sea. Its manufactures are extensive, comprising fishing-nets, ropes, sail-cloth, straw hats, starch, soap, leather, earthenware, oil, and chemicals, besides distilling, sugar-refining, and other industries. Dunkirk is the chief port of departure of the French Iceland fishing fleets. The trade is extensive and important. Dunkirk was a town under its present name, which means "the

DUNKIRK — DUNN

church of the dunes," in the 9th century. It has played a prominent part in many wars, and has been besieged on many occasions. The present commercial importance of Dunkirk dates from the period of the second empire. One of the most famous natives of the town is Jean Bart (1651-1702), the celebrated seaman. Pop. 49,215, with the suburbs Rosendael and Saint-Pol-sur-Mer, about 55,000.

Dunkirk, N. Y., city in Chautauqua County; on Lake Erie, and the Erie, the Nickel Plate, the Lake Shore, the Western N. Y. & P., and the Dunkirk, All. V., and P. R.R.'s; 40 miles southwest of Buffalo. It is a good shipping port, having a good harbor and facilities for freight handling. Its industries include a plant for the manufacture of locomotives, foundry, planing-mills, grain-mills, grain and coal elevators, and various other factories. It is a popular summer resort, with a beautiful park overlooking Lake Erie, and has a public library, orphan asylum, public and parish schools, and a national bank. Pop. 12,500.

Dunlap, William, American dramatist and painter: b. Perth Amboy, N. J., 19 Feb. 1766; d. New York 28 Sept. 1839. He painted George Washington's portrait and for five years (1784-9) worked under West in London. Returning to America he wrote several successful plays, including: 'The Father' (1789), a comedy; 'Leicester' (1794), a tragedy; 'André' (1798), a tragedy. He also published: 'Life of George Frederick Cooke' (1813); 'Life of Charles Brockden Brown' (1815); 'History of the American Theatre' (1832); 'History of the Rise and Progress of the Art of Design in the United States' (1834); and similar works. He was one of the founders of the National Academy of Design.

Dunlin (*Tringa alpina*), a bird of the genus to which the least and pectoral sandpipers, knot, and stint belong. It is smaller than the common snipe; is in winter ashy-gray above, white below, with dark spots on the breast; in the breeding season it is mottled with rufous above and the breast is crossed with black. The straight bill is adapted for boring in soft soil, and its cavity reaches to the extremity, not, as in the snipe, stopping short of the tip. The dunlin is one of the most common shore birds in northern Europe and Asia, and sometimes wanders into North America, where it is replaced by the closely allied redbacked sandpiper. In Scotland there are several local varieties, those of the east being a half larger than those of the Hebrides. It breeds on moors and marshes along with the snipe and plover, returning after the breeding season to the sandy and muddy reaches of the coast. See SANDPIPER.

Dunlop, George Thomas, American capitalist: b. Otterburn, Frederick County, Md., 25 March 1845. He entered business at 15, and set up for himself as G. T. Dunlop & Co. in 1870, retiring from business with a fortune in 1890. He was for many years director of the Washington & Georgetown Railroad Company, of which he was elected president in 1894. When this company obtained extensive new franchises from Congress, and changed its name to the Capital Traction Company in 1895, he was elected president of the new corporation.

Dunmore, John Murray, EARL OF, English colonial governor: b. 1732; d. Ramsgate, England, May 1809. He was appointed governor of New York in 1770, and governor of Virginia in 1771. He dissolved the Virginia Assembly in 1772, and again in 1774 when it had resolved to keep the day of the closing of the port of Boston as a day of fasting and prayer. In 1775 he removed a powder magazine to one of the English war ships, and the people incensed at this, began armed resistance under the leadership of Patrick Henry. Dunmore was forced shortly after to take refuge on his fleet, and kept up a predatory warfare against the colonists, burning Norfolk in 1776. He was driven from his position on Gwynn's island and finally sent the fleet to the West Indies, and returned to England. He was appointed governor of the Bahamas in 1786. See COLONIAL WARS IN AMERICA.

Dunmore, Pa., a borough in Lackawanna County, on the Erie & L. R.R.; two miles northeast of Scranton. It is the centre of a coal mining district, and has manufactures of silk, iron, and brick. Several public institutions are located here, the principal one being the State Oral School for the deaf and dumb. Pop. 12,600.

Dun'mow, Great and Little, two parishes of England, in the county of Essex. The former contains the market-town of Great Dunmow, on a height above the Chelmer, 32 miles northeast of London. At Little Dunmow are remains of a stately Augustinian priory, founded in 1104. The Dunmow flitch of bacon was a prize instituted in 1244, by Robert Fitzwalter, on the condition "that whatever married couple will go to the priory, and kneeling on two sharp-pointed stones, will swear that they have not quarreled nor repented of their marriage within a year and a day after its celebration, shall receive a flitch of bacon." The prize was first claimed in 1445, 200 years after it had been instituted. After 1751, up to which date only five presentations had taken place, the flitch was not again claimed till 1855; between 1860 and 1877 there were four awards; and three in 1891.

Dunn, Gertrude Colmore Renton, English novelist. She was educated in Germany and Paris, and in 1882 was married to H. A. C. Dunn. After his death she was married in 1901 to H. B. Weaver. She has published: 'Concerning Oliver Knox' (1888); 'A Conspiracy of Silence' (1889); 'A Living Epitaph' (1890); 'A Valley of Shadows' (1892); 'A Daughter of Music' (1894); 'Poems of Love and Life' (1896); 'Love for a Key' (1897); 'Points of View' (1898); 'The Strange Story of Hester Wynne' (1899); 'The Marble Face' (1900).

Dunn, Jacob Piatt, American journalist and author: b. Lawrenceburg, Ind., 12 April 1855. He was educated at Earlham College, Ind., and Michigan University, and was State librarian of Indiana 1889-93, when he became an editorial writer on the Indianapolis *Sentinel*. Since 1886 he has been secretary of the Indiana Historical Society. He has published: 'Massacres of the Mountains, a History of the Indian Wars of the Far West' (1886); 'His-

tory of Indiana' (1888), in the 'American Commonwealth Series'; 'The Tax Law of Indiana and the Science of Taxation' (1891); 'The Libraries of Indiana' (1892); 'The World's Silver Problem' (1894).

Dun'nage, a nautical term applied to loose wood or other miscellaneous substances, used in the hold of a ship to lift the cargo above bilge-water. Again, such articles as old mats or sails stowed among casks and other cargo, to prevent their motion and breakage. See **CHOCKS**.

Dunne, Edward Joseph, American Roman Catholic clergyman: b. Tipperary, Ireland, 1848. He came to the United States when an infant, was educated at the theological seminary in Baltimore, and ordained priest in 1871. He was appointed bishop of Dallas, Texas, in 1893. His diocese grew steadily under his administration till in 1900 it contained 32 churches and 21 parochial schools.

Dunne, Finley Peter, American journalist and humorist: b. Chicago 10 July 1867. He was educated in the Chicago public schools and entered journalism in 1885. He was city editor of the *Chicago Times* 1891-2; was on the editorial staff of the *Chicago Evening Post* and *Times-Herald* 1892-7; and editor of the *Chicago Journal* 1897-1900. He is author of 'Mr. Dooley in Peace and War' (1898); 'Mr. Dooley in the Hearts of His Countrymen' (1898); 'Mr. Dooley's Philosophy' (1900); 'Mr. Dooley's Opinions.'

Dun'net Head, a promontory of Scotland, in Caithness, at the western entrance of, and projecting into the Pentland Firth; the most northern point of the mainland of Great Britain. It rises to the height of 400 feet above sea-level. On the northwestern extremity is a lighthouse 346 feet high.

Dunning, Edwin James, American author: b. Camillus, N. Y., 19 July 1821; d. Cambridge 1901. He practised dentistry at Ithaca and Syracuse, N. Y., 1838-44, and in New York 1844-74. In 1877 he lost his eyesight and took up the study of literature. He published: 'Genesis of Shakespeare's Art: a Study of His Poems and Sonnets' (1897).

Dunning, John, (BARON ASHBURTON), English lawyer: b. Ashburton, Devonshire, 18 Oct. 1731; d. Exmouth, Devonshire, 18 Aug. 1783. He established his reputation in 1762 by drawing up a defense of the East India Company against the claims of the Dutch; and his already large practice was immensely augmented by his arguments on the side of Wilkes in the question of the general warrants. In Parliament he remained a firm opponent to the ministry who conducted the American war; and on the return of Lord Shelburne to power in 1782 he was made chancellor of the duchy of Lancaster, and advanced to the peerage.

Dunning, William Archibald, American educator: b. Plainfield, N. J. He was graduated at Columbia 1881, and became successively fellow 1886-8; prize lecturer in political science 1887-9; instructor in history 1889-91; and professor of history and lecturer on political theory since 1891. In 1894 he became managing editor of the 'Political Science Quarterly,' to which he has contributed over 60 important articles and reviews. He has pub-

lished: 'Essays on the Civil War and Reconstruction, and Related Topics' (1898); 'History of Political Theories, Ancient and Mediæval' (1902).

Dunnottar, dūn-nōt'tar, a parish of Kincardineshire, Scotland, famous for its ancient ruined castle. The older part of the ruins probably belongs to about 1394, when the castle was rebuilt by Sir William Keith, marischal of Scotland. During the Commonwealth the castle was selected as the strongest place in the kingdom for the preservation of the Scottish regalia. Lambert, one of Cromwell's generals, besieged the place, which was starved into capitulation. The regalia had, however, been previously removed by a stratagem, in which Mrs. Granger, the wife of the minister of an adjoining parish, played the chief part. She brought away the crown hid among some clothes in her lap, her servant-maid carrying the sword and sceptre in a bag of flax on her back. In Dunnottar churchyard, near Stonehaven, Sir Walter Scott met Robert Paterson, the original 'Old Mortality.'

Dunois, Jean, zhōn dū-nwā, COUNT OF ORLEANS and OF LONGUEVILLE, French soldier: b. Paris 23 Nov. 1402; d. St. Germain-en-Laye, near Paris, 24 Nov. 1468. He was a natural son of Louis, Duke of Orleans, and made the name "Bastard of Orleans" illustrious by his military exploits in the war for the liberation of France, then completely in the power of England. Being besieged by the English he defended Orleans with the greatest courage until relieved by the Maid of Orleans. To Dunois belongs almost entirely the honor of expelling the enemies of his country from Normandy and Guienne. In 1450 he had completely freed France from the presence of the English, and it may truly be said that Charles VII. was indebted to him for his crown. Dunois received from him the title of "deliverer of his country," the county of Longueville, and the dignity of high chamberlain of France.

Dunoon, dūn-oon', Scotland, a celebrated watering-place in the county of Argyll, on the shore of the Firth of Clyde, 25 miles west by north from Glasgow. There is an immense passenger traffic here in the summer season carried on by means of the Clyde steamers. On a hill are the ruins of Castle Dunoon, the ancient residence of the Argylls.

Dunquerque. See **DUNKIRK**.

Dunra'ven, Windham Thomas Wyndham-Quin, 4TH EARL OF: b. Adare, Ireland, 12 Feb. 1841. He was educated at Christ Church, Oxford; was war correspondent for the *Daily Telegraph* in Abyssinia in 1867 and again in the Franco-Prussian war, and succeeded to the title in 1871. He was under-secretary for the Colonies in Lord Salisbury's two administrations, but resigned in 1887. He is a traveler and yachtsman and has published: 'The Great Divide: the Upper Yellowstone' (1874); 'The Irish Question' (1880); 'Self Instruction in the Theory and Practice of Navigation' (1900).

Duns, John, Scottish physicist: b. 11 July 1820. He was educated at Edinburgh University and entered the ministry of the Free Church of Scotland in 1843. He was pastor at Torphichen in 1844; editor of 'North British Review' (1857), and has been professor of natural sci-

ence in New College, Edinburgh from 1864. Among his published works are: 'Things New and Old' (1857); 'Biblical Natural Science' (1863-6); 'Science and Christian Thought' (1866).

Dunsinane, dūn-sī-nān', one of the Sidlaw Hills in Perthshire, 1,012 feet high, nine miles northeast of Perth. On its top are remains of a fortress "Macbeth's Castle." Here Siward defeated Macbeth in 1054. Shakespeare made use of this battle in his 'Macbeth.'

Dun'stan, Saint, English prelate and statesman: b. Glastonbury about 924; d. Canterbury 19 May 988. His family was a notable one and related to the royal line of the Anglian kings. He was educated in whatever of science and liberal arts existed in that time, by certain Irish monks settled at Glastonbury, and he was proficient in music (including music composition), in painting, and the mechanic arts. His career proves him to have been gifted with administrative talents of the first order. At an early age he entered the service of King Athelstan and continued in that of his successor Edmund, but his superior accomplishments provoked the enmity of his rivals at court, by whom he was set upon with outrageous violence and driven out. He then went to his uncle, Ælphæa, bishop of Winchester, and when convalescent from an attack of brain fever brought on by the rough handling to which he had been subjected, took the religious vows and became a monk. He now entered upon a course of asceticism, such as was in that age deemed to be the most perfect way to heaven and an essential part of the life of whoever would walk in Christ's footprints; and hence from the time of the change of religion in the 16th century until lately Dunstan has been rated by those outside of the Roman Catholic Church merely as a fanatical and grossly superstitious monk, and his wisdom as churchman and statesman reputed as "monkish cunning." But modern historic research has begun to do justice to this man, who was without question an enlightened statesman and a wise Church reformer.

At the age of 22 he was made abbot of Glastonbury by King Edmund, who also appointed him principal state treasurer. Under Edmund's successor Edred (946-55), who was of feeble constitution, Dunstan was in all but name ruler of the kingdom and a wise and vigorous administrator. Under Edwy, who succeeded Edred, he courageously sought out the king while he was in the company of his destined bride, Elgiva, and to his face denounced the intended union as incestuous. For this action he was outlawed and for a few months was in exile at Ghent; but when Edwy's brother Edgar, a youth, became king of Mercia and Northumberland, he chose Dunstan for his chief minister and at the same time he was appointed bishop of Winchester; in 960 he was promoted to the primatial see of Canterbury. Now it was that Dunstan, as archbishop of Canterbury and principal minister of state, began to execute fully the policy for which his memory has been execrated in modern times. He forcibly expelled from all abbeys, cathedrals and churches to which his power as minister of state extended, all married and concubinary priests, supplanting them with monks where he could; and making the canons of his own cathedral chapter a mo-

nastic college. In dispossessing the married clergy he simply enforced the laws of the Church which required her ministers to be celibate; and in reforming his cathedral chapter he appears to have exercised a wise discretion; there were evils rampant in the Church in those times that cried out for stern correction. In that same reign, in which he was all-powerful, he induced the king to visit in person every part of his realm annually, holding courts of justice, hearing appeals, and becoming acquainted with the needs of the people. A strong fleet was maintained off the coast against the Norse pirates; the coinage was reformed; rewards were paid by the Crown for the extermination of beasts of prey. Edgar's successor, Edmund, owed chiefly to Dunstan his elevation to the throne, and the archbishop continued still to be principal minister of state; but when Edmund was murdered, 979, the archbishop's influence under his successor, Ethelred, "the unready," was small, and disasters befell the kingdom thick and fast; the Danes ravaging the coasts and pillaging and slaughtering the people inland. The archbishop passed the closing years of his life in retirement, going back to the favorite studies and pursuits of his youth—music, painting, calligraphy, the making of musical instruments, and bell-founding. Consult: Stubbs, 'Memorials of Saint Dunstan'; Butler, 'Lives of the Saints'; Starr, 'Patron Saints'; Osborn; Eadmer.

Dun'ster, Henry, 1st president of Harvard College: b. Lancashire, England, about 1612; d. Scituate, Mass., 27 Feb. 1659. He was inaugurated president Aug. 27, 1640, and held his office until 1654, when, having become a supporter of the principles of the modern Baptists, he was persuaded to resign his office. He was respected as a modest and pious man, and esteemed an excellent Oriental scholar.

Dunton, John, English bookseller and author: b. Graffham, Huntingdonshire, 4 May 1659; d. 1733. He came to New England in March, 1686, with a cargo of books and remained about eight months. He conducted a weekly called the 'Athenian Mercury,' resolving all the curious questions proposed by the inquiring, of which 20 volumes appeared. A selection from this was made, called the 'Athenian Oracle.' He wrote voluminously on religion, ethics, and politics, filling his works with information which is no less entertaining for being subservient to the author's vanity. Among his writings are: 'Life and Errors of John Dunton'; and 'Letters from New England,' which was published in 1867. In this he relates many curious facts in relation to the bookselling business, describing the ministers, booksellers, and other citizens of Boston and Salem.

Dunwoody, Henry Harrison Chase, American meteorologist: b. Highland County, Ohio, 23 Oct. 1842. He was graduated at the U. S. Military Academy in 1866 and from the Columbia Law School in 1876 and having been detailed in 1872 for duty on the Signal Corps, was appointed in 1891 to the Weather Bureau, then first constituted. His special work has been that of formulating official forecasts of the weather, and he originated the system of cold-wave warnings; in this connection he recommended the organization of State weather services. He is the author of many papers on

meteorological subjects published by the Signal Service.

Duodec'imal Scale. See ARITHMETIC; SCALE.

Duodecimal System, in numeration, a system of numbers the scale of which is 12. Duodecimals is a term applied to an arithmetical method of ascertaining the number of square feet, etc., in a rectangular area or surface, whose sides are given in feet, inches, and lines. In recent times it has been proposed to substitute for the present decimal scale of 9 digits and a cipher a duodecimal scale of 11 digits and a cipher, thus making 12 its base. In favor of the system it is urged that 12 admits of a greater number of division into equal parts by 2, 3, 4, and 6; but most mathematicians consider it as not having sufficient superiority over decimals to counterbalance the immense inconvenience of making a change. The great superiority of duodecimals in the practical, everyday affairs of trade, commerce, and ordinary business is so great, that no laws in any manufacturing or commercial country can be made that can compel the use of decimals to the displacing of dozens and grosses.

Duodenitis, dü-ō-dē-nī'tis, a term used in pathology, is inflammation of the duodenum, the first portion of the small intestine. It frequently results from an acute gastric irritation and is, in a large number of cases, the affection which causes biliousness. The main symptoms are headache, languor, nausea, loss of appetite, constipation, coated tongue, foul breath, and, at times, a certain amount of jaundice. This latter is due to the fact that the inflammation in the duodenum causes a swelling of the mucous membrane of the common bile duct and leads to partial occlusion of its passage, thus damming back a certain amount of bile, hence the term biliousness. The treatment is by means of careful diet, hot water and hygienic living. See INTESTINE; ENTERITIS.

Duodenum, dü-ō-dē'nūm, in anatomy. See INTESTINE.

Dupanloup, Félix Antoine Philibert, fā-lēks ān-twān fē-lē-bēr dü-pān-loo, French prelate and theologian: b. St. Félix, Savoy, 3 Jan. 1802; d. Lacombe, Isère, 11 Oct. 1879. He received a clerical education at Paris and after ordination to the priesthood was appointed chaplain to the Count of Chambord and religious instructor of the young princes of the house of Orleans. In 1837 he was made one of the vicars-general of the archbishop of Paris and head of the Petit Séminaire de St. Nicolas du Charbonnet which, under his direction, ceasing to be merely a preparatory school for aspirants to the clerical state, received as students the sons of the highest nobility. Ernest Renan, who was one of the clerical students, recounts in his 'Recollections of My Youth' a pleasing anecdote illustrating "the noblest trait in Dupanloup's character," his affection for his mother. It was Dupanloup who in 1838 attended Talleyrand on his death bed as minister of religion, and brought about what passed for a reconciliation of the apostate bishop with the Church. Renan reports Talleyrand as having remarked when told that the Abbé Dupanloup was to offer his ministration, "This young man does not know his business"; but in Renan's judgment "never was there priest so well up in his calling." All his

life Dupanloup took a lively interest in charitable projects and in measures for extending to the masses the benefits of school education. He combated the endeavors of that party in the Church which sought to displace in institutions of higher education the ancient Greek and Latin classics as being pagan, and to substitute in their room the Fathers of the Church—the Basils, the Chrysostoms, the Augustins and the Jeromes. He was made bishop of Orleans 1849; was elected to the French Academy 1854; but withdrew in 1871 when against his earnest protest Littré, the leader of the Positivists, was chosen to be a member; that same year he was elected to the National Assembly and was several times re-elected; in the Assembly he was the leader of the clerical party, so-called, and ever took an active part in discussions of matters of public education. In the Vatican Council he stood with the minority in opposition to the decree of infallibility, but was one of the first to make an act of submission. Nominated 1871 to be archbishop of Paris, he declined that office. He was a great pulpit orator, worthy of a place beside the great sacred orators of France. His writings are voluminous, dealing almost wholly with questions of education and church interests. Two of his works which are in every good pedagogical library are: 'The Child' and 'The Ministry of the Catechist.' Consult: Pelletier, 'Monseigneur Dupanloup.'

Dupaty, Charles Marguerite Jean Baptiste Mercier, shārl mār-gā-rēt zhōn bāp-tēst mār-sē-ā dü-pā-tē, French jurist: b. La Rochelle, France, 9 May 1746; d. Paris 17 Sept. 1788. In 1767 he became advocate-general to the parliament of Bordeaux, and having written in its name against the Duke of Aiguillon, when this nobleman became minister (1770) he was sent to Pierre-en-Cise (a fortress at Lyons, once a state prison), and afterward banished until the accession of Louis XVI. The memorial by which he preserved the lives of three innocent citizens of Chaumont who were condemned to the wheel deserves particular mention. His other works are: 'Reflexions Historiques sur les Loix Criminelles,' a valuable work; various 'Discours Académiques'; and 'Lettres sur l'Italie en 1785,' which appeared in 1788.

Dupaty, Louis Marie Charles Mercier, loo-ē mā-rē shārl mār-sē-ā, French sculptor: b. Bordeaux 29 Sept. 1771; d. Paris 12 Nov. 1825. He was a son of the preceding. He was the restorer of sculpture in France, a member of the Institute, and professor in the École des Beaux Arts; was at first an advocate, served during the Revolution as a dragoon, then as cartographer, and finally went to Rome, where he studied sculpture and made himself known by numerous works. His principal productions are 'Ajax Pursued by Neptune,' his equestrian statue of Louis XIII. (1816), and 'Orestes Pursued by the Furies.'

Duperré, Victor Guy, vĕk-tōr gē dü-pĕ-rā, BARON, French naval officer: b. La Rochelle 20 Feb. 1775; d. Paris 2 Nov. 1846. After various gallant naval adventures Duperré in 1811 was raised to the rank of vice-admiral, and commanded in the Mediterranean. In the beginning of 1812 he was naval commander-in-chief in the Adriatic, and during the Hundred

Days guarded Toulon against the attempts of the British and Sicilian troops which landed at Marseilles. In 1823 he commanded the squadron employed in the siege of Cadiz. In 1830 he superintended the landing of the troops on the coast of Algiers, and contributed greatly to the capture of the capital. After the Revolution of July he was raised to the peerage, and held the portfolio of marine, first from 1834 to 1836, and again in the ministry of 1840.

Duperron, Jacques Davy, zhāk dā-vē dū-pě-rôn, French ecclesiastic: b. St. Lô, Normandy, 15 Nov. 1556; d. Paris 6 Sept. 1618. His father, a physician, having embraced the Reformed religion had to flee from France and settled at Bern in Switzerland, where he became a Protestant minister. The son, having received at Bern a superior education, came to Paris at the age of 20, and having been there received into the Roman Catholic Church was appointed reader to the king, Henry III., and afterward adopted the clerical profession. He pronounced the eulogy of Mary Queen of Scots, after her execution, and seized the opportunity to make an attack on Queen Elizabeth; and though the French court disavowed any approval of the discourse and expressed a formal censure of it, the incident marked the beginning of the young ecclesiastic's good fortunes. In the matter of the Cardinal de Bourbon's plot to succeed to the throne after the death of Henry III., he was charged with having joined the Cardinal's faction and betrayed its secrets to Henry of Navarre (Henry IV.). The charge seemed to get confirmation from the fact that after Henry ascended the throne he made Duperron bishop of Evreux. He was the Church's agent in bringing about Henry's conversion to the Roman Catholic faith. In his diocese of Evreux he had great success in checking the advance of Calvinism and bringing seceders back to the Church. He was in Rome on the king's business in 1604 when Clement VIII. died, and was largely instrumental in securing the election first of Leo XI. and then of Paul V., who in less than a month succeeded Leo. He was now made archbishop of Sens and cardinal. Contrary to the principles of Gallicanism he was a zealous advocate of the doctrine of papal infallibility and of the Pope's superiority over a general council of the Church.

Dupetit-Thouars, dū-pě-tē too-är, **Abel Aubert**, French naval captain: b. Boumois, Saumur, 31 Aug. 1760; d. 1 Aug. 1798. When a mere boy he was so smitten with the love of a sea life by reading 'Robinson Crusoe' that he ran off from the military school of Laflèche and attempted to enter himself as a cabin-boy in a vessel at Nantes, but was discovered and sent back. At length, in 1778, he had an opportunity of entering the navy, and distinguished himself on several occasions in the West Indies. On the expedition to Egypt in 1798 he commanded an 80-gun ship. He foresaw the only result which could be anticipated if it was resolved to wait for Nelson's attack in the place selected in the roads of Aboukir, and advised immediately to set sail. But though his advice was disregarded he fought with undaunted valor against the enemy, and fell in the struggle. His MSS. and correspondence

were published under the title of 'Lettres, Mémoires et Opuscules d'Aristide Dupetit-Thouars.'

Dupin, André Marie Jean Jacques, än-drä mä-rē zhôn zhāk dü-pän, French lawyer and advocate: b. Varzy 1 Feb. 1783; d. Paris. He attained first rank at the French bar, defending Marshal Ney and Beranger. He was the eldest of the famous brothers styled "the three Dupins."

Dupin, Jean Henri, zhôn ön-rē, French dramatist: b. Paris 1 Sept. 1791; d. there 5 March 1887. He was a brother of André Dupin (q.v.). His plays were staged with great success.

Dupin, Louis Ellies, French church historian: b. Paris 17 June 1657; d. there 6 June 1719. In 1680 he received the degree B.D. at the Sorbonne, and in 1684 the degree D.D., and then or previously commenced those researches into the history of the Church which resulted in his celebrated 'Universal Library of all the Ecclesiastical Writers' (Vol. I., 1686). The freedom with which in this volume he discussed the teachings of the Fathers of the Church brought upon the work its condemnation by the archbishops of Paris and it was suppressed; but the author having made a retraction and changed "universal" in the title to "new," he was permitted to continue the series, though later he was banished, and restored only after a new retraction. He sought to effect a union between the Anglican and Gallican churches and had a correspondence to that end in 1718 with the Anglican primate, Archbishop Wake. He was now charged with endeavoring to subvert the dogmas of the Roman Catholic Church, and his papers were seized in 1719, in the expectation that they would give proof of the charge; but nothing was found that seriously compromised him. He seems to also have conferred with Peter the Great with a view to union of the Gallican and Russian churches. The 'Library of Ecclesiastical Authors' is a very voluminous work of immense erudition and is a complete history of theological literature within the Roman Catholic Church, both Eastern and Western, to the close of the 17th century; it was soon translated into English. Besides this, his greatest work, he wrote many others, among them: 'Universal Library of Historians'; 'Abridgment of Church History'; 'General History from the Beginning of the World to the Present Time' (1712).

Dupin, Pierre Charles François, pē-är shärł frän-swä, French engineer: b. Varzy 6 Oct. 1784; d. Paris 18 Jan. 1873. He was a brother of André and Jean Henri Dupin (qq.v.). He performed many notable engineering feats in the government service, and was made a baron and a senator.

Dupleix, Joseph François, zhō-zěf frän-swä dü-pläks, French colonial governor: b. Landrecies, France, 1 Jan. 1697; d. Paris 10 Nov. 1764. In 1720 he was appointed to a seat in the council at Pondicherry. Ten years later he became superintendent at Chandernagore in Bengal. The remarkable success of his administration here led to his being appointed, in 1741, governor-general of all the French Indies, with the title of Nawab. He now successfully pursued that policy of patient, skilful

DUPONCEAU — DUPONT

diplomacy among the native princes which at one time made the Carnatic almost a French province. When war broke out in Europe between France and England (1740), several brilliant engagements planned by Dupleix took place between the French garrison and the troops of the Nawab of the Carnatic, who endeavored to take possession of Madras, but was precipitately forced to raise the siege. An attack on the English at Fort St. David failed, but Dupleix's science and courage were displayed in the defense of Pondicherry, which Admiral Boscawen in vain attacked for five weeks, with an apparently overwhelming force, but was forced to retire discomfited, though the defense was conducted by a civilian, unsupported by a single general of repute. The ambitious mind of Dupleix had long formed the project of founding a French empire in India on the ruins of the Mogul monarchy, but his military designs, able as they were, were frustrated by the energy and military genius of Clive and Lawrence. The struggle continued till 1754, in which year Dupleix was recalled by Louis XV.

Duponceau, dü-pôn'sō, Fr. dü-pôn-sō, Peter Stephen, American lawyer and scholar: b. St. Martin, Isle de Ré, France, 3 June 1760; d. Philadelphia 1 April 1844. For a time he was secretary to Count de Gêbelin, and afterward to Baron Steuben, with whom he came to the United States in 1777. Receiving a captain's commission he served with Steuben through the American Revolution and after its close settled in Philadelphia and became noted as a lawyer. For several years he was much interested in an effort to introduce into the United States the production and manufacture of silk. His writings are of a miscellaneous character, among which may be mentioned original treatises on points of law; translations from the Latin, German, and French on similar subjects; various treatises on philology; numerous contributions to American history, including a translation of 'A Description of New Sweden,' by Thomas Campanius Holm. He was a member of more than 40 literary and scientific institutions of Europe and America, including the American Philosophical Society, the Historical Society of Pennsylvania, and the Philadelphia Athenæum, of which three institutions he was the presiding officer at the time of his death.

Dupont, dü-pönt', Henry Algernon, American military officer: b. Wilmington, Del., 30 July 1838. He is a grandson of E. I. Dupont (q.v.). He was graduated at the United States Military Academy, served through the Civil War, taking part in the battles of Piedmont, Lynchburg, Cedar Creek, Opequan, and Fisher's Hill, and was brevetted major-general for gallantry in the two last-mentioned battles, and lieutenant-colonel for services at Cedar Creek. He became proprietor of the celebrated powder mills bearing his name near Wilmington, Del., and under his direction they became an important factor in the Civil War. He resigned from the army in 1875; became president of the Wilmington & Northwestern Railroad Company in 1879; and was chosen United States senator from Delaware in 1895, but was not seated.

Dupont, Jacques Charles, zhāk shär'l dü-pôn, surnamed *De l'Eure*, French statesman: b. Neubourg, Normandy, 27 Feb. 1767; d. Rouge-Pierre, Normandy, 3 March 1855. In

1798 he was a member of the Council of the Five Hundred, which was dispersed by Murat on the 18th Brumaire. In 1811 he was nominated president of the court of justice at Rouen, and in 1813 vice-president of the corps législatif. On the restoration of the Bourbons Dupont signalized himself as a leader of the opposition. In 1830, after the revolution of July, he was made minister of justice, and after the fall of Louis Philippe became a member of the provisional government. On the accession of Napoleon III., in 1852, he ceased to take part in public affairs. Dupont was called by his political friends the "Aristides of French liberalism."

Dupont, Pierre, pê-är, surnamed *DE L'ETANG*, French soldier: b. Chabanais 14 July 1765; d. Paris 7 March 1840. He served first with the French Legion in the Dutch service, and in 1791 in the French army. By his skilful arrangements as a staff officer, he prevented Denmark from falling into the hands of the Duke of York, and was promoted to the rank of brigadier-general. After the proceedings of the 18th Brumaire, in which he took an active part, he was appointed head of the general état-major of the army of reserve assembled at the foot of the Alps, and distinguished himself in Italy at the battle of Marengo. In 1805 he joined the army in Germany, where he freed Marshal Mortier when hemmed in by a body of Russian troops. He was also very active in the campaign of 1806 against the Prussians, and in 1807 contributed by his skilful tactics to the victory of Friedland. In 1815 he was elected member of the Chamber of Deputies by the department of Charente, and retained his seat with some interruptions till the revolution of July.

Dupont, Pierre, French political song writer: b. Lyons 23 April 1821; d. St. Etienne 25 July 1870. After issuing a volume of poems in 1844, he went to Paris and obtained a place in the office of the secretary of the Institute. After the revolution of February 1848 he came forward as the minstrel of socialism, and proved obnoxious to the government which came into power in December 1852. He was condemned to be banished for seven years; but the intercession of his friends soon procured his release. After that event he spent a gay and careless life by the Rhone, penning and singing his ballads one day in the mansions of the rich and the next in the cottages or workshops of the poor. His songs, which brought him fame, did not bring him fortune, and he died comparatively poor. His works (songs and music) appeared in 1854 in four volumes 8vo.

Dupont, dü-pönt', Samuel Francis, American naval officer: b. Bergen Point, N. J., 27 Sept. 1803; d. Philadelphia 23 June 1865. During the Mexican war, being then a commander, he saw much active and gallant service on the California coast. In 1862 he was put in command of the South Atlantic blockading squadron, and was promoted to rear-admiral in Aug. 1862. He greatly contributed to the organization of the Naval School at Annapolis, and was the author of a very remarkable report on the use of floating batteries for coast defense.

Dupont, Victor Marie, American manufacturer: b. Paris, France, 1 Oct. 1767; d. Philadelphia, Pa., 30 Jan. 1827. He was a son

DU PONT DE NEMOURS — DUPRE

of Pierre Samuel Dupont De Nemours (q.v.), and entered the diplomatic service as attaché to the French legation in the United States in 1787; became secretary of legation in 1795 and was appointed French consul in Charleston, S. C., in the same year. In 1798 he was appointed consul-general of France in New York. He returned to France; withdrew from the government service and came to the United States in January 1800. He entered business in New York; removed to Wilmington, Del., in 1809, where he joined his brother and established a cloth manufactory. He was for a time a member of the Delaware Legislature, and a director of the Bank of the United States.

Du Pont de Nemours, Eleuthère Irénée, ā-lū-thār ē-rā-nā dū-pōn dē nē-moor: b. Paris 24 June 1771; d. Philadelphia 31 Oct. 1834; son of the French political economist Pierre Samuel Du Pont de Nemours. He was a pupil of Lavoisier and entered the royal powder mills at Essonne to familiarize himself with the manufacture of gunpowder with a view to succeed Lavoisier as superintendent of the government powder mills, but subsequently abandoned this in 1791 to take charge of the printing and publishing house established by his father in Paris. Being a supporter of King Louis XVI. he was in the utmost peril after 10 Aug. 1792, and after being three times imprisoned and having his printing house sacked and destroyed he emigrated with his father's family to the United States in 1799, arriving at New London, Conn., 1 Jan. 1800. Not long after his arrival attention was called to the poor quality of gunpowder then made in this country and he determined to enter into powder manufacture here. With this in view he returned to France January 1801 to procure at Essonne, plans and models of improved machinery, returning to the United States in August with some of the machinery. Thomas Jefferson, who was deeply interested in this development, urged that the works be built in Virginia, but owing to his views regarding slavery and its effect on the white race Du Pont was unwilling to make his venture either in Virginia or Maryland. In June 1802 he bought a tract of land with a fine water-power on the Brandywine River, near Wilmington, Del. On 19 July he arrived there with his family and began operations which were so successful that, at the time of his sudden death by cholera, his works were the largest of their kind in the country. Since his death they have been carried on by his sons and grandsons and are still among the largest gunpowder works in this country, while they are the centre of the industrial combination in this industry.

Dupont de Nemours, Pierre Samuel, French economist: b. Paris 14 Dec. 1739; d. near Wilmington 6 Aug. 1817. He lived almost unknown in Paris as a private man of letters till 1773, when his principles of philosophy and political economy set forth in his 'Les Ephémérides du Citoyen' excited the displeasure of the minister, Choiseul, and obliged him to leave France. Several foreign princes offered him a reception and conferred honors on him. He returned, however, to his native country and accepted a small place given him by Turgot, minister of finance. In 1782 and 1783, with Dr. Hutton, the English agent, he negotiated the basis of the treaty by which the independence

of the United States of America was acknowledged. As inspector-general of commerce and manufactures, and as a councilor of state, he afterward did much to encourage French industry. After the Directory was abolished he came to the United States in 1798. In 1802 he returned to France, but did not at that time take any office, notwithstanding the offers made him by Napoleon. After Napoleon's return from Elba he settled in the United States where his two sons had already become citizens. Besides various political treatises he is likewise the author of a French translation of the first three cantos of the 'Orlando Furioso.'

Dupont's Smokeless Powder, a hard-grained porous powder, composed of cellulose nitrate of medium nitration which has been formed into grains by suspending the cellulose nitrate in an aqueous solution of barium and potassium nitrates to which amyl acetate is added, stirring the gelatinized material in the fluid until the grains are formed and hardening them by steam until the amyl acetate is expelled. The grains may be separated by sifting into the various desired sizes and colored to meet any taste by the addition of a very small amount of an organic coloring matter. See EXPLOSIVES; POWDER.

Düppel, Germany, a fortified village in the province of Schleswig-Holstein, Prussia, on the coast of the Little Belt. The place has been the scene of some severe struggles between the Danes, to whom it formerly belonged, and the Germans. In 1848 the latter were defeated here by the Danes, then the place was retaken by the Prussians, and in 1860 was again in possession of Denmark. After a long siege it was captured by the Prussians in 1864.

Duprat, Antoine, French statesman, archbishop, and cardinal: b. Issoire 17 Jan. 1463; d. Rambouillet 8 July 1535. Under Louis XII. he was president of the parliament of Paris, and in 1515, on the accession of Francis I., became chancellor and prime minister. The chief event of his ministry was the conclusion of the concordat, against great clerical and academic opposition, by which the Church and nobility became subject to the Crown, and by which he nullified the desire of Pope Leo X. to abrogate the Pragmatic Sanction, which in 1438 limited the spiritual power of the Pope in France, and laid the foundation of the so-called Gallican Church. In this direction he was the precursor of Richelieu and Mazarin, in the work of consolidating the power of the state. For his services, he was appointed archbishop of Sens, and later was created a cardinal.

Dupray, Henri Louis, òn-rē loo-ē dū-prā, French painter: b. Sedan, France, 1841. He was the pupil at Paris of Pils and Cogniet, and early directed his attention to military subjects. His 'Bataille de Waterloo' (1870) is considered his most important work.

Dupré, Giovanni, jō-vān nē dū-prā', Italian sculptor: b. Siena, Italy, 1 March 1817; d. Florence 10 Jan. 1882. Among his works are: 'Abel'; 'Cain'; 'Sappho'; 'Giotto'; and 'Pieta'; the last representing the dead Christ, supported by his mother.

Dupré, Jules, zhül dū-prā, French landscape painter: b. Nantes 5 April 1812; d. L'Isle Adam 6 Oct. 1889. He began his career as a

painter of porcelain in his father's factory, but when 18 years old went to Paris where his talent soon became recognized. He sent his first picture to the Salon in 1831; was made a chevalier of the Legion of Honor in 1849, and officer in 1870. He received a second-class medal at the Exposition of 1867 and the same at the Exposition of 1883, and a medal of honor at the Exposition of 1889. His studio for some years was in the Forest of Fontainebleau, and later in L'Isle Adam. A number of his pictures are owned in the United States.

Dupuis, Charles François, shärl frän-swä dü-pwē, French scholar: b. Trie-le-Château, near Gisors, 16 Oct. 1742; d. Is-sur-Tille, France, 29 Sept. 1809. In his 24th year he was made professor of rhetoric at Lisieux. His 'Mémoire sur l'Origine des Constellations et sur l'Explication de la Fable par l'Astronomie' (1781) is erudite, but rather sophistical. Later works of his are: 'Origine de tous les Cultes, ou la Religion universelle' (1794); two works on the Pelasgi, which attracted great attention; treatises on the zodiac of Denderah, and on the Phoenix; 'Mémoire explicatif du Zodiaque chronologique et mythologique' (1806).

Dupuis, Nathan Fellowes, Canadian scientist: b. Portland, Ontario, 13 April 1836. He was graduated at Queen's University, Kingston, in 1866, and has been a professor there for 28 years, occupying the chair first of chemistry and natural science, then of mathematics, which he still fills. He is a Fellow of the Royal Society of Canada, and editor of the Canadian 'Educational Monthly.' His published works include 'Elements of Geometrical Optics' (1868); 'Geometry of the Point, Line and Circle in the Plane' (1889); 'Elements of Synthetic Solid Geometry' (1893).

Dupuy, dü-pwē', Eliza Ann, American novel writer: b. Petersburg, Va., about 1814; d. New Orleans January 1881. 'The Conspirators,' her first novel, has Aaron Burr as the principal character. Most of her stories, some 40 in number, were published in the New York 'Ledger.'

Dupuytren, Guillaume, gē-yōm dü-pwē-trän, BARON, French surgeon and anatomist: b. Pierre-Buffière, Haute-Vienne, 6 Oct. 1777; d. Paris 8 Feb. 1835. In 1801 he obtained the situation of overseer of anatomical labors at Paris; and became in 1815 first surgeon to the Hôtel Dieu. In 1823 he was appointed first physician to the king, Louis XVIII., and retained the same situation under Charles X. He possessed extraordinary acuteness in respect of diagnosis, united with remarkable skill and dexterity in the most dangerous operations, in performing which he had a firmness of nerve which was never shaken. He invented several surgical instruments and modes of operation, and also made some discoveries in pathological anatomy. Some of his pupils united in publishing his 'Oral Lectures on Clinical Surgery' (1830-34); and his 'Theory and Practice as to the Treatment of Wounds by Warlike Weapons,' was published in 1834.

Duquesne, dü-kän, Abraham, French admiral: b. Dieppe 1610; d. Paris 2 Feb. 1688. In his 17th year he was in the sea-fight off Rochelle, and distinguished himself during and after the year 1637 in the war against Spain. In 1647 he

commanded the expedition against Naples. Bordeaux, which had rebelled, he reduced, notwithstanding the assistance afforded it by Spain. In the Sicilian war he thrice defeated the combined fleets of Holland and Spain, under the renowned De Ruyter, who was mortally wounded in the last engagement. After he had reduced Algiers and Genoa to the necessity of supplicating the mercy of Louis XIV., the king conferred upon him the estate of Bouchet, and made it a marquisate, with the title of Duquesne. More than this he could not do, because Duquesne was a Protestant. He was, also, the only person exempted from the banishment of his sect, occasioned by the repeal of the Edict of Nantes.

Duquesne, dü-kän', Pa., borough, in Allegheny County; on the Monongahela River, and the Pennsylvania Railroad; about 10 miles from Pittsburgh. The industries, chiefly the manufacturing of steel, and iron products, are extensive. Pop. 9,300.

Duquesnoy, François, frän-swä dü-kä nwä, or "FRANÇOIS FLAMAND", Flemish sculptor: b. Brussels 1594; d. Leghorn, Italy, 12 July 1646. He was taught by his father and became celebrated at an early age. His best works are child figures. The Baldachino in the Vatican contains examples of his art.

Dura Mater, dü-ṛa mā'tēr, the outer envelope or covering of the brain. See BRAIN.

Duram, or Durão, José de Santa Rita, hō-sä' dā sän'tä ré'tä doo-rän', Brazilian poet: b. near Mariana, province of Minas Geraes, 1737; d. Lisbon, Portugal, 1783. He qualified himself for the service of the Church by his studies at Rio Janeiro and at Coimbra in Portugal, was graduated doctor of divinity at the university of the latter city, and joined the religious order of St. Augustine. In the course of his travels in Spain and Italy he became acquainted with Alfieri and other eminent men of letters, and subsequently during his residence at Coimbra composed a poem founded upon the story of the Galician adventurer, Diego Alvarez Correa, surnamed Caramuru, the legendary hero of Bahia. This poem was published at Lisbon in 1781, under the title of 'Caramuru, poema epico do descobrimento da Bahia,' and a French version appeared at Paris in 1829. On its first appearance the poem was not highly estimated, but since then has risen to the rank of a national epic in Brazil.

Duramen, dü-rä'mën (a Latin word for hardness), the heart-wood, or central wood in the trunk of exogenous trees as found in *dicotyledons* and *conifers*. (See CONIFERA.) It is hard and dense, and often dark-colored, with its tubes dry and thick. Thus in the ebony the duramen is black, and is the part used for furniture and fine cabinet-making. The alburnum (q.v.), or outer wood, is pale. In the beech the heart-wood is light brown; in the oak deep brown; in the Judas-tree yellow, and in guaiacum greenish. The relative proportion of duramen and alburnum differs in different trees. By ship-carpenters the duramen is known as the "spine."

Duran, doo-rän', Augustin, Spanish scholar: b. Madrid 14 Oct. 1789; d. there 1 Dec. 1862. He paid much attention to the study of foreign, especially to French literature, and edited a very important collection of Moorish, miscellaneous, and historical ballads, and ballads

DURAN — DURANDUS

of chivalry (1828-32), a new edition forming part of the extensive 'Biblioteca de autores Españoles' (Madrid 1849-51). He also wrote a history of the Spanish drama from its origin to the middle of the 18th century.

Duran, Carolus, kâ-rô-lüs' dü-rân (CHARLES AUGUSTE EMILE DURAND), French painter: b. Lille, 4 July 1837. He received his early art education at the municipal school in his native town, and in 1853 went to Paris and spent much time in copying again and again 'La Joconde,' at the Louvre. He gained the Wicar traveling scholarship, and went to Italy, and at Rome painted 'La Prière du Soir,' exhibited at the Salon in 1865. For 'L'Assassiné' (1866) he was awarded his first medal. This picture and a portrait of M. Ed. Reynart was purchased by the government for the museum at Lille. Duran resided for a year in Spain, and the influence of Velasquez is clearly seen in his 'St. Francis of Assisi,' exhibited at the Paris Salon in 1868. But his fame rests principally on his portraits, which are very numerous, and executed with a power and dash which are undeniable, whatever we may think of their refinement or grace. Among them may be mentioned Emile de Girardin, those of his daughters, the equestrian portrait of Mlle. Croizette, the well-known actress, and a portrait of Pasteur. He is a Chevalier of the Legion of Honor, and of the Order of Leopold. In 1898 he made a lecturing tour to the United States, this being his second visit. In the same year he was elected president of the National Society of Fine Arts.

Durance, dü-râns, a river in France, which rises in Mount Genève, on the west slope of the Cottian Alps; flows in a general direction south, and, after a course of 180 miles, empties into the Rhone, 4 miles below Avignon. The stream is so full of debris that it is not navigable. It often commits great ravages by inundation.

Durand, dü-rân, Alice Mary Céleste Fleury ("HENRY GRÉVILLE"), French novelist: b. Paris 12 Oct. 1842; d. there 26 May 1902. In early life she went to St. Petersburg with her father, Professor Fleury. She there married M. Durand, a French law professor, returning to France in 1872. She visited the United States in 1886 and several of her novels re-published in America, had a wide circulation here. Her published works, appearing under the pseudonym, "HENRY GRÉVILLE," include: 'A Travers Champs' (1812); 'Dosia' (1876); 'L'Expiation de Savelli' (1876); 'La Princesse Oghéroff' (1876); 'Les Koumiassine' (1877); 'Suzanne Normis' (1877); 'Sonia' (1877); 'La Maison Maurège' (1877); 'Les Epreuves de Raissa' (1877); 'L'Amie' (1878); 'Un violon russe' (1879); 'Lucie Rodéy' (1879); 'Le Moulin Frappier' (1880); 'La cité Ménard' (1880); 'Madame de Dreux' (1881); 'Rose Rozier' (1882); 'Manuel d'Instruction Civique et Morale des Jeunes Filles' (1882); 'Un Crime' (1884); 'Idylles' (1885); 'Cléopâtre' (1886); 'Frankley' (1880); 'L'avenir d'Aliné' (1889); 'Chant de Noces' (1889); 'Le Passe' (1890); 'Un Mystère' (1890); 'Aurette' (1891); 'Péril' (1891); 'L'Héritière' (1891); 'Un vieux menage' (1893); 'Fidelka' (1894); etc.

Durand, dü-rând', Asher Brown, American painter and engraver: b. South Orange, N. J., 21 Aug. 1796; d. there 17 Sept. 1886. For a long time his employment consisted in copying prints

from English books, and working on plates for bank-notes. His engraving of Trumbull's 'Declaration of Independence' brought him into general notice, and thenceforth for many years his graver was in constant demand for portraits of various dimensions, and figure pieces. He had always, however, entertained the idea of ultimately becoming a painter, and in 1835, having for the previous 10 years been a regular contributor of portraits, small figure pieces, or landscapes in oil, to the exhibitions of the National Academy of Design, finally abandoned engraving as a profession. He devoted himself thereafter mainly to landscape painting, in which department of art he became eminent. The Corcoran Art Gallery, at Washington, contains his 'Mountain Forest' (1869).

Durand, William Frederick, American engineer: b. Bethany, Conn., 5 March 1859. He was graduated at Annapolis, 1880; served in the United States Naval Engineer Corps (1880-7); was professor of mechanical engineering in the Michigan Agricultural and Mechanical College (1887-91), when he became associate professor of marine engineering at Cornell, and full professor in 1895. He has also been principal of the Graduate School of Marine Engineering and Naval Architecture since 1891. He has published 'Resistance and Propulsion of Ships' (1898); 'Practical Marine Engineering' (1902); and many special articles in engineering journals.

Durand, Wis., city, county-seat of Pepin County; on the Chippewa River, about 20 miles from its junction with the Mississippi, and on the Chicago, M. & St. P. R.R. It is the centre of an agricultural region, and its trade and industries are those that pertain to agriculture and stock-raising. Pop. (1900) 1,458.

Durando, doo-rân'dô, Giacomo, Italian general: b. Mondovi, Italy, 1807; d. Rome 26 Aug. 1894. He was minister of war at Turin 1854-5; became a senator in 1860; was minister of foreign affairs in the cabinet of Ratazzi 1862-3, and president of the senate 1884-7. He published in 1847 a brochure in favor of Italian unity under a constitutional government.

Durandus, dü-rân'dus, Guilielmus, French prelate and jurist: b. Puimisson, Languedoc 1237; d. Rome 1 Nov. 1296. He became professor of the canon law in the University of Modena, and there acquired so high a reputation for his learning that Pope Clement IV. made him auditor of the Sacred Palace, and took him as his secretary to the General Council of Lyons (1274). He continued to hold high office in the Curia under successive popes till 1277, when he was appointed lieutenant-governor, both in temporal and spiritual affairs, of the patrimony of St. Peter, under Nicholas III.; the following year he successfully asserted the sovereignty of the Pope over the provinces of Bologna and Romagna. These two provinces he then governed from 1283 to 1286, in the meantime carrying on a war against the people of Romagna, who were in revolt. He was appointed bishop of Meude in Languedoc in the latter year, and retired from the governorship. In 1295 he was again in public station, governor of Romagna, and the March of Ancona; but his strength was unequal to the task of resisting the attacks of the Ghibelline faction, and he resigned his office. His greatest work, 'Speculum Juris' (mirror of the law),

DURANGO—DURAZNO

called by himself ('Speculum Judiciale,' was for a long time a work of highest authority in the practice of both departments of the law; between the years 1474 and 1678 it had 38 editions. He wrote an informal history (commentarius) of the General Council of Lyons, the decrees of which were drawn up by him. Many other works he wrote, which have not been printed.

Durango, dü-răn'gō, Colo., town, county-seat of La Plata County; on the Las Animas River, the Denver & R. G., and the Rio Grande S. railroads; about 20 miles north of the boundary line between Colorado and New Mexico. The smelting and reduction works are the chief manufactories of the town. It has also flour-mills and foundries, and it is the trade centre for the agricultural, stock-raising, and mining products of the southwestern part of Colorado. Pop. 3,500.

Durango, doo-răn'gō, Mexico, a state bounded by Chihuahua on the north, Coahuila on the east and southeast, Zacatecas and Tepic on the south, and Sinaloa on the west. It is one of the largest and richest states in the republic. The Sierra Madre range (altitude 8,125 feet to 11,375 feet) traverses the western and southern portions. Less important ranges are the Copolquina, Topia, Cavelas, Amacuti, Tominil, Muinora, Guanacoi, and San Juan de Camarones; these, as well as the isolated peaks, Cerro del Mercado, Pánuco de Avino, etc., are ore-bearing. The Cerro del Fraile is an extinct volcano. Among the rivers, the Nazas, in the northern part of the state, with its affluents, the Santiago and San Juan; the Tunal, which rises west of the city of Durango, and its affluent, the Suchil; the Rio Chico, or Alaponeta, and the Aguanaval, may be mentioned. There are small lakes, mineral springs, etc. Gold, copper, and silver are the chief mineral products, and the best mining districts are in the partidos of San Dimas, Tamazula, Papasquiario, San Juan del Rio, Durango, and Nombredelos Dios. On 31 Dec. 1897 there were, according to Mexican official figures, 1,331 mining claims registered in Durango. The Cerro del Mercado, near Durango city, is said to contain an immense deposit of iron. Sulphur and rubies are also found. The climate varies with the altitude of the different localities, being cool or cold in the mountainous western regions, and temperate, or warm, in the valleys extending from the base of the mountains and in the Nazas basin. The pasture lands are extremely hot in summer and cold in winter. There is a moderate rainfall, and frosts occur frequently in the uplands. The best agricultural regions are in the partidos of Mapimi, Durango, San Juan del Rio, and Papasquiario; the agricultural products being corn, barley, wheat, cotton, tobacco, fruits, and sugarcane. The value of the barley produced in a year (Mexican official statistics for 1897) is \$19,310; cotton \$5,403,373; wheat \$602,320; sugarcane products \$11,908, etc. Stock-raising sections are the partidos of El Oro, Cuencamé, Durango, Mazas, Indé, and Papasquiario. Commercial centres are the partidos of Durango and Mapimi an active trade being maintained with the neighboring Mexican states, the United States, and Mexico city. Gold, silver, and iron ores, cereals, cotton, cotton and woolen goods, woods, fruits, live-stock, hides, etc., are exported. The principal imports are groceries, hardware, silk, cotton, linen goods, machinery, agricultural

implements, mining tools, arms and ammunition. The trade of the state has an estimated annual value of \$10,000,000. Manufactured products are: Leather, flour, ixtle carpets, rope, pottery, soap and candles, cotton goods, etc. The railroads are the Mexican International, and the Central. The cities of Durango and Villa Lerdo have street-car systems. There are 186 miles of telegraph, and 310 miles of telephone wires, and an efficient mail service. The state is divided into 13 partidos—Tamazula, pop. 24,305; Papasquiario, 32,410; Indé, 13,532; Mapimi, 42,548; chief town, Villa Lerdo, with steam flour-mills, a foundry, and other industrial establishments; Cuencamé, 22,940; San Juan de Guadalupe, 10,605; Nombredelos Dios, 23,090; Mezquitlan, 6,930; Durango, 60,427, chief town (also capital of the state) Durango (q.v.); San Dimas, 6,480; El Oro, 15,899; Nazas, 19,395; and San Juan del Rio, 25,573. Pop. of the state 295,105.

Durango Guadiana, or **Ciudad de Victoria**, Mexico, capital of the state of the same name, 569 miles from Mexico city. It has many fine buildings, notably the cathedral, government palace, city hall, the theatre, and the mint. There are cotton- and woolen-mills, foundries, flour- and sugar-mills, two banks, a street-car system, and a railroad to Ciudad Porfirio Diaz. Pop. 26,425.

Durant, Henry Fowle, American philanthropist: b. Hanover, N. H., 20 Feb. 1822; d. Wellesley, Mass., 3 Oct. 1881. He was graduated from Harvard in 1842 and became a lawyer, changing his name from Henry Welles Smith to H. T. Durant. He practised with great success at the bar, but on the death of his only son abandoned his profession and devoted his energies to philanthropy. He founded Wellesley College (q.v.), opened in 1875, and was successful as a lay preacher.

Durante, Francesco, frän-chës'ko doo-răn'të, Italian musician: b. Naples 15 March 1684; d. there 13 Aug. 1755. He is deemed one of the founders of the "Neapolitan school" of composition, and is especially celebrated as a teacher.

Duras, Claire Lechat de Kersaint, klär lê-shâ dê ker-sân dü-râ, DUCHESS OF, French novelist: b. Brest 1777; d. Paris 1828. She wrote 'Ourika' (1823), and 'Edward' (1825).

Durazno, doo-räs'nō, Uruguay, a department bounded on the north by Tacuarembó, southeast by Cerro Largo and Treinta y Tres, on the south by Florida and Flores, and on the west by Flores and Rio Negro. It is the most central of the departments, and in size the third. Area, 5,527 square miles. A range of hills divides it into two sections or basins, of which one extends northward to the Rio Negro, and the other southward to the Yi River, the department lying between these two rivers. Numerous streams, rising in the central chain of hills, flow toward the south or north; the entire surface is, therefore, well watered, and furnishes grazing for a large number of cattle, sheep, horses, and mules. Pop. about 25,000.

Durazno, Uruguay, capital of the department of Durazno. It is situated near the Yi River, and is one of the principal stations on the Central Uruguay Railroad. As an active centre for the trading of the neighborhood, it has substantial buildings, a church, hotels, and shops. Pop. 2,000.

DURAZZO — DÜRER

Durazzo, doo-rät'sō (ancient DYRRHACHIUM or EPIDAMNUS), Turkey, a seaport, in the province of Albania, on the Adriatic, 50 miles south by west of Scutari. It was originally founded by a colony of Greeks from Corcyra, and was long the most important maritime town of Illyria. A few columns and marbles are now almost the only remains of the ancient city; the modern town is a poor place of about 1,200 inhabitants.

Durban, dër'băn, Natal, town, the only seaport of Natal; situated on the northern shore of the land-locked inlet known as Port Natal. It is well laid out and solidly built, and has a number of fine buildings. There are railroad connections with the capital and other places. On the "Bluff" at the entrance to the port a battery of heavy guns has been placed. Durban was founded in 1834, and named after Sir Benjamin D'Urban, for some time governor of Cape Colony. Pop. 25,512.

Durbar, dër'bār (Hind. and Pers., *darbar*, door of admittance), in India, Afghanistan, and Persia a state audience at which important public hearings are given, decrees or decisions announced, distinguished foreign visitors received, and treaties, etc., made. These functions are often of great splendor and under British rule there have been several famous durbars in India. The first after the downfall of the Mogul empire and the Mutiny was held 1 Nov. 1858 at Allahabad. Lord Canning then announced the sovereignty of Queen Victoria, and offered amnesty to all but actual murderers of the English. Each viceroy since has held them to impress the Hindus. One of the most magnificent was held by Lord Lytton in 1877, when Queen Victoria took the title of empress of India. The then Prince of Wales had just been visiting India, and been received with enthusiastic demonstrations, and the viceroy summoned the feudatory rulers and their retinues to a great durbar at Delhi, where the proclamation of the new title was made, and festivities, including a grand ball, games, parades, fireworks, convocation of the Indian orders, etc., were held. Another of great splendor was given at the same city on 1 Jan. 1903, to proclaim the accession of Edward VII. The name "durbar" is used also for the audience chamber, as we speak of a church (building).

Durbin, dër'bîn, **John Price**, American Methodist clergyman and miscellaneous writer: b. Bourbon County, Ky., 1800; d. New York 17 Oct. 1876. He contributed extensively to current literature, and was the author of 'Observations in Europe, Principally in France and Great Britain' (1844); and 'Observations in Egypt, Palestine, Syria, and Asia Minor' (1845).

Düren (ancient MARCODURUM), Germany, town in Rhenish Prussia, on the Roer and the railroad from Aix-la-Chapelle to Cologne, 16 miles east by north of Aix-la-Chapelle. It is of Roman origin, and is mentioned under its ancient name by Tacitus. In 1543 it was destroyed by the Emperor Charles V., at the head of 50,000 men. Diets were held here by Charlemagne (775 and 779). The modern town has some handsome churches, a gymnasium, important manufactures of woollens, paper, leather, and hardware; several large distilleries, and an extensive trade. Pop. (1900) 27,171.

Dürer, Albrecht, äl'breht dü'rër, German painter: b. Nuremberg, Bavaria, 21 May 1471; d. there 1528. His father was a skilful goldsmith of Hungary, and himself instructed his son. Dürer's talent early developed itself, and although he had made great progress in his father's profession by the time he was 15, his inclination took a decided turn for painting. Michael Wohlgemuth, then the best painter in Nuremberg, became his instructor in 1486. Having finished his studies he entered upon his travels, returning home in 1494. Here he executed his masterpiece, a drawing of Orpheus. To please his father he married the daughter of Hans Frey, a celebrated mechanic; but this connection embittered his life, and perhaps brought him to an early grave. In 1505 he went to Venice to accomplish himself in his art. His abilities excited envy and admiration. He painted the 'Martyrdom of Bartholomew' for St. Mark's Church, which painting was purchased by the Emperor Rodolph, and removed to Prague. He also traveled to Bologna, to improve his knowledge of perspective. At his return, in 1507, begins the proper era of his greatness. His fame spread far and wide. Maximilian I. appointed him his court-painter, and Charles V. confirmed him in this office, bestowing upon him at the same time the painter's coat of arms, namely, three escutcheons argent in a deep azure field. Dürer was in favor with high and low. All the artists and learned men of his time honored and loved him, and his early death was greatly lamented. Profound application, great facility in the mechanical part of his art, and a remarkable talent of imitation, were the characteristics of Dürer, and enabled him to exert a great influence on the character of German art. He was the first in Germany who taught the rules of perspective, and of the proportions of the human body, according to mathematical principles. His treatise on proportions was occasioned, it is said, by his studies on the picture of 'Adam and Eve.' He not only made use of the burin, like his predecessors, but was also the inventor of etching, or, if not the inventor, the first who excelled in the art. He invented the method of printing wood-cuts with two colors. His great mathematical knowledge enabled him to form a regular system of rules for drawing and painting. He wrote the first book on fortification, in Germany, and showed how to cast the letters of the alphabet according to fixed proportions, by geometrical calculations. He was particularly eminent as a portrait painter. He had the power of catching the exact expression of the features, and of delineating all the passions. Among his best engravings in copper are his 'Fortune'; 'Melancholy'; 'Adam and Eve in Paradise'; 'St. Hubert'; 'St. Jerome'; and the 'Smaller Passion' (so-called) in 16 plates. Among his best wood-cuts are the 'Greater Passion' (so-called) in 13 plates; the 'Smaller Passion,' with the frontispiece, 37 pieces; the 'Revelation of St. John,' with the frontispiece, 15 plates; the 'Life of Mary,' two prints, with the frontispiece. Bartsch, however, has made it more than probable that Dürer himself did not engrave in wood. He only made the drawings on wooden tablets, which were then cut by form-cutters, of whom there were many skilful ones at that time. Dürer has also much merit as a writer. His writings, which were afterward translated into Latin, French,

etc., were published in a collected form at Arnheim (1603). See Scott, 'Albert Dürer, His Life and Works' (1869); Heaton, 'History of the Life of Albert Dürer' (1869); Thausing, 'Dürer, Geschichte seines Lebens und seiner Kunst'; Colvin, 'Albrecht Dürer, His Teachers, His Rivals, and His Scholars' (1877); Ephrussi, 'Albrecht Dürer et son dessein' (1882); Springer, 'Albrecht Dürer' (1892); Cust, 'Albrecht Dürer' (1897).

Duress, *dū'rēs* or *dū-rēs'* (Ital. *duressa*, Lat. *duritia*, deriv. of *durus*, hard), restraint of liberty, or restraint of the person or goods. (1) Of the person. This is exercised either by incarceration or by threats or menaces, *duress per minas*; in either case the overt act must consist in compelling a person to do some act, as to execute a deed or commit an offense; in such cases the act is invalid and excusable. In a broader sense, duress is charged by the law when a person in extreme poverty or distress is induced to seek alleviation by assuming an obligation. Yet the deed signed, or the contract made under duress is not void, though voidable at the will of the party compelled to execute or assume it. (2) Duress of goods refers to the case of one who is compelled to pay money for the release of goods unlawfully detained. Duress may be charged to the collector of a port who charges unauthorized duties.

Duret, Francisque, *frän-sësk dü-rä*, French sculptor: b. Paris 19 Oct. 1804; d. there 25 May 1865. He studied sculpture in Paris with intense ardor; in 1823 he won the Roman prize, and gained a gold medal in 1831 by his 'Mercury, Inventor of the Lyre,' which recalled somewhat the refined modernity of Canova. Indeed, Canova seems to have been rather the source of inspiration to him than the models of the antique. In 1833 he produced 'The Neapolitan Fisherman Dancing the Tarantula,' a work of life-like realism, of perfect elegance and the most refined modeling, which is his masterpiece, and stands in the Louvre. In the same gallery is his 'Improvisator Singing a Love-Song' (1836), a replica of which is in the city museum of Leipsic. For the museum at Versailles he executed statues of Molière, Dunois, and Richelieu; for the Madeleine figures of Christ and St. Gabriel. The gallery of seven chimneys in the Louvre is adorned by his 'Victory,' and for the foyer of the Théâtre Française he executed statues of 'Tragedy' and 'Comedy' and a figure of Rachel, the actress. In 1860 he completed the monumental fountain on the Place de St. Michel, in Paris. It is surmounted by a figure of 'St. Michael the Dragon-Slayer.' As professor in the École des Beaux Arts, his energies were concentrated on the task of teaching and he produced few original works; those which he has left are good examples of modern French sculpture with its ease, its demonstrative fluidity and dramatic point, which take the place of the serenity and severe but flawless grace of the Greek masters.

Durfee, dër'fē, Job, American jurist: b. Tiverton, R. I., 20 Sept. 1790; d. there 26 July 1847. He was graduated at Brown University in 1813; was elected to Congress in 1820, and became chief justice of Rhode Island in 1835. Among his various writings is 'What Cheer,' a poem on the adventures of Roger Williams.

Vol. 6—33

Durfee, Thomas, American jurist: b. Tiverton, R. I., 6 Feb. 1826; d. Providence, R. I., 6 June 1901. He was graduated at Brown University 1846; was admitted to the bar 1848; reporter of the Rhode Island supreme court 1849-53; presiding judge of the court of magistrates 1855-60; speaker of the Rhode Island house of representatives 1863-5; associate justice of the Rhode Island supreme court 1865-75; and chief justice 1875-91, when he retired. He was elected a trustee of Brown University 1875, and its chancellor 1879-88. He published: 'Reports of Cases in the Supreme Court of Rhode Island' (1851-3); 'Treatise on the Law of Highways' (1857), begun by J. K. Angell; 'The Village Picnic, and Other Poems' (1872); 'Gleanings from the Judicial History of Rhode Island' (1883); 'Some Thoughts on the Constitution of Rhode Island' (1884); and several orations on public occasions.

Durfee, William Franklin, American engineer: b. New Bedford, Mass., 15 Nov. 1833; d. Middletown, N. Y., 14 Nov. 1899. He studied at Lawrence Scientific School, Harvard, and turned his attention to steel manufacture, his establishment turning out in 1865 the ingots from which were made the first steel rails in the United States. After 1875 he practised as a consulting engineer and patent expert.

D'Urfey, dër'fi, Thomas, commonly known as "Tom D'URFEY," English dramatist and poet: b. Exeter, 1653; d. London 26 Feb. 1723. He was a good-natured, simple-hearted, thoroughly vulgar and unliterary writer. His dramas, comedies, operas, tragedies, and songs are exactly like what Sancho Panza would have written if he had taken to letters. Many, like 'The Siege of Memphis' (1676), an extravagant tragedy, and 'The Plotting Sisters' (1691), a comedy, are verbose; others, like the 'Songs Complete' (1699), are of virginal simplicity, but not of virginal modesty.

Durga, door'gä (Sanskrit, "The Inaccessible One"), a Hindu divinity, one of the names given to the consort of Siva. She is generally represented with 10 arms. In one hand she holds a spear, with which she is piercing Mahisha, the chief of the demons, the killing of whom was her most famous exploit; in another a sword; in a third the hair of the demon chief; and in others, the trident, discus, axe, club, and shield. A great festival in her honor, the *Durgapuja*, is celebrated annually in Bengal with wild orgies about the beginning of October, and lasts for about 10 days in all. See SIVA, DEVI.

Durgah, The, a famous tomb built for the Sheikh Selim-Chisti, at Futtehpore, near Agra, in Hindustan. It was erected at a cost of 37 lacs of rupees, or \$1,750,000. The tomb as well as a canopy, six feet high, which covers it, is made of mother-of-pearl. The floor is of jasper and the walls of white marble inlaid with cornelian. The screens of marble surrounding the building are the most beautiful in India. They are single, thin slabs about eight feet square and wrought into such intricate open patterns that they appear as having been woven in a loom.

Durham, dūr'am, John George Lambton, EARL OF, English statesman: b. London 12 April 1792; d. Cowes, Isle of Wight, 28 July 1840. He took an active part in furthering all projects of a reforming tendency, even bringing

forward in 1821 a scheme for parliamentary reform much more advanced than that of 1832. In 1828 he was raised to the peerage, with the title of Baron Durham. Under the administration of Lord Grey (1830) he held the office of Lord Privy Seal, and was one of the four persons who drew up the Reform Bill, and supported it in the House of Lords. For a time he was ambassador at St. Petersburg. In 1838 he was appointed governor-general of Canada, where owing to the revolt of the French in Lower Canada, the constitution had been suspended. Lord Durham's measures were statesmanlike, but dictatorial; and the House of Lords voted disapproval of some of his acts. Thereupon he took the extraordinary step of returning to England without either being recalled or obtaining the royal consent. Lord Durham's famous report on Canada anticipated many of the best features in the present Canadian constitution.

Durham, one of the three English counties called counties palatine (see COUNTY PALATINE). There is more coal mined in Durham than in any other county of England; and lead and iron mines are worked. Some of its manufactures are iron works, potteries, linen- and woolen-mills, glass and chemical works. Pop. (1901) 1,187,324.

Durham (ancient DUNHOLME), England, city and parliamentary borough, capital of the county of the same name, on the River Wear; 14 miles south of Newcastle. The principal public buildings are the ancient castle (now appropriated to the uses of the university), the cathedral, and other churches, the town hall, county prison, and the grammar school. The educational institutions comprise the university, the grammar school, training school for school-mistresses, and other schools. There are manufactures of carpeting and mustard. The cathedral is believed to have been founded by William de Carilepho, assisted by Malcolm, king of Scotland, in 1093. Pop. 14,935.

Durham, N. C., city in Durham County, on the Southern Air Line and the Southern railroads; 26 miles northwest of Raleigh. It is a tobacco and cotton-growing centre, and the seat of Trinity College (Methodist Episcopal South). The manufacture of a famous brand of smoking tobacco is the staple industry of the place. It was the scene of the treaty between Gens. Sherman and Johnston at the close of the Civil War. It has a national bank, newspapers, and good schools. Pop. 6,679.

Durham Book, The, or St. Cuthbert's Book, a manuscript of the Latin text of the gospels, with an interlinear gloss in Saxon. The book dates from the last of the 7th century, and is supposed by some to have been written by Eadfrith, of Lindisfarne. It is one of the most beautiful of the manuscripts made by the old monks, and is one of the most highly prized treasures of the British Museum.

Durham Cattle. See CATTLE.

Durham, University of, located at Durham and which was originated in 1831 under Bishop Van Mildert, by the appropriation of part of the property belonging to the cathedral chapter. In 1832 an act of Parliament was obtained sanctioning the erection of the proposed university; in 1833 the university was opened, and in 1837

it was incorporated by royal charter. In 1841 the office of warden was permanently annexed to the deanery of Durham, a canonry in the cathedral was annexed to each of the professors of divinity and Greek; a professor of mathematics and astronomy appointed, and 18 fellowships were founded, besides 6 which had previously been founded by the dean and chapter. As at Oxford and Cambridge, the students reside mostly within the university buildings, accommodation being provided for them in University College, and in Bishop Hatfield's Hall. The university awards the degrees of Bachelor and Master of Arts, Bachelor and Doctor of Literature, of Science, and of Divinity; the usual medical degrees, degrees in music, and the degree of Doctor of Civil Law. The academical year is divided into three terms—Michaelmas, Epiphany, and Easter. No religious test is required from any member of the university unless he is a student in the faculty of theology. Science was taught from the first, but not to a satisfactory extent till 1871, when the Durham College of Science was instituted in connection with the university at Newcastle-upon-Tyne. The medical department of the university is constituted by the Durham University College of Medicine, founded in 1851 at Newcastle, an institution which has greatly increased in efficiency in recent years by the establishment of additional chairs. Since 1895 all degrees except those in divinity may be granted to women.

Durian, dū'ri-ān, or **Durion** (*Durio zibethinus*), a fruit-tree of the natural order *Malvaceae*, generally diffused over the southeast of Asia, especially in the Malay peninsula and neighboring islands. It is esteemed for the flavor of its fruit which, however, is an acquired taste, the fruit having a strong, musk-like odor, and a somewhat terebinthine flavor. The tree, which on an average yields 200 fruits annually, is about the size and the form of a pear-tree, but with cherry-shaped leaves, except that they are entire and smooth at the edges. The flowers are large and of a yellowish-white. The fruit, of globular or oval form, from eight to ten inches long, large in some species as a man's head, is not unlike the bread-fruit externally. It has a hard, prickly rind, covered with warts and tubercles. When ripe it becomes of a brownish-yellow, and opens at the top; it must be eaten almost fresh from the tree, as it putrefies in less than 24 hours. The fruit contains five large longitudinal cells, each containing one to four seeds about the size of pigeon's eggs, embedded in a custard-like pulp, which is the delicious part of the fruit. The seeds are roasted and eaten like chestnuts, ground into flour, and also made into vegetable ivory. The pharmaceutical qualities of the fruit are aphrodisiacal.

Dürkheim, dürk'hīm, or **Dürkheim an der Hardt**, Bavaria, town in the Palatinate, 14 miles southwest of Mannheim. Its annual sausage market, founded in 1494, is attended by large numbers of people. Dürkheim has saline springs, in the water of which Bunsen and Kirchhoff, by spectrum analysis, first detected the metals rubidium and caesium in 1860. Dürkheim was walled and fortified, so was an object of keen contest during the Thirty Years' War. Pop. 6,055.

Durlach, door'lāh, Germany, town in the Grand Duchy of Baden, four miles southeast

of Carlsruhe, at the foot of the Turmberg. It is of Roman origin. It has manufactures of iron, machinery, organs, sewing-machines, gloves and beer, and is celebrated for its fruit. Pop. 11,425.

Durmast, dër'mast, a species of oak, *Quercus scssiliflora*, or according to some *Q. pubescens*, a variety of the common oak (*Q. robur*). Its wood is, however, darker, heavier, less easy to split, not so easy to break, yet the least difficult to bend. It is highly valued, therefore, by the builder and cabinet-maker.

Duroc, Michel Gérard Christophe, mē-shēl zhā-rār krēs-tōf dü-rōk, Duke of Friuli, French soldier: b. Pont-à-Mousson, 25 Oct. 1772; d. Bautzen 22 May 1813. He served as aide-de-camp to Napoleon in the Italian and Egyptian campaigns. In 1805 he was made grand marshal of the palace, and was frequently employed in diplomatic missions, though he still took his full share in the wars of France till the time of his death. He was a great favorite of Napoleon, and was killed by his side at the battle of Bautzen.

Durra, dūr-ā, a genus of grasses of great economical importance throughout Africa and Asia, especially in India, also called Indian millet, Guinea corn, or Sorgho grass. See SORGHUM.

Dürrenstein, dūr'rēn-stīn, Austria, village on the Danube; 41 miles northwest of Vienna. It is celebrated for its feudal castle, in which Richard Cœur-de-Lion was treacherously detained on his return from Palestine (1192) by Duke Leopold of Austria. It was destroyed by the Swedes in 1645. In November, 1805, the French here defeated the Austrians and Russians.

Durugmunan, doo-roog-moo'nān, a race possessing Mongolian characteristics and dwelling in the interior of the island of Mindoro.

Duruy, Georges, zhōrzh dü-rü-ē, French writer on history: b. Paris 1853. He became professor of French literature in the Polytechnic School in 1891. He wrote some novels that became popular favorites, as 'The Life-guard'; 'A Soul's Victory'; 'Dream-End.' His principal historical works are: 'History of Turenne'; 'Short Popular History of France.' His 'Cardinal Carlo Carafa: a Study on the Pontificate of Paul IV.' (1883) was crowned by the Academy.

Duruy, Victor, vĕk-tōr, French historian and statesman: b. Paris 11 Sept. 1811; d. there 25 Nov. 1894. He was professor of history in the Collège (afterward Lycée) Henry IV. prior to 1861. In 1862 he was appointed inspector-general of public instruction and professor at the École Polytechnique, and in the following year Napoleon III. made him minister of public instruction. During his six years' tenure of this office he carried out many important reforms in spite of the determined opposition of the clerical party, and on resigning his office in 1869 he was nominated a member of the senate. He was elected a member of the Academy of Inscriptions in 1873, and in 1884 a member of the French Academy. Besides many excellent school manuals, he wrote: 'Histoire des Romains depuis les Temps les plus Reculés jusqu'à L'Invasion des Barbares' (1870-9), his most important work; 'Histoire des Grecs depuis les

Temps les plus Reculés jusqu'à la Réduction de la Grèce en Province Romaine' (1862), crowned by the Academy; 'Histoire de France' (1852); 'Introduction Générale à l'Histoire de France' (1865); and other works. He was general editor of Hachette's great 'Histoire Universelle.'

Durward, Quentin. See QUENTIN DURWARD.

Duryée, dūr-yā, Abram, American soldier: b. New York 1815; d. there 1890. He was educated in the common schools, and going into business made his fortune in mahogany furniture. He entered the State militia in 1833, was made colonel of the 27th Regiment in 1849 and was conspicuous as a maintainer of order during the riots that prevailed up to 1861. During the Civil War he raised the regiment known as 'Duryée's Zouaves,' and was promoted to be brigadier-general of volunteers in August 1861, but resigned in January 1863 owing to a disagreement over a question of rank. His gallant services at the battles of Cedar Mountain, Rappahannock Station, Thoroughfare Gap, Groveton, Chantilly, South Mountain, and Antietam gained for him the brevet rank of major-general in 1865. In 1874, as police commissioner of New York, he attacked and dispersed a body of communists seditiously gathered together in Tompkins Square.

Duse, doo'sā, Eleanora, Italian actress: b. Vigevano, Italy, 3 Oct. 1859. Her childhood and early youth were filled with sorrow, arising from poverty, hardships, the loss of friends and an unworthily bestowed affection. Hers was a lineage of actors, and her early environment destined her for the stage. Her grandfather founded the Garibaldi Theatre in Padua. She was dragged about the minor theatres of Italy in her father's companies, playing Cosette in 'Les Misérables' at 7, and star of the little troop at 13 in 'Francesca da Rimini.' When she was 14 she played Juliet at Verona, in an open-air theatre, her performance compelling recognition as most extraordinarily brilliant. Still she had to wait for general recognition until 1879, when she played Zola's 'Thérèse Raquin' in Naples in 1887. She appeared in Venice in 1892, and later in all the chief European cities, making her debut at the Fifth Avenue Theatre in New York as Camille in Dumas' play of that name, January 1893. Among the roles which she has triumphantly essayed are Marguerite, Magda, Paula, La Femme de Claude, La Locandiera. She was married to an Italian actor-journalist, Signor Checchi, before she was 20, but they soon separated. Duse has remarkable emotional power and the ability to represent suffering and to make the most of tragic situations, at the same time possessing such versatility that she can play parts of opposite character the same evening. She pays little attention to the meretricious accessories of the stage makeup. Great simplicity and naturalness, coupled with striking intensity, characterize her acting. She has great excellence in diction and in facial expression, the latter being continuous and minute. Her repertory is enormous, her art including the plays of Dumas, Scribe, Verga, Prega, Ibsen, Sudermann, d'Annunzio, and Shakespeare. Her tours in the United States, 1893, 1896, 1902-3, were very successful from the artistic and managerial point of view.

DUSKY DUCK — DUST

Dusky Duck, or Black Duck, a north American duck (*Anas obscura*), closely related to the mallard, but of a prevailing sooty hue in its plumage. It is peculiar in being confined to the eastern half of North America, breeding abundantly in Labrador, and appearing in the United States in winter, when it becomes one of the principal market ducks. Its nest, eggs, and general habits are like those of the mallard.

Dussaud, dūs-sō, Frantz, Swiss physicist and inventor: b. Geneva, Switzerland, 1870. He was appointed professor of physics in the university of his native town in 1892 and superintendent of public instruction in 1895, in which year he was elected deputy to the assembly. Besides his services as a scientific writer, he has invented many ingenious and useful appliances such as the phonograph for the deaf, the cinematograph for the blind, the loud-speaking telephone, the registering telephone, etc.

Dussek, Jan Ladislav, yān lād'is-lā doo'-shék, Bohemian composer and pianist: b. Czeslau 9 Feb. 1761; d. St. Germain-en-Laye 20 March 1812. He was trained at Iglau, Kuttenberg, and Prague, and afterward was organist at Mechlín and Bergenop-Zoom. At Amsterdam he met with much success, both as a teacher and performer, and here he produced his earliest works for the pianoforte; he afterward resided at The Hague, and in Hamburg, Lithuania, Paris, Milan, and London (1788-1800), where he was very popular. In 1803-6 he lived as instructor and boon companion with Prince Louis Ferdinand of Prussia, whose death called forth the beautiful and pathetic 'Elégie Harmonique' (op. 61); in 1807 he entered the service of Prince Talleyrand, and thenceforward devoted most of his time to composition.

Düsseldorf, dūs'sél-dōrf, Germany, city, the capital of the government of the same name, in the Rhenish province; on the Rhine, here crossed by a bridge of boats, and on the railroad from Elberfeld, 22 miles northwest of Cologne. It consists of the old town in the north, Karlstadt, the new town, and Friedrichstadt in the south, with the suburbs of Derendorf, Flingern, Oberbilk, Unterbilk, and other small places. The chief public squares are the Corneliusplatz, with a fountain and a statue of Cornelius; Schadowplatz, with a monument of Schadow; the market-place with an equestrian statue of the Elector Johann Wilhelm; and the Burgplatz, with the tower of the castle which was founded in 1710 and burned down in 1872. In 1896 a bronze equestrian statue of the Emperor William I. was unveiled. The principal churches, of which there are 12 Roman Catholic and 3 Protestant, are St. Lambert's, a 14th century building, near the Rhine, adorned with marble monuments of Wilhelm IV. and Johann Wilhelm, the last two Dukes of Cleves and Berg; and St. Andrew's, completed 1629. Other buildings are the Academy, a modern building in the Renaissance style; the court-house, with Schadow's last oil-paintings; and a building of the 16th century, with fine paintings. The Academy of Art was founded 1767, by the Elector Theodore, remodelled in 1821, and afterwards directed by Cornelius and Schadow. This city has the honor of having founded a school of painting, which takes the name of Düsseldorf. In the Art Hall, opened in 1881, are several modern pictures; and there are some paintings by the

old masters, besides drawings, engravings, and water-colors, in the old palace. The Hofgarten is a magnificent public garden extending eastward from the Rhine; and there are also a zoological garden and a Floragarten. Düsseldorf carries on considerable manufacturing, and its trade as a port and railroad centre is large and increasing. After being the capital of the duchy of Juliers and Berg, Düsseldorf passed under the rules of the counts palatine of Neuberg, and then became the residence of the Elector-palatine John William, under whom it enjoyed great prosperity and became a centre of artistic work. It was taken by the French in 1795, restored to Bavaria by the Treaty of Luneville in 1801; in 1806 became the capital of the grand-duchy of Berg, with which it passed to Prussia in 1814. Pop. (1900) 213,767.

Dust, the fine particles of matter which float on currents of air, or settle on surrounding objects. Country air may contain only 200 particles of dust per cubic centimetre, while that of large cities may run up to 150,000, and in tenement houses as high as 1,000,000. These particles consist of sand, soot, cotton fibre, pollen, fine hair, pulverized excreta of animals, parts of seeds, bacteria, molds, etc. This is the ordinary condition of things. Frequently, as was the case after the Krakatoa eruption in 1883, the atmosphere becomes widely and densely charged with volcanic particles of varied minuteness, the smallest and lightest of which must take months, even years in settling. Remarkable color effects were produced in the heavens by the refraction of the sun's rays through these dust clouds. Aitken, a Scotch savant, has shown that no condensation of moisture (as in rain, mist, fog; see Fog) could occur without nuclei such as dust particles. He has also devised an apparatus for counting the number of dust particles in a given sample of air or gas. But one of the most important and serious questions concerning dust-laden air is the danger it brings to human life, as disseminating the bacteria of disease. Nearly one fourth of all deaths are due to consumption. Now the expectoration of a consumptive may contain millions of germs. Falling on the sidewalk or carriage-way of a city, it is soon tracked over a large area and gradually mixed with the dust; especially on asphalt pavements, where each wheel acts as a millstone, grinding everything into the finest powder, to be raised by passing vehicles into the air and sent into thousands of healthy lungs. The number of disease bacteria in the air has been calculated by many analyses. Taking 10 liters of air for a basis: in the Boston City Hospital the number of living bacteria was found to be nearly 450, and of molds 225. In a model New York hospital, where everything is supposed to be clean, 12 living germs settled on the disk, and, after sweeping, 226. In a New York tenement house carpeted living room, 75 living bacteria settled on the disk in an exposure of five minutes; after sweeping, 2,700, and mold settled on a plate or disk three and three quarters inches in diameter. Precautions have recently been taken against the peril of dust-spreading disease by constantly flushing the streets, and sweeping away all superficial dust into the sewers. The dust of such meteorites as undergo complete combustion on contact with atmospheric air, has been traced on the earth's surface; for example, on

DUST-BRAND — DUTCH EAST INDIES

the inland ice of Greenland in the shape of particles of magnetic iron with cobalt. Dust of the same sort has been found on the snow of various northern regions, and scientific men have given it the name of cosmic dust.

Dust-brand, or Smut, a disease of certain plants, as oats, barley, corn, and other cereals. It is caused by a parasite fungi called *Ustilago*, which causes a swelling that at length becomes a powdery sooty mass. The common forms are *Ustilago segetum* and *U. carbo*; that which attacks Indian corn is *Ustilago maydis*.

Dustin, Hannah, American heroine; she was the wife of Thomas Dustin and was captured by the Indians during their attack on Haverhill 16 March 1697. Her youngest child, an infant one week old, was killed, but her husband, with their other seven children was successful in escaping. The mother, with her nurse, Mary Neff, was carried off and put in charge of an Indian family consisting of two men, three women and seven children. The captives on their way to a large Indian village halted at an island six miles above the present Concord, N. H. Here Mrs. Dustin and her nurse, assisted by an English youth, Samuel Leonardson, killed and scalped all the Indians in their sleep, excepting one squaw, and a small boy, and after a difficult journey in which they endured many hardships, reached home in safety.

Dusty-foot. See **PIEPOWDER COURT**.

Dusty-miller, a common name of some of the plants of the genus *Primula* of the primrose family, from the white flour-like appearance of the leaves. The name is also applied to *Cineraria maritima*, a native of the Mediterranean shore, and much grown in greenhouses.

Dutch is the anglicized form of the word *Dietsch*, *Deutsch*, or *Deutsch*, which in the Middle Ages was applied to the Teutonic people who spoke a language other than the Latin or the Romance languages. *Dietsch* means, "belonging to the common people; vernacular." While the term Dutch was once applied by English speaking peoples to Germany and things German it has long been restricted to the language and people of the Netherlands. The people of Holland call themselves *Nederlandsch* and use their forms *Deutsch*, *Nederdeutsch*, as the Germans do *Deutsch*, *Niederdeutsch*. For Dutch Language and Literature, see **NETHERLANDS**.

Dutch Church, the church to which the majority of the people of Holland adhere. In the 16th century the Dutch wavered for a time between the Lutheran Church, whose leader was the great reformer, and the Reformed Church, whose leaders were Calvin and Zwingli. In 1571 they publicly professed their allegiance to the latter by embodying its doctrines in the Belgic Confession of Faith, published in that year. As long as they were under the sway of the Spaniards they, however, abstained from the use of the word Reformed, which had been introduced by the French, and styled themselves "Associates of the Augsburg Confession," the Spaniards considering Lutherans more easy to govern than Calvinists. One of the most notable events in the history of the Dutch Church, after the yoke of Spain was broken, was the Synod of Dort, in 1618. James Arminius, professor of theology at Leyden, having rejected the Calvinistic tenets and adopted those which

were destined to be called after himself, Arminian, a synod was convened at Dort to examine and, if need be, condemn his views. This was done, but with little effect, the views of Arminius prevailing to a greater extent after than they had done before their condemnation. The government of the present Dutch Church is Presbyterian. See **LUTHER**; **NETHERLANDS**; **REFORMATION**; **ZWINGLI**.

Dutch Clover, a common name for the white clover (*Trifolium repens*), a valuable pasture plant, very common throughout the United States, probably naturalized from Europe. It is also a native of Siberia, and is found in all temperate regions. It has a creeping stem, the leaflets are broad, with a horse-shoe mark in the centre, and the white or pinkish-white flowers form a roundish head. The plant is so well known that it has a variety of familiar names, the best known English names being sheep's-gowan, honey-stalks, lamb-sucklings, and occasionally shamrock. In America it is called honeysuckle clover. See **CLOVER**.

Dutch Concert, a so-called concert in which every man sings his own song at the same time that his neighbor is also singing his. There is another form of Dutch concert, in which each person present sings in turn one verse of any song he pleases, some well-known chorus being used as a burden after each verse.

Dutch Courage, false or fictitious courage, usually applied to the bravado inspired by partial intoxication. The phrase probably originated in the 17th century, when England's wars with the Dutch, and especially the naval reverses England suffered at their hands in the reign of Charles II., rendered in England the very name "Dutch" a synonym for all that was bad.

Dutch East India Company. See **EAST INDIA COMPANIES**.

Dutch East Indies, the islands in the Malay Archipelago owned by the Dutch; situated between 6° N. and 11° S. latitude, and between 95° and 141° E. longitude. The names, area, and population of the divisions are as follows:

DIVISIONS	Area: English sq. m.	Population in 1900
Java and Madura.....	50,554	28,745,698
Sumatra, West Coast.....	31,649	1,527,297
Sumatra, East Coast.....	35,312	421,088
Island of Benkulen.....	9,399	158,767
Sumatra Lampongs.....	11,284	142,246
Palembang.....	53,497	692,317
Atjeh.....	20,471	110,804
Riau-Lingga Archipelago.....	16,301	74,483
Banca.....	4,446	106,305
Billiton.....	1,863	43,386
Borneo, West Coast.....	55,825	370,775
Borneo, South and East Dis- tricts.....	156,912	716,822
Island of Celebes.....	49,390	1,448,700
Celebes Menado.....	22,080	293,947
Molucca Islands.....	43,864	430,855
Timor Archipelago.....	17,698	119,239
Bali and Lombok.....	4,065	431,696
New Guinea to 141° E. lon..	151,789	200,000
Total.....	736,400	36,000,000

The areas given are accurate; but, except for Java and Madura, the population is estimated. The figures, however, are approximately correct, as the official records give the census every

DUTCH GOLD—DUTCH REFORMED CHURCH IN AMERICA

five years. The population of some unexplored sections is not included. The last official returns give the total population, approximately 36,000,000, or about seven times as large as that of Netherlands. The number of Europeans in Dutch East Indies, in 1900, was 75,927; of Chinese, 460,000; of Arabs, 24,000; of people from parts of Asia other than China and Arabia, 27,000; and about all the remainder were natives. The chief occupation of the people is agriculture. The greater part of the land of the island of Java is government property, but in the western part there are a number of private estates. The government or the private owners of estates are entitled by law to one day's gratuitous work each week from each laborer on the estate, or, instead, to the payment of one guilder per head annually. Since the passage of the "agrarian" law in 1870 which granted waste lands on hereditary leases for 75 years, agriculture has increased in Java and the other islands. At first the government raised all the most productive articles as sugar, coffee, rice, etc.; but since 1891 the government has ceased to cultivate sugar, and it is now grown on the lands hired by the natives, or on lands held on emphyteutic tenure from the government. All the usual products are cultivated on private estates. The annual production of sugar has greatly increased from 1896 to 1901; the amount of coffee produced in the same time has decreased; cinchona has increased rapidly; tea, tobacco, and indigo have increased steadily. The yield of the tin mines of Bilton and Riouw, and of the coal mines of Java, Sumatra, and Borneo have increased each year. Buffaloes, oxen, cows, and horses are raised extensively. In India horses are not used for agricultural purposes.

Manufactories are increasing slowly; rice-mills, saw-mills, soap factories, ice and soda water manufactories are in some of the towns. In 1900 there were 3 government and 55 private printing presses. The principal articles of export are sugar, coffee, tea, rice, indigo, cinchona, tobacco, and tin. Nearly all of the exports, except rice, go to the Netherlands. The railroad and the mail and telegraph service is fair and is becoming better each year. The local revenue derived from land, taxes on houses and estates, from licenses, custom duties, personal imposts, some indirect taxes, and from the government monopolies of salt, opium, and railroads, and the sale of government products. About one-third of the annual expenditure is for the army and navy, another third for the general administration, and the balance for the local government administration. The "Java Bank" is controlled by the government. There are two other Dutch banks, several branches of banks in Great Britain, and a number of savings banks. The legal coins and the weights and measures are the same as for Netherlands. The local weights and measures are as follows:

The Amsterdamsch Pound	= 1.09 lb. avoirdupois.
" Pikol	= 133 $\frac{3}{4}$ lbs. "
" Catty	= 1 $\frac{1}{2}$ lb. "
" Tjengkal	= 4 yards.

In the administration of justice the principle observed is that Europeans and those assimilated with them, are subject to laws nearly similar to those in vogue in the Netherlands; and the natives are subject to their own

customs and institutions. The administration of justice for Europeans is in charge of European judges, while that for the natives is almost wholly in charge of native chiefs.

Schools are provided for all Europeans and natives. In 1900, there were five normal schools, four schools for sons of native chiefs, and the government and private elementary schools in Java and Madura numbered about 600, and for the outposts for the same year, 900.

Entire liberty of worship is granted to the members of all religious denominations. Christianity is increasing among the natives. In Java and the outposts, in 1873, there were 154,345 Christians, and in 1896, there were 309,258 Christians.

Dutch Gold. See DUTCH METAL.

Dutch Guiana. See GUIANA.

Dutch Harbor, Alaska, a port in the northeastern part of the island of Unalaska, situated on Bering Sea. It is a port of call for steamers passing through the Unimak Pass. See ALASKA.

Dutch Language and Literature. See NETHERLANDS.

Dutch Liquid, an oily liquid, known to the chemist as ethylene dichlorid ($C_2H_4Cl_2$), which is obtained by the action of chlorine gas upon ethylene, and also as a by-product in the manufacture of chloral. It has anæsthetic properties, and is reputed to be quite safe; but it is irritating to the throat, and is therefore not used. The name relates to its early preparation by the Dutch chemists.

Dutch Metal. See COPPER.

Dutch Oven, a spider, skillet, or camp-oven used by those who cook by hot coals on the hearth, a mode yet common in the western States of the Union, and unsurpassed in its results with skillful housewives. The pot stands in hot embers, and more of the same are piled on the dish-shaped lid. The phrase is also applied to a cooking-chamber suspended in front of a fire so as to cook by radiation.

Dutch Pink, a yellow lake, prepared from bark of the quercitron (the dyer's oak), used in distemper, for staining paper-hangings, and for other ordinary purposes.

Dutch Reformed Church in America. The history of the Dutch Reformed, or Reformed Dutch Church, had its beginning in Switzerland in 1516 under the leadership of the heroic and devout Zwingli. Holland early felt the impulse of the Reformed faith as it came to her by way of the Palatinate, and through Swiss and French influences received it modified as to doctrine and polity. That Calvin had much to do in giving shape to the government of the Church in its Swiss home may account for that robustness of character by which in the early days the Reformed faith had so wide and powerful an influence and that heroic endurance to withstand the persecutions which befell it. These persecutions under the direction of Charles V. of Spain (1519-55) and his son Philip (1555-81) while disturbing in a greater or less degree the peace of those countries holding the Reformed faith, it was sturdy little Holland which received the full fury of the sword and under the leadership of William of Orange achieved those victories that gave her civil and religious liberty. In six years

DUTCH REFORMED CHURCH IN AMERICA

from 1567-73, over 100,000 men gave up their lives to purchase such liberty. Great enthusiasm was aroused by holy and learned men, who while preaching the Gospel in the open fields, also urged resistance to every power opposed to the progress of the Reformed faith. Added to this, the devotion of the people was expressed in song. The hymns of Beza and Marot became an inspiration. Men everywhere sang them as they stood in the thickest of that fight whose outcome they determined should be religious liberty for themselves and their children. But while the Prince of Orange was able in time (1576) to carry his negotiations so far as to bring about "the Pacification of Ghent," it was not uninterrupted peace. Out of those troublous times, in 1579, came the "Union of Utrecht." Seven northern provinces of Holland bound together by a common faith making this the motto of their covenant, *Eendracht maakt macht* ("Union makes strength")—a sentiment used to-day by the American Reformed Church on its seal. The independence of the northern provinces, however, was yet to give place to something broader and grander. It was the founding of the Dutch republic with a history too resplendent to be given in detail, excepting to say that her career in everything that ennobles a people—her universities, her diplomacy, her constitution, her arts, sciences, and her maritime and commercial power became, and are yet, the admiration of the world.

It was, however, in the darkest days of her history that Holland was busy in formulating the doctrinal standards of the Reformed Church, its liturgy and polity. It was in 1566 that some Walloon and Dutch pastors met at Antwerp, and, joined by a few nobles, proceeded to form the first regular Church organization. The Belgic Confession, written by De Beers, with some slight alterations, was put among its doctrinal standards. The Heidelberg Catechism, written by Ursinus and Olivianus of the Palatinate, was also accepted, but not fully endorsed until a later period. This Antwerp organization might properly be called the first synod of the Church of Holland. Doctrinal standards were endorsed and adopted, although declaring at the time that the Word of God was their only rule of faith, and much of this work was afterward confirmed by the greater synods that followed.

The Synod of Wesel was held in 1568. This synod did more toward shaping the policy of the Church. Calvin's Presbyterian polity was modified as suited their circumstances and adopted. A learned and godly ministry loyally endorsing their faith was made a necessity and the duties of church officers were carefully defined. Three years having passed with their land yet under the ominous cloud of Charles V., the Synod of Emden was called in 1571. The acts and proceedings of the Synod of Wesel were re-endorsed, with new features of church government formulated and arranged. The first Synod of Dort—the first of the national synods—was called in 1576 at Dortrecht, Holland. The government of the Church was farther perfected in defining the four grades of ecclesiastical bodies, namely: The general synod—the highest council, synod classes and consistories. It also declared what thereafter should be the conditions of church membership. Following this was the important Synod of Middleburg,

held in 1581. Its chief work was to complete the organization of the Church, arranging all matters relating to schoolmasters, professors of theology, liturgy, and creed, with which in the deposition of Philip II., a month later, the Reformed Church became the established Church of the Netherlands. The great Arminian controversy that was agitating the young Church in the early part of the 17th century was the immediate cause of the calling of the second Synod of Dort in 1618. All of the Reformed churches of Europe were invited to send delegates and most of them responded. James I. of England sent the Bishop of Llandoff, Samuel Ward, professor at Cambridge, and Joseph Hall, who afterward became Bishop of Salisbury. The doctrines of grace respecting fore-ordination, the perseverance of the saints, sin, and the conversion of man, the atonement, upon which Arminius was believed to hold unsound views, became subjects of earnest discussion. The Remonstrants who, headed by Episcopius, supported Arminius, were excluded from office in the Reformed Church and in a learned formula called the 'Canons of the Synod of Dort,' the synod's views upon these great doctrines were accurately defined. When the foreign delegates had withdrawn from the synod at the close of the 144th session, the Dutch delegates remained and acted as a third National Synod. These proceedings were called "post-acta," and much was done to develop much farther the working power of the young Church. The call to the ministerial office, festival days, hymns to be used in worship, baptism of adults and the sick, professors of theology and their relation to the Church, a new translation of the Bible into Dutch, foreign missions, profanity, the liturgy, and also ministers' salaries, were matters provided for. Yet again the Heidelberg Catechism came up for discussion and was re-adopted with enthusiasm, ordered to be taught in the schools, in the home, and explained in the churches every Sabbath. A 'Compendium' of its teachings was prepared and put among its standards of doctrine.

It was about this time that Holland immigration to America began. For 20 years before the Dutch East India Company had been pushing its commercial enterprises in the Indian Ocean. To find a shorter route to India it sent Hendrik Hudson on his voyage of discovery. The result was he explored in 1609 the river which bears his name. Five years later the country between Virginia and New France, or, measured on the coast line, from the 40th to the 45th parallel of latitude was taken possession of, made a province of in 1623 and was called the New Netherlands. In 1621 a West India Company, an armed corporation, with unlimited powers of colonization, and with great power on the sea was formed and with it Dutch immigration was more widely extended. Settlements began to form about New York Bay and in the vicinity, while Manhattan Island was at once occupied and held by the West India Company. In 1626 Peter Minuet, born of Huguenot parentage, an elder in the French Reformed Church at Wesel, came to America commissioned as director of the now powerful West India Company. To strengthen the company's hold upon Manhattan Island he bought it of the Indians for the sum of \$24. With the coming of Minuet began the first religious services in the

DUTCH REFORMED CHURCH IN AMERICA

New Netherlands. He brought over with him two *Krankenbesocckers* or comforters of the sick—devout men who in a commodious room over a horse-mill held religious services. These were held until the arrival of the first minister, Rev. Jonas Michaelius, early in 1628, when the first Church of the Reformed faith was organized in 1628. Fifty communicants were present at the first Lord's Supper, among them some Walloons. The Walloons were of the Reformed Church in Belgium, bordering on Holland, and who spoke the old French language, hence called by the Dutch *Waalche*, corrupted to Walloon. Many of them settled on Long Island in the vicinity of Wallabout, or Walloons bay or cove. The ecclesiastical connection of the new Church was with the Classis of Amsterdam in Holland. The Rev. Everardus Bogardus took the place of Michaelius in 1633. With him also came the first schoolmaster of the colony. The loft over the horse-mill was now replaced by a plain wooden church at what is now 100 Broad Street, between Pearl and Bridge streets, New York. The "dominie," as the minister was called, had a house and stable near. The Church now began to grow slowly, and accessions were made from other countries. Up to the time of the English conquest in 1664, and after various vicissitudes, there were 13 organized churches doing their work on American soil. Dutch immigration continued, and settlements were made in New Jersey, along the Hudson River as far as Fort Orange (Albany) and on Long Island, with good work done in adjacent settlements.

In the early part of the 18th century, the young Church began to feel the necessity of new pastors for their many vacant churches. It was getting to be inconvenient to look to Holland for men ordained by the Classis of Amsterdam. The necessity of managing their own Church affairs themselves, and of educating and ordaining their own ministry was now becoming imperative. How this could be done at first was not clear either to the Church in Holland or America. A Coetus, or an association, was finally proposed that might be given authority as a high judicatory in the New Netherlands and have the power of ordination. After much opposition both in Holland and in the colony permission was granted which existed for six years until 1754. In that year began the great disruption, when the young Church became divided into the Coetus and the anti-Coetus parties, but they came together again upon a basis of union of 1772. The Colonial Period, 1771-92, was now passing away and it was also a period of transition to the Church. Changed conditions made it necessary to broaden the 84 articles of the Synod of Dort by adding 73 explanatory articles adapting the whole ecclesiastical machinery to the entire freedom the Church was now enjoying. Minor changes were afterward made in the constitution of the Church at two different times and in 1867 the Dutch Reformed Church after a warm discussion became the Reformed Church in America.

The Church never had a widely scattered constituency—its growth has uniformly followed the lines of Dutch immigration—it is chiefly found to-day doing its quiet work throughout the States of New Jersey, Pennsylvania, New York, and in many of the Western States. The constitution of the Church consists of its

standards of doctrine, its liturgy, and its rules of government. Its liturgy has come down from the Church of Holland, but its use is optional, excepting the forms for the Lord's Supper, baptismal forms, and forms for ordination. In doctrine the Church is moderately Calvinistic. The fundamental thought is Divine Sovereignty, and in all its standards, what are called the doctrines of grace are given emphasis. Its standards of doctrine are the Belgic Confession, the Heidelberg Catechism, and the Canons of the Synod of Dort, together with a 'Compendium' explanatory of the Catechism. All ministers and teachers of theology are obliged to subscribe to these standards. The form of government is Presbyterian, having four church courts, the consistory consisting of the pastor and the elders and deacons, which are chosen from the congregation every two years, the Classis, a semi-annual convention of adjacent churches represented by pastors and elders, the Particular Synod, meeting annually, composed of ministers and elders delegated by each Classis, the General Synod, delegates appointed by each Classis, and elected by the Particular Synod. There is 1 General Synod, 5 Particular Synods, and 35 Classes representing 652 churches, and 700 ministers.

The Dutch Reformed Church has always insisted upon an educated ministry. Next to being the oldest body of Presbyterians in America, it may also claim to have established the first School of Theology (1784). Before that the ministers of the Church came from Holland, while a few went there for their education. The Theological Seminary at New Brunswick, N. J., with its six professors, is the result of the modest beginning. A second Theological Seminary is at Holland, Mich., and a third is connected with the Church's missionary work in India. This Church is also believed to have antedated any other body in founding the first college. A charter for a college was granted by Gov. Franklin of New Jersey in 1766, but a second and amended charter under which it organized was granted 20 March 1770, called Queens College, afterward changed to Rutgers College, and permanently located at New Brunswick, N. J. The New Jersey State Scientific School is also a part of the institution. The great immigration from Holland to Michigan and the neighboring States in 1847 and their prosperity made it soon appear that their high school which had passed under the control of the General Synod as Holland Academy, must soon expand to the proportions of a college. This it did in 1866 and Hope College took its place among the flourishing institutions of the West. A "board of education" to assist indigent and godly young men in pursuing their studies for the ministry was one of the early conceptions of the Church, and put in practical form in 1828. Later in 1865 the board was empowered by the Synod to co-operate with the Classes in the establishment of academies and classical schools.

The Dutch Reformed Church early imbibed the missionary spirit. Its home work was coincident with its history. As early as 1790, much work was done in scattered fields—in Canada, and later, in the Middle States and the West. "The Missionary Society of the Dutch Reformed Church," organized in 1822, had all the missionary work of the Church under its care. In 1844

DUTCH RUSH — DUTCH WEST INDIA COMPANY

it took the name of "The Board of Domestic Missions," and much of the increase in the number of churches is due to its work. The Church did its Foreign Mission work through the American Board, beginning in 1832 and continuing until 1857, when it began its independent work. As the Board of Foreign Missions of the Church, it has had since that time in its several fields 200 missionaries. It has fields in India, China, Japan and Arabia, employing 80 missionaries, 350 native helpers, 27 native ministers, with 40 churches and nearly 5,000 communicants. One of the most invaluable helpers in this work was the organization of the Woman's Board of Missions in 1875, since which time it has contributed toward the general work more than \$600,000. Its contributions in 1900-1 were more than \$34,000. The young people of the Church are also organized in Christian Endeavor societies, co-operating with such societies everywhere in their work in the world. See CHURCH; PRESBYTERIAN.

REV. EVERT VAN SLYKE.

Dutch Rush, a common name for the scouring rush or shave grass (*Equisetum hyemale*), a plant of the horsetail family, used for scrubbing floors in country places, and imported from Holland as an article of commerce, to be used in polishing hard woods and alabaster. The stems are filled with silica deposited in a regular manner, forming an integral part of the plant. It is native throughout Europe, Asia, and nearly the whole of North America, where it is found in wet places, and along the banks of streams. See *Equisetum*.

Dutch School. See PAINTING.

Dutch in the United States. Holland's one effort at colonizing the northern New World was along the coast strip between the Hudson and Delaware (then known as North and South Rivers). Thence they penetrated inland, striking first of all up the Hudson to Albany, to establish fur-trade with the Indians, and thence westward to Schenectady; spreading east and west from New Amsterdam (New York), to the Connecticut settlements and on Long Island, and into New Jersey. They made a grasp at the Connecticut River, but were soon driven off it. The Delaware was fiercely contested with them by the Swedes, who left a strong impress there (see DELAWARE, *History*), but in vain; and the western side of New Jersey has considerable Dutch blood and settlement as well as the east, with not a little in Pennsylvania and Delaware. The English took all their possessions from them in 1664 (see NEW YORK, *History*), but of course did not root out their blood or traditions. The contribution of the Dutch to American institutions has been the subject of keen debate. Enthusiastic writers have credited them with pretty much everything distinctive of American institutions; partly and largely through the residence of the Pilgrims in Holland, it being assumed that the Pilgrims were unable to originate even such primitive ideas as that of confederations for protection except by imitating Holland; partly through the study of their institutions by the statesmen of the Constitution period. Democracy and religious freedom, written constitutions and the ballot, free religion and free schools, equal inheritances and state recording of deeds, have all been traced to

their example. Some influence on the Pilgrims is more than probable, especially in technicalities like the recording of deeds; and in the form of some few others there are significant similarities. But the wholesale character of their advocates' claims injures their cause. Democracy and equal inheritances were the result of the nature of the settlements; free schools existed among the Huguenots as well as the Dutch, and the people colonized on the basis of religious exposition of a book must train children to understand that book; the ballot is centuries older than Holland, and a written federal agreement was needed as security for its being kept. The extreme view is taken by Douglas Campbell, 'The Puritan in Holland, England, and America' (1892); a more moderate one by John Fiske, 'The Dutch and Quaker Colonies in America' (1899).

Dutch West India Company, The, an association of merchants of Amsterdam, Zealand, the Meuse, North Holland, and Friesland, incorporated 1621, with a capital of 6,000,000 florins (about \$2,500,000). Unlike the East India Company, which was primarily a trading association, and in its conquests and colonies had no other purpose than to protect its commerce, the West India Company never had an extensive trade, but strove to injure the Spaniards, to conquer their establishments, to capture their ships, and to break the intercourse between Spain and its American gold and silver mines. The design was conceived in the interest of the Belgians, when Spanish persecutions had driven more than 100,000 Protestant families from Belgium to the north. It was thought that the Spaniards would be compelled to evacuate Belgium when their resources had been thus destroyed. Large fleets were sent out, the company possessing sometimes as many as 70 armed vessels. The prizes captured were of such value that during several years shareholders received 25 to 75 per cent interest. Twelve millions were added to the original capital. Spain and Portugal being united at this time (the union lasting from 1580 to 1640), the company not only captured the Spanish silver fleet in 1628, securing a booty of more than 14 million florins, but took Bahia (1624) and Pernambuco (1630) in the Portuguese colony of Brazil. The history of Dutch Brazil had a brilliant period (1636-1642) under the administration of Count John Maurice of Nassau. Curaçao was taken about this time, and the company's North American colony of New Netherlands grew more and more prosperous. But the fatal defect of the company's plan now became apparent. Not being supported by extensive trade, the military and naval triumphs cost much more money than they produced. The financial condition of the company showed, after 1630, a terribly constant downward tendency; the government of Holland, moreover, was very slack in fulfilling its pledges of assistance. The beginning of the end was reached in 1641, when Portugal, having shaken off the Spanish yoke, devised means to regain Brazil. In 1654 the Dutch troops withdrew from that part of South America. The death-blow was struck when New Netherlands, the last valuable possession of the practically bankrupt company, was conquered by the English (1664). Consult: Asher's 'Bibliography of New Netherland and

DUTCH WEST INDIES — DUTY

the Dutch West India Company,' Amsterdam, 1856-67.

Dutch West Indies, The, islands of the Caribbean Sea belonging to Holland. They are: Curaçao (area 210 sq. miles, pop. 28,187), the capital of which, Willemstad, is the residence of the governor of all these small Dutch possessions; Buen Ayre (area 95 sq. miles, pop. 4,399); Oruba; one half of St. Martin (total area 38 sq. miles, total pop. 3,724); Saba (area 5 sq. miles, pop. 2,065); and St. Eustatius (area 8 sq. miles, pop. 1,613). The last three are members of the outer and inner Caribbean chains, and lie 300 miles northeast of the Curaçao group, which is near the Venezuelan coast.

Dutchman, The Flying, a phantom ship which sailors believed could often be seen about the Cape of Good Hope. The story is that a Dutch captain, Vanderdecken by name, being tossed about by adverse winds while trying to double the Cape, swore with many oaths that he would accomplish his purpose if he beat to and fro till the judgment day, and as a punishment his ship never touched land. Another version of the legend is that the Flying Dutchman is condemned to wander the seas forever because a murder was committed on board his ship.

Dutchman's Breeches. See DICENTRA.

Dutchman's Pipe, a common name for *Aristolochia macrophylla*, a plant of the birthwort family (*Aristolochiaceæ*). It has a twining stem, with very slender branches, the leaves broad and thin. The calyx tube is bent in such a manner that the flower suggests a pipe with a long stem. It grows in woods from southern Pennsylvania to Minnesota, Kansas, and Georgia. See ARISTOLOCHIA.

Dutra E Mello, Antonio Francisco, ãn-tõ'-nẽ-õ frãn-thẽ's'ko doo'trẽ ã mẽ'l'lo, Brazilian poet: b. Rio Janeiro 8 Aug. 1823; d. 22 Feb. 1843. His verses are considered among the best of South American poetry. Among his choicest works are: 'A'noite Inspiração Poética'; 'A'noite de S. Toão'; and 'Historia Critica da Lingua Latina.'

Dutt, doot, Romesh Chunder, East Indian scholar and civil servant: b. Calcutta 13 Aug. 1848. He was educated at Presidency College, Calcutta, and University College, London, at which latter institution he is lecturer on Indian History. He joined the Indian civil service in 1871, becoming a divisional commissioner in 1894, the first native of India to attain that position. In 1892 he was decorated for ability as an administrator, and his literary researches. Beside a series of novels in Bengali, and translations of the 'Rig Veda,' etc., into Bengali, he has published in English: 'Civilization in Ancient India'; 'Lays of Ancient India'; 'Mahabharata,' condensed into English verse; 'Ramayana,' condensed into English verse; 'England and India, 1875-85'; 'Famines in India'; 'Economic History of British India'; 'Lake of Palms: a story of Indian domestic Life.'

Dutt, Toru, Hindu poet: b. 1856; d. 1877. She received a good European education, and translated into English many French poems—from Béranger, Gautier, Coppée, etc. A collection of these was published as 'A Sheaf Gleaned in French Fields' (1876). She also rendered

into English some of the 'Ancient Ballads of Hindustan.' She wrote in French a story: 'Miss d'Arvers' Diary.'

Dutteeah, doot'tẽ-ã, Dattiya, or Datia, India, city, capital of a State of the same name, in the Bundelkhand Agency, on the route from Agra to Saugor, 110 miles southeast of Agra. The rajah's palace is situated within a pleasure ground of about 10 acres, inclosed by a lofty wall, with embattled towers at each of its four corners. A few miles distant are Jainas temples. (See JAINAS.) Pop. 27,566.

Dutton, Clarence Edward, American soldier and geologist: b. Wallingford, Conn., 15 May 1841. He was graduated at Yale in 1860, and two years afterward became captain of the First Connecticut Volunteers. He received a commission as second lieutenant in the United States army in 1863, and was promoted to the rank of major in 1890. In 1875 he joined Maj. J. W. Powell in the United States survey of the Rocky Mountain region; in 1879-80 was secretary of the United States land system committee, and from 1880 to 1891 was a member of the United States Geological Survey. He was elected a member of the National Academy of Sciences in 1884. His writings embrace the subjects of metallurgy, gunnery, and geology, to which last he has devoted his main literary attention. His most important geologic works are: 'Geology of the High Plateaus of Utah' (1880); 'Tertiary History of the Grand Cañon District' (1882); 'Hawaiian Volcanoes' (1884); 'Mount Taylor and the Zuni Plateau' (1886).

Dutton, Edward Payson, American publisher: b. Keene, N. H., 1 Jan. 1831. He was educated at the Boston Latin School, entered the book business, and was a member of the Boston firm of Ide & Dutton, 1852-8. Having acquired the publishing interests of Ticknor & Fields, and of the General Protestant Episcopal Sunday-School Union & Church Book Society of New York, he consolidated the enterprises and founded the New York firm of E. P. Dutton & Co.

Dutton, Henry, American jurist: b. Plymouth, Conn., 12 Feb. 1796; d. New Haven, Conn., 12 April 1869. He was graduated at Yale in 1818, and became professor of law in the same university in 1847, occupying this position for 8 years, and in 1854 was elected governor of Connecticut. He was judge of the superior court, and court of errors 1861-6, and prepared many digests and compilations of State statutes, which are of permanent value to his profession.

Dutton, Samuel Train, American educator: b. Hillsboro, N. H., 16 Oct. 1849. He was graduated at Yale, 1873, and was superintendent of schools in Brookline, Mass., 1890-1900. He was a lecturer on pedagogy at Harvard, 1895-7; Chicago University, 1897; Vassar College, 1897-8; and Boston University, 1898. In 1900 he was appointed professor of school administration, and superintendent of Teachers' College School, in connection with the Teachers' College of Columbia University. He has written: 'Social Phases of Education,' and several school textbooks.

Duty, a tax or impost levied upon imports and frequently upon exports. In the United States duty payment is in the nature of a tariff levy, and is determined largely by the appraised

value of the dutiable article itself. The list of dutiable articles is very large in the United States, France, Germany, and Russia. It is small in England. Merchants who have occasion to pay duty usually enlist the services of a custom-house broker, who is charged with the protection of his client's interests. Duty payments to the United States may in certain cases be deferred, the imported articles being held in bonded warehouses by the government. The stamp duty is a well-known tax in Great Britain. At the close of the Civil War and for a short time after the Spanish-American war, the United States levied a duty to meet war indebtedness by taxing medicines, matches, and other proprietary articles. See CUSTOMS DUTIES; STAMP TAX; TARIFF; etc.

Duumvirs, dū-ūm'vĕrs, among the ancient Romans, two magistrates, or officers, appointed for a particular purpose. They were therefore of various sorts, and were specially named from the nature of their functions. The *duumviri juri dicundo* were the highest magistrates of colonies, and towns, where they had the rank of consuls at Rome. The *duumviri navales* had charge of the construction and equipping, and sometimes of the command of fleets. The *duumviri quinquennales* were the censors of municipal towns.

Duval, dū-vāl, Alexandre, French dramatist: b. Rennes 6 April 1767; d. Paris 10 Jan. 1842. He served in the French fleet during the American Revolutionary War, and on his return to France was an engineer and architect; but finally devoted himself to writing plays, which won great favor from their skilful construction, interesting situations, and fine dialogue. The best are: 'Edward in Scotland' (1802); 'The Domestic Tyrant' (1805); 'The Youth of Henry Fourth' (1806); 'The Chevalier of Industry' (1809). He wrote the text of the very successful opera, 'Joseph in Egypt' (1807).

Duval, Claude, English highwayman: b. Domfront, Normandy, 1643; d. London 21 Jan. 1670. He went to England at the Restoration, in the train of the Duke of Richmond. Taking soon to the road, he robbed many gentlemen of their purses, and ladies of their hearts, till, having been captured while drunk, he was hanged at Tyburn, and was buried in the central aisle of Covent Garden Church.

Duveneck, dū'vĕn-ĕk, Frank, American artist: b. Covington, Ky., 1848. He began his artistic education as pupil in the studio of Dietz, at Munich, making a specialty of portraits and genre. Many of his pictures are in this country, although he has lived much abroad, and since 1881 has taught and painted at Florence, Italy. He was awarded a medal at the Columbian Exposition of 1893.

Duvergier de Hauranne, Jean, zhŏn doo-vĕr-zhĕ-ā dĕ ō-rān, French theologian: b. Bayonne 1581; d. Paris 11 Oct. 1643. At the University of Louvain, where he studied theology, one of his fellow students, and his most intimate friend, was Cornelius Jansen (q.v.), after whom a certain system of theological views is named — "Jansenism." The two friends, after both had left the university, continued their intimate relations, first at Paris, then at Bayonne, where Duvergier had been appointed to a prebend. When Jansen left Bayonne Duvergier resigned his prebend, and went back to Paris. All

this time the two men had diligently been studying the ancient fathers of the Church, and in particular St. Augustin, from whom Jansen claimed to have drawn his doctrine of Divine Grace. In Paris Duvergier's winning personality and his reputation for austere views of religious and moral obligations, commended him to the favor of the bishop of Poitiers, who gave up to him the monastery, or abbey, of St. Cyran, and there Duvergier, having brought together a number of devout men, formed them into a convent of monks, under the ancient, unamended rule of St. Benedict. But his zeal for reform of the monastic life was suspected of being inspired by a secret hostility to the Church and the Church's rulers, and Duvergier was compelled to retire from St. Cyran, whence he returned to Paris. There he was received with great favor by the highest society, especially the feminine element, and in particular he became the trusted counsellor of Angélique Arnauld, abbess of Port Royal, and all the members of the remarkable Arnauld family, those staunch defenders of Jansenism (see ARNAULD). A sect was formed and Cardinal Richelieu had strong suspicions that the Abbé of St. Cyran was leader in a conspiracy against Church and state; so he was arrested by order of the cardinal, and committed to the Castle of Vincennes 14 March 1638, where he was held in close confinement as long as Richelieu lived, or till December 1642; and he survived his liberation only a few months.

Duvergier de Hauranne, dū-vĕr-zhĕ-ā dĕ ō-rān, Prosper, French publicist: b. Rouen 3 Aug. 1798; d. Paris 22 May 1881. He went to London, and became in 1824 a constant contributor to the *Globe*. He was elected deputy from Sancerre, and in the national assembly he supported Casimir-Perier, and Thiers, while opposing Guizot, who had been his friend and associate on the *Globe*. After the *coup d'etat* of Napoleon III. he was imprisoned for a while, and eventually sentenced to banishment, but was subsequently allowed to return to Paris. He became a member of the Academy in 1870 and among the works which won him reputation is to be mentioned 'Histoire du gouvernement parlementaire en France' (10 vols., 1857-70).

Duvernoy, Georges Louis, zhŏrzh loo-ē dū-ver-nwā, French naturalist: b. Montbéliard 6 Aug. 1777; d. Paris 1 March 1855. In 1802 he was invited by Cuvier, to whom he was related, to assist in editing his treatise on comparative anatomy. With the aid of the notes and counsels of his master, he prepared the last three volumes of this work, embracing the organs of digestion, respiration, circulation, generation, and the secretions. In 1827 he was elected professor of the faculty of sciences at Strasbourg, where, during 10 years, he published a variety of papers on anatomical subjects; and after the death of Cuvier was engaged in arranging his papers for publication. In 1837 he was elected professor of natural history in the College of France. He published numerous works, which have furnished important materials to anatomists and zoologists.

Duyckinck, dī'kĭnk, Evert Augustus, American author: b. New York 23 Nov. 1816; d. there 13 Aug. 1878. Graduating from Columbia College, he studied law, was admitted to the bar in 1837, and went to Europe for a year, after which he devoted himself to literature, in

DUYCKINCK — DWARFED TREES

which he was fertile and successful. With his brother, George, he prepared the 'Cyclopædia of American Literature' (1855; enlarged eds. 1865 and 1875). He was a voluminous and successful writer, and added much to the literature of his time. His last work was the preparation, with William Cullen Bryant, of an edition of Shakespeare.

Duyckinck, George Long, American author: b. New York 17 Oct. 1823; d. there 30 March 1863. He was a brother of E. A. Duyckinck (q.v.), and with him prepared the 'Cyclopædia of American Literature.' He was also the author of 'George Herbert of Bemer-ton' (1858); and 'Life of Bishop Thomas Ken' (1859).

Duzine (derived from the Dutch "dozijn"), or THE TWELVE MEN, the twelve patentees in 1677 of the Huguenot settlement on the Walkill, now in Ulster County, N. Y., and known as New Paltz (New Palatinate) from their German refuge after escaping from France. The "duzine" and their successors were the executive and legislative body of the settlement during a century.

Dvorák, Antonín, ä'n'tôn-în dvôr'zhäk, Bohemian composer: b. Mühhausen, Bohemia, 8 Sept. 1841; d. Prague, Bohemia, 1 May 1904. At first intended for his father's trade of butcher, he showed such musical ability that he was allowed to study the organ. For a time he played the tenor violin in a theatre orchestra in Prague, and was also organist for several churches. In 1873 he first made himself known as a composer by a patriotic hymn for chorus and orchestra, and not long afterward an opera of his was successfully produced. His first great success was his setting of the 'Stabat Mater,' first performed in England in 1883, which at once raised him to the rank of a popular and widely-known composer. Among his subsequent works are songs, operas, dances, symphonies, a wonderful cantata, 'The Spectre's Bride,' first performed at Birmingham in 1885, the composer himself acting as conductor, and an oratorio, 'St. Ludmilla,' first performed at Leeds in 1886 under his own direction. Dvorák is characterized by a brilliant imagination, great originality, and a rare inventive power. His 'Stabat Mater,' which betrays less of the Bohemian nationality than many of his other works, is regarded as one of the greatest works of its kind in modern music. In 1892 he was called to New York as director of the National Conservatory of Music.

Dwarf, a human being much below the ordinary size of man. Dwarfs are described by several ancient classical writers. Herodotus gives an account of a race of dwarfs living in Libya and the Syrtes, to which Aristotle and Pliny also refer. Henry M. Stanley, in his journey across Africa in 1888, came on a dwarfish race which he thought might be descended from that mentioned by Herodotus. Philetas of Cos, distinguished about 330 B.C. as a poet and grammarian, was jocularly said to have carried weights to prevent his being blown away. He was preceptor to Ptolemy Philadelphus. Julia, niece of Augustus, had a dwarf named Coropas, two feet and a hand's breadth high; and Andromeda, a fremaid of Julia's, was of the same height. The best known of modern dwarfs was

Charles S. Stratton, or, as he was popularly called, "Tom Thumb," who was 31 inches high at the age of 25. He was born in Bridgeport, Conn., and traveled extensively abroad and at home under the management of P. T. Barnum. Wherever he went he attracted great attention, even from such personages as Queen Victoria and Napoleon III. Another modern dwarf was Francis Flynn, "Gen. Mite," who was 21 inches in height at 16 years.

In Scandinavian mythology dwarfs (*Dverg*) are inhabitants of the interior of the earth, and especially of large isolated rocks. They were imagined to be dark in aspect like the caverns in which they dwelt, and were often styled "dark elves." A dwarf was set by the gods at the corner of each of the four quarters of the earth to bear up the sky; and they were named East, West, North, and South. All the dwarfs were esteemed great artists in working metals, and weapons of marvelous properties were said to be produced from their subterranean workshops. Like the Jotuns, they could not endure the sunlight, and if its rays touched them they were turned into stone. If a man met a dwarf away from his rock, and could throw steel between him and it, it was believed that thereby his habitation was closed up, and that any thing in his power could be extorted from him. In the old Norse, echo is called the "dwarf language," probably because it was thought to be produced by the dwarfs within mountains imitating the sounds which they heard without.

Dwarf Snake, a common name for small snakes of many genera, given in the United States to species of the genus *Carphiophis*, which are found in the South in old logs. They are brown above and yellow or salmon below. The name is also applied to a pretty little snake of the genus *Haldea*, small and slender with coloring similar to the dwarf snakes of the first genus, but with a dark brown band across the head. It destroys insects and is harmless.

Dwarfed Trees, a favorite ornament for dwellings among the Japanese and Chinese, who adopt a peculiar method of dwarfing. They choose some fruit- or flower-bearing branch of any tree of which they wish to produce a dwarf specimen, and cutting off a ring of the bark, surround the stripped part with clay, which they keep moist by means of a covering of moss, which is watered when it becomes dry. After a period, varying in different trees from about 3 months to 2 years, roots are sent out by the branch into the clay. The branch is then cut off below these artificial roots, and planted in a poor soil, where it is kept scantily supplied with water. In this state the tree will remain for years, with vitality enough to produce leaves and even flowers annually, but never producing any but abortive shoots. Another method is to plant trees in flower-pots with a shallow covering of soil, supplying them, as in the former case, very sparingly with water, and pinching off all the strongest shoots. Still another method, which is said to give good results when tried by amateurs, is to enclose a seed in a small pellet of earth which is placed in the centre of a ball of absorbent moss, then is crowded into the interior of an orange from which the pulp has been removed. The moss is liberally supplied with water until the roots appear on the outside of the orange, when they

DWARKA — DWIGHT

are cut off and the orange-skin covered with varnish, and placed in a flower-pot. Thereafter only enough moisture is applied to support the life of the plant.

Dwarka, dwār'kā, India, a maritime town of the district of Guzerat, on the west side of the peninsula of Kathiawar, in the dominion of Baroda, 235 miles southwest of Ahmedabad. On an eminence overhanging the seashore stands a great temple of Krishna, visited annually by 10,000 pilgrims. Dwarka is claimed as the birthplace of Krishna. Pop. 5,121.

Dwight, Benjamin Woodbridge, American educator and author: b. New Haven, Conn., 5 April 1816; d. in 1889. He was graduated at Hamilton College, New York, in 1835, and became a teacher, being engaged, during a large part of his life, as principal and proprietor of a school in Brooklyn and New York, in preparing boys for college. Among his works are: 'The Higher Christian Education' (1859); 'Modern Philology' (1864); and 'The True Doctrine of Divine Providence.'

Dwight, Edmund, American merchant: b. Springfield, Mass., 1780; d. 1849. He was graduated at Yale in 1799, and became the head of a flourishing business at Chicopee, and Holyoke. He was one of the main agents in establishing the Massachusetts State Board of Education, and the normal school system of the State.

Dwight, Francis, American educator: b. Massachusetts 14 March 1808; d. 15 Dec. 1845. He was graduated at Harvard College in 1827 and at the Law School in 1830; traveled extensively in Europe, and afterward practised law (1834-8), but in 1838 turned his whole attention to the promotion of common school education in our country, and established at Albany, N. Y., in 1840, 'The District School Journal,' under State patronage.

Dwight, Harrison Gray Otis, American missionary: b. Conway, Mass., 22 Nov. 1803; d. Shaftesbury, Vt., 25 Jan. 1862. He was graduated at Hamilton College, Clinton, N. Y., 1825, and became a missionary of the American Board of Commissioners for Foreign Missions in 1830, to the Armenians, making Constantinople the centre of his field of operations. He was abundant in his labors, and met with great success in his work. He wrote 'Researches of Smith and Dwight in Armenia,' and 'Christianity Revived in the East' (1850).

Dwight, John Sullivan, American musical critic: b. Boston 13 May 1813; d. Boston 5 Sept. 1893. After two years in the Unitarian ministry he became one of the founders of Brook Farm and was editor of its organ, the 'Harbinger.' In 1852 he established 'Dwight's Journal of Music,' in which appeared most of his scholarly musical criticisms. His best-known poem is 'God Save the State.' See Cooke, 'Biography of John S. Dwight' (1898).

Dwight, Joseph, American soldier: b. Hatfield, Mass., 16 Oct. 1703; d. Great Barrington 19 June 1765. He graduated at Harvard University in 1722; became judge of the court of common pleas of Hampshire County, Mass., and afterward of Berkshire County, and judge of probate. He was eminent both as a judge and a soldier. He commanded the Massachusetts artillery at the reduction of Louisburg in 1745 with distinction, and led a brigade at Lake

Champlain in the second French War in 1756. He was also for 11 years a member of the general council of Massachusetts.

Dwight, Nathaniel, American educator: b. Northampton, Mass., 31 Jan. 1770; d. 11 June 1831. He was a brother of Timothy Dwight the elder (q.v.) He prepared and published the first school geography ever issued in the United States, and was also the author of 'The Great Question Answered,' and 'A Compendious History of the Signers of the Declaration of Independence.'

Dwight, Sereno Edwards, American Congregational clergyman: b. Greenfield Hill, Conn., 18 May 1786; d. Philadelphia, Pa., 30 Nov. 1850. He was a son of Timothy Dwight (1752-1817). He was graduated at Yale 1803, and practised law in New Haven until 1816, when he entered upon a clerical career. He preached in Park Street Church, Boston 1817-26, and was president of Hamilton College, Clinton, N. Y., 1833-5. Among other works he published: 'The complete writings of Jonathan Edwards with a Memoir' (10 volumes 1830).

Dwight, Theodore, American journalist: b. Northampton, Mass., 15 Dec. 1764; d. New York 12 June 1846. He was a brother of Timothy Dwight, the elder. He was a well-known Federalist, a member of Congress, and wrote 'History of the Hartford Convention' (of 1814), and 'Character of Thomas Jefferson.'

Dwight, Theodore, American writer: b. Hartford, Conn., 3 March 1796; d. Brooklyn, N. Y., 16 Oct. 1866. He was a son of the preceding. He wrote: 'Tour of Italy' (1824); 'Summer Tour in New England'; 'The Northern Traveler'; 'The Kansas War' (1859); 'Life of Garibaldi' (1859); besides gazetteers, histories, and school books.

Dwight, Theodore William, American educator, jurist, and editor: b. Catskill, N. Y., 18 July 1822; d. Clinton, N. Y., 28 June 1892. He was educated at Hamilton College, and was professor of law there and subsequently in Columbia College, in each of which he founded a law school. He was elected (non-resident) professor of constitutional law in Cornell University in 1868. He was interested in philanthropic work, and served as president of the New York Prison Association, vice-president of the New York Board of State Commissioners of Public Charities, and as a member of the "Committee of Seventy," of New York. In collaboration with E. C. Wines he published 'Prisons and Reformatories in the United States,' and was associate editor of the 'American Law Register.'

Dwight, Timothy, American Congregational clergyman: b. Northampton, Mass., 14 May 1752; d. New Haven, Conn., 11 Jan. 1817. In 1769 he was graduated at Yale College, and in 1771 became a tutor there. In 1783 he was ordained as minister at Fairfield, Conn., where he opened an academy. In 1795 he was elected president of Yale College, and he also held the professorship of theology. His chief works are: 'The Conquest of Canaan,' and epic poem (1785); 'Theology Explained and Defended, in a Series of Sermons' (1818); 'Travels in New England and New York' (1821). Consult: Sprague, 'Life of Timothy Dwight,' in Spark's 'American Biography.'

Dwight, Timothy, American Congregational clergyman: b. Norwich, Conn., 16 Nov. 1828. He is a grandson of Timothy Dwight (1752-1817). He became professor of sacred literature at Yale Divinity School in 1858, and was president of Yale University from 1886 till 1898, when he resigned. He was one of the members of the New Testament Revision Committee. He published 'The True Ideal of an American University.'

Dwight, William Buck, American geologist: b. Constantinople, Turkey, 22 May 1833. He is a son of H. G. O. Dwight (q.v.). He was graduated at Yale in 1854, at the Union Theological Seminary, New York, in 1857, and at the Yale Scientific School in 1859. He has filled several educational posts in a scientific capacity, and since 1878 has been professor of natural history and curator of the museum at Vassar College. In 1891 he invented and patented a rock-slicing machine for the scientific section of minerals, for which he was awarded a bronze medal at the Paris Exposition of 1900.

Dwina, *dwēnā*, **Dvina**, or **Northern Dwina**, a river of Northern Russia, formed by the union of the Sukhona and Withegda Rivers, in the government of Vologda. It flows northwest and enters Dwina Bay, an arm of the White Sea, about 25 miles below Archangel. The whole course, from the source of the Withegda, is over 1,000 miles. Canals connect the Dwina with the Volga and the Neva.

Dyaks, *dī'āks*, or **Dayaks**, the name of the natives of Borneo. They are divided into innumerable tribes differing pretty widely in language, customs, and degrees of savageness. Physically they closely resemble the Malays, to whom they are doubtless akin, but are somewhat taller; they are intelligent, hospitable, and unsuspicious, and greatly excel the Malays in truthfulness and honesty. Many of the dialects spoken by them are little known. The coast tribes have adopted many Malay words, and some have completely adopted the Malay speech. Even the most uncivilized tribes have many ingenious arts and industries, weave cloth, make excellent steel weapons, and erect most serviceable suspension bridges with bamboo poles and withes. Their chief weapon is the blow-pipe, not the bow. The barbarous custom of systematic head-hunting is dying out, though the heads of enemies are still cherished trophies of the warrior. See BORNEO.

Dyce, Alexander, English Shakespearean scholar: b. Edinburgh 30 June 1798; d. London 15 May 1869. He was educated at Exeter College, Oxford; and, taking orders, held several curacies prior to 1827, when he settled in London, where the most of his life was passed. He was first brought to notice by his 'Specimens of the British Poetesses' (1825), which was followed by editions of Collins (1827), George Peele (1828), Webster (1830), Robert Greene (1831), Middleton (1840), Beaumont and Fletcher (1843-46), Marlowe (1850), Shirley (1833), Skelton (1843), Wotton, and Drayton, all of which were accompanied by notes and biographies of the authors. In 1840 he founded, in conjunction with Collier, Halliwell, and Wright, the Percy Society, for the publication of ancient comedies and ballads. His chief labors, however, were devoted to Shakespeare, an

edition of whose works he published in 1857; second edition, greatly improved, nine volumes (1864-67). In his 'Remarks on Collier's and Knight's Editions of Shakespeare' (1844); he pointed out several errors into which the modern commentators on Shakespeare had fallen; and in another work, entitled 'A Few Notes on Shakespeare' (1853), he pronounced very strongly against the emendations of the text of Shakespeare published by Collier, and maintained by him to belong to the first half of the 17th century.

Dyce, William, Scottish painter: b. Aberdeen 19 Sept. 1806; d. Streatham 14 Feb. 1864. In 1830 he settled at Edinburgh, where he soon became known as a portrait-painter and as a distinguished contributor to the exhibition of the Royal Scottish Academy. In 1827 he had exhibited at the Royal Academy his 'Bacchus nursed by the Nymphs.' About 1837 he settled in London. In 1836 he exhibited 'The Descent of Venus,' the subject of which was taken from Ben Jonson's 'Triumph of Love'; and in 1839 'St. Dunstan separating Edwy and Elgiva.' When the decoration of the interior of the new houses of Parliament was made a subject of competition Dyce exhibited his talents in a new light, namely, as a painter in fresco. His first fresco, 'The Consecration of Archbishop Parker,' was executed in Lambeth Palace, and was followed by 'The Baptism of Ethelbert,' in the House of Lords (1846). In 1848 he was commissioned to paint a series of seven frescoes in the House of Lords, but he only lived to complete five. Among his other pictures are: 'Joash Shooting the Arrow of Deliverance' (1844); 'Virgin and Child' (1846); 'Omnia Vanitas' (1849); 'Meeting of Jacob and Rachel' (1850); 'King Lear and the Fool in the Storm' (1851); and 'John Leading Home the Virgin' (1860).

Dyea, *dī'ā*, Alaska, an unimportant village, which was, however, important during the gold-rush, as being the starting-point of the Chilkoot Trail, a much traveled pathway to the valley of the Yukon, and the Klondike fields. The building of a railroad from Skagway (q.v.) reduced Dyea to its present insignificance. The census of 1900 gives the place less than 300 population.

Dyeing. Dyeing is the art of staining or coloring yarn or cloth. It has been practised among the eastern nations from time immemorial, and in the sacred writings, we read of the vestments of the high priest being dyed purple, and of linen cloths being dyed blue, purple, and scarlet. The famous Tyrian purple is supposed to have been discovered by the inhabitants of Tyre 1500 B.C., and immediately afterward Tyrian purple became the badge of royalty, and cloth dyed with it commanded a very high price. The Egyptians, Grecians, and Romans practised the art of dyeing, and it gradually became more widespread as civilization advanced. In earlier times dyeing was much more extensively followed as a domestic art than at present.

If the various coloring matters used in dyeing had an affinity for the fibre in its natural state, the process would be very simple. It would only be necessary to make a solution of the dye drug and immerse the goods to insure their being dyed. But so far from this being

DYEING

the case, if we except indigo and safflower, there is scarcely a dyestuff that imparts its color to goods. The greater part of the dye drugs have so weak an affinity, for cotton goods especially, that they impart no color sufficiently permanent to deserve the name of a dye. The cause of this is obvious. If, for example, we take a decoction of logwood, the color matter is held in solution by the water. By putting a quantity of cotton into this solution, the fibre becomes filled with the colored solution, and if the cotton has no power to render that coloring matter insoluble within its fibres, it is plain that by taking out the cotton and putting it into water, the coloring matter within it will be diffused in the water. In other words, the dye having no attraction for the fibre, is washed out. This primary want of affinity makes dyeing sufficiently intricate and renders it more dependent upon science. Indeed, it is only by the careful arrangement of a few chemical laws, that the dyer is enabled to turn to advantage the various coloring matters of which he is in possession. When the dyer finds there is no affinity between the goods and any coloring substance which is put into his possession, he endeavors to find a third substance, which has a mutual attraction for the cloth and coloring matter, so that by combining these substances with the cloth and then passing the cloth through the dyeing solution, the coloring matter combines with the substance which is upon the goods and constitutes a dye. This third substance used, which acts as a mediator, combining two inimical bodies, is termed a mordant, from the French *mordre*, to bite, from an idea which the old dyers had that these substances bit or opened a passage into the fibres of the cloth, giving access to the color. Although the theory of their action is now changed, the term is still continued, and perhaps farther investigation will prove the term applicable.

All the mordants with one or two exceptions are found among the metallic oxides. In order that a substance may act as a mordant, it must possess certain properties. It must have an attraction for the coloring matter so as to form with it an insoluble colored compound and it must be held easily in solution. It may also have an affinity for the fibre and a tendency to unite with it, but this property is not essentially necessary; only the first two properties are so, and they limit the mordants almost entirely to what are termed the insoluble bases, that is substances which are not by themselves soluble in water. The bases or oxides, which are in general use as mordants, and which appear to succeed best are alumina and the oxides of tin and iron. The first two are colorless and the peroxide of the latter is a light brown and imparts to white goods the buff or nankeen color which in many cases affects to a considerable extent the color of the cloth, a circumstance which must also be attended to by the dyer. Indeed, the principal part of all dyeing operations is the proper choice and application of mordants; there being a chemical union between them and the coloring matter, a new substance is formed, not only differing in properties, but differing in color from any of the originals. Consequently, a very little alteration in the strength or quality of a mordant causes a decided alteration in the shade of color. However, it gives the dyer a much wider field for

variety of shades, and, at the same time, a less number of color substances are required. As, for example, logwood alone gives no color to cotton worthy the name of a dye, yet by judicious application of a few different kinds of mordants, all the shades from a French white to a violet, from a lavender to a purple, from a blue to a lilac, and from a slate to a black, are obtained from this substance. Before any chemical union takes place between bodies, they must not only be in contact, but they must be reduced to their ultimate molecules. Mordants that are insoluble of themselves, must be dissolved in some appropriate menstrua before their particles can enter the fibres of the goods or combine with the coloring matter. In doing this the dyer must attend to the degree of affinity between the solvent and the mordant to determine what force it will exert against the mordant combining with the fibres of the cloth should there exist an affinity between them. Otherwise, a powerful mordant may be weakened by the attraction of the solvent, as for example, common alum even though much concentrated, is but a weak mordant for cotton goods owing to the great attraction between the sulphuric acid and the alumina, but if the acetic acid, which has comparatively a weak affinity for the alumina, be substituted for sulphuric acid, it becomes a very powerful mordant.

It is with the vegetable coloring matters, however, that the greatest attention must be paid to the many conditions and properties of mordants. Bi-chromate of potash is largely used as a mordant for logwood and fustic for blues, blacks, browns, and a variety of shades of color. Bi-chromate of potash, alum, and oxalic acid as mordant on wool produce with logwood a very fine navy blue, but one that is not very fast to light. Sulphate of copper is used largely as a mordant with logwood for making black on cotton. These mordants are used almost exclusively for the wool dyes. In dyeing wool either raw, woven, or as yarn, care has to be taken that the wool is thoroughly free from grease before being mordanted. This is done by passing it through either soap, sal soda, or soda ash, and then thoroughly rinsing to free it from the alkali solution. If this is not done, unevenness in the dyeing is caused as well as a rubbing off of the color. When the dyer is given a shade to match he has to take into consideration the amount of fastness required, as where goods have to be heavily fulled, unless the colors are sufficiently fast, they will full out and be spoiled. In this case only such dyes can be used as will stand this process. The quantity of dye to be used depends on the class of wool to be dyed, as the finer the quality of the wool, the more dyestuff it takes to produce the same shade. The dyer also has to study to produce the result at the lowest possible cost, both for labor and dyestuff. Machines are now manufactured which economize in the labor and a large quantity of the goods are dyed at one time. It would be generally supposed that where the dyer carefully proportioned out his dyestuff to the weight of the material to be dyed, and observed every care in reference to the mordant and heat, that the shades would come out alike. However, this is not the case, and with the greatest amount of care the shades will vary and it is necessary to use extra skill

DYEING

after the shades get off the pattern to bring them again to the shade required. The dyer, knowing full well that owing to difference in the water and the stock in the goods, besides conditions that are not always understood, that the shade is apt to vary, goes light on the dyestuff and when he finds that he is not up to the shade required, he adds such dyestuff as is necessary to give the desired result. In fact, making the shade right when it is once off the pattern requires the very best efforts and skill on the part of the dyer. The dyeing of wool is a chemical combination. On the other hand, the dyeing of cotton is a fixation of the color in the pores of the cotton. Cotton is dyed in the raw state, pieces, and yarns, and the amount of dye used to produce a given shade also varies somewhat according to the quality of the staple. In using colors requiring a mordant, sumac and antimony are used, and the amount employed is governed by the depth of the shade required.

Dyeing of Mixed Fabrics.—The coloration of textile fabrics composed of more than one kind of material generally requires two or more processes, as the plan pursued in dyeing wool is seldom capable of fixing the color upon cotton. The customary plan followed is to immerse the fabric in the requisite baths to dye the wool and then to treat the partially dyed material in the manner found suitable for cotton. Occasionally the woolen thread of the cloth is dyed of one color, and thereafter the cotton is treated so as to acquire a different shade or color. With the coal tar colors recently brought out, mixed fabrics can be dyed in one bath, thus saving much time. The dyer is now able to produce, by combination of the different colors, a great variety of rich shades on mixed fabrics, and even to dye two shades in the same fabric, by first dyeing the wool with an acid dye, then cooling down his bath and adding his cotton dye, and dyeing the cotton another shade from what was produced on the wool. In dyeing silk, care has to be taken to free the silk from all gums, and this is done by boiling off in a soap bath. Most of the dyeing is done direct and under the boil.

In communicating the deep indigo blue to woolen cloth and yarn a vat is taken about six or seven feet in diameter, and eight to nine feet in depth, and nearly filled with water, along with from 18 to 22 pounds of indigo, finely ground in water, 10 to 20 pounds of madder, 7 to 9 pounds of bran, and 9 pounds woad. After the requisite boiling, and the addition of seven or eight pounds lime to form an alkaline liquid, in which the indigo can be held in solution, the whole is well closed over with tightly fitting wooden covers. Within 24 hours the putrid fermentation of the woad and bran proceeds the result of which is to abstract the oxygen from the blue indigo, the color of which is greatly reduced, until it assumes a yellowish color, and the solution then contains indigo white. If woolen cloth or yarn, is now dipped in this liquid, it comes out of a yellow tint from the attachment of the white indigo solution. But when exposed to the air, the oxygen immediately begins to act on the white indigo, combining with it so as to form oxidized or blue indigo, and as the process of oxidation proceeds, the yarn or cloth becomes first of a greenish and then of a blue color. If the cloth be again soaked in the yellowish

solution, and subsequently exposed to the air, the depth of the blue color may be increased, step by step, till it arrives at that deep shade of blue so well known.

In the dyeing of cotton with indigo the vat is prepared differently. The indigo is first ground into a thin paste with water, and afterward placed in a vat with protosulphate of iron and milk of lime. The lime (CaO) takes the sulphuric acid (SO_3) from the sulphate of iron (FeOSO_3) forming sulphate of lime (CaOSO_3), and liberating the protoxide of iron (FeO), which immediately abstracts the oxygen from the blue indigo, reducing it to white indigo and the latter dissolves in the excess of lime present in the vat, yielding a colorless solution. When cotton cloth or yarn is dipped in this it comes out of the vat almost colorless, but on exposure to the air, the indigo becomes reoxidized and the cloth passes to a green and ultimately to a deep blue shade. The cloth or yarn is then washed in water and afterward soaked in a very dilute sulphuric acid to remove any oxide of iron remaining attached and rewashed in water, when the blue color becomes more bright and clear. Fast fulling colors dyed either in the wool yarns or pieces, are usually dyed with the alizarine colors on account of their being fast to fulling and light. These are usually mordanted with bi-chromate of potash and cream tartar for one and a half hours at a boil. Then they are thoroughly rinsed in cold water and finished in another bath with the alizarine colors. Owing to the great affinity existing between the alizarine colors and the mordanted wool, great care has to be taken to enter the bath at a low temperature and very gradually bring to the boil to insure the goods being dyed even. Extra care must also be taken that only the amount of the alizarine necessary is added to produce the shade. Cotton is now largely dyed direct. Formerly dyers were obliged to give a number of baths and even then were not able in a great many cases, to secure the brilliant shades that are now dyed in one operation. The color simply being fixed in the pores of the cotton, it is more difficult to secure a fast color on this fibre than on wool. As in the case of wool, dyeing machines are now manufactured by which the cotton is dyed both in the raw state, yarns, and pieces, which economize in the labor and enable the dyer to produce better results both as to shade and fastness. During the last few years, there has been a large addition to the coal tar dyes, thus giving cotton dyers a much better opportunity to produce brighter and faster colors. Some of these are dyed direct, and thus making a great saving of labor, besides some are very fast both to light and washing.

The yarns for carpets are dyed almost exclusively with the coal tar dyes. This is done mostly in the yarn, and are dyed direct by entering them in the dye bath, which has previously had added the color, with the proper proportion of sulphuric acid and Glaubersalt, and gradually brought to the boil, being turned by hand. The bath is generally exhausted in about three quarters of an hour. The yarns furnished the dyer are frequently of a mixed material which is dark in color and in this case, he must choose the very brightest of dyes to give the required brightness of shade. For the

finer grades of carpets, the color must thoroughly penetrate and in matching shades the dyer usually cuts his yarn and matches from the centre.

F. H. PRESCOTT,

Expert in Dyes and Dyeing, Philadelphia.

Dyer, d'ér, Alexander Brydie, American soldier: b. Richmond, Va., 1817; d. 1874. He was graduated at West Point, and joined the Third United States Artillery in 1837. He served in the Florida War of 1846, and was brevetted captain for gallant conduct. During the Civil War he was appointed chief of ordnance at Washington with the rank of brigadier general. In 1865 he was brevetted major general in the regular army.

Dyer, Sir Edward, English poet and courtier: b. Sharpham Park, Somersetshire; d. in London May 1607. An elegant courtier, he advanced himself in royal favor by court verse and was knighted in 1596. He will be longest remembered by his poem, 'My Mind to Me a Kingdom Is.' His works, 'The Shepherd's Conceit of Prometheus' and other poems, were not collected until 1872.

Dyer, Eliph'ale, American jurist: b. Windham, Conn., 28 Sept. 1721; d. there 13 May 1807. He was graduated at Yale College in 1840 and began law practice in 1745. During the French War of 1755 he commanded a Connecticut regiment; was elected a member of council in 1762; chosen delegate to the Stamp Act Congress in 1765, and served as a member of Congress during the War of Independence.

Dyer, George, English antiquary and scholar: b. London 15 March 1755; d. there 2 March 1841. He was educated at Cambridge, and from 1792 till his death lived by literary work in London. He edited 'Valpy's Classics' and among other writings, published a 'History of the University and Colleges of Cambridge' (1814). Talfourd refers to his 'simplicity of nature, not only unspotted by the world, but almost abstracted from it,' and speaks of him as "breathing out at the age of 85 the most blameless of lives, which began in a struggle to end in a learned dream."

Dyer, John, English poet: b. Aberglasney, Carmarthenshire, Wales, 1700; d. 24 July 1758. He was originally a painter and his sense of beauty in scenery is shown in his 'Grongar Hill,' a poem published in 1727. He took holy orders in 1740, and received the living of Calthorpe, Leicestershire, in 1841, but eventually settled in Lincolnshire. He published 'Ruins of Rome' (1840); and 'The Fleece' (1857), by which latter poem he is best known.

Dyer, Louis, American writer and lecturer: b. Chicago 30 Sept. 1851. He was educated in early years in Chicago, Switzerland and France, was graduated from Harvard in 1874; and afterward studied at Balliol College, Oxford. He was assistant professor of Greek at Harvard (1881-87), and settled at Oxford in 1890, where he was lecturer at Balliol College (1893-96). He has lectured before the principal colleges of this country and published among other works 'Studies of the Gods in Greece at Certain Sanctuaries Recently Excavated' (1891).

Dyer, or Dyar, Mary, American martyr: d. Boston 1 June 1660. She was a victim to the persecution which befell the Quakers in the

early history of Massachusetts. The government of Massachusetts by a statute excluded Quakers from the bounds of that colony, and sentenced to death any one of that sect who should be guilty of a second visit there. The statute was little regarded, or rather was construed as an invitation instead of a menace, by the enthusiastic and devoted believers against whom it was directed. Mary Dyer had departed from the jurisdiction of the magistrates upon the enactment of the law, but soon after returned on purpose to offer up her life. She was arrested and sent to prison full of joy, wrote from the gaol a remonstrance in which she pronounced her persecutors disobedient and deceived, was reprieved after being led forth to execution and after the rope had been put around her neck, and was against her will conveyed out of the colony. She speedily returned, and suffered as a willing martyr, being hanged on Boston Common.

Dyer, Nehemiah Mayo, American naval officer: b. Provincetown, Mass., 1839. He enlisted in the navy in 1861 and was promoted for gallantry in the Civil War, having attained the rank of volunteer lieutenant by 1865. He rose steadily through the grades to that of captain in 1897, and took part in the battle of Manila Bay the following year; was promoted rear-admiral in 1901 and retired the same year.

Dyer, Oliver, American journalist and author: b. Porter, Niagara County, N. Y., 26 April 1824. He was educated at Genesee Wesleyan Seminary, Lima, N. Y. In 1848 he was appointed stenographic reporter to the United States Senate, afterward became a reporter on the New York *Tribune*, and an editorial writer on the New York *Sun*. In 1871 he engaged to write exclusively for the New York 'Ledger.' He was ordained minister of the New Church (Swedenborgian), in 1876, but resigned from his charge at Mount Vernon, N. Y., owing to ill health. He is the author of: 'The Wickedest Man in New York' (1868); 'Great Senators of the United States Forty Years Ago' (1889); etc.

Dyer, Sidney, American poet and prose writer: b. Cambridge, N. Y., 11 Feb. 1814. He published a volume of poems entitled 'Voices of Nature' (1850); 'Songs and Ballads' (1857); 'Great Wonders in Little Things' (1871); 'Ocean Gardens and Palaces' (1877); 'Elmdale Lyceum' (1879); etc.; also 'Psalmist for the Use of Baptist Churches.'

Dyer, Thomas Henry, English historian: b. London 4 May 1804; d. Bath 30 Jan. 1888. He traveled and studied for years to prepare a 'History of Modern Europe' (1861); 'History of the City of Rome' (1865); and 'Ancient Athens' (1873); all monuments of learning and critical insight.

Dyer, Sir William Turner Thistleton, English botanist: b. Westminster, London, 28 July 1843. He was educated at Oxford, and beside holding other professional posts has been director of the Royal Botanic Gardens at Kew from 1885. He has edited: 'Flora Capensis'; and 'The Flora of Central Africa'; and is joint author of 'The Flora of Middlesex' (1869).

Dyersburg, Tenn., city, county-seat of Dyer County; on the north fork of the Deer River, navigable as far as Dyersburg; on the

DYER'S BROOM—DYES

Illinois C. R.R., and about 80 miles north-east of Memphis. The city owns its own electric light and waterworks plants; it contains a number of manufactories, chief of which are for flour, lumber, iron products, tobacco, and cotton and woolen goods. Pop. 3,800.

Dyer's Broom; Greenweed Woadwaxen. See DYE WEED.

Dyer's-moss, a lichen, called also archil or orchil. See ARCHIL.

Dyer's Rocket, Dyer's Weed, or Weld, a plant (*Reseda luteola*), of the mignonette family (*Capparidaceæ*). The plant is an erect herb, sparingly branched with long, narrow spikes of greenish-yellow flowers. The plant is extensively cultivated in Europe for the beautiful yellow dye it yields, and was originally grown in American gardens for the same purpose. It now grows wild in waste places, on Long Island, and in various spots near the eastern seaboard. It is known also as weld and woad.

Dyer's Weed. See DYER'S ROCKET.

Dyes, are employed in the various processes of dyeing, and when two or more are associated together, many different shades and colors are produced. The dyeing materials are procured from the mineral, animal, and vegetable kingdoms. Logwood is brought from Jamaica and from the eastern shores of the Bay of Campeachy, and on this account it is called Jamaica and Campeachy logwood. The former is much superior to the latter, owing to its having a larger percentage of coloring matter, and being of better quality, it brings a higher price. Fustic, or yellow wood, grows spontaneously in Brazil and in several of the West India Islands, where it attains to a great height and is used for producing yellow and in combination with logwood for producing various colors both on cotton and wool. There are two kinds of fustic, and to distinguish them, one is called young fustic. It is a shrub which grows principally in Italy and the south of France, where it is cultivated for the purpose of dyeing. When cut down it is stripped of its bark and broken into small pieces in which state it is met with in commerce. Quercitron is the inner bark of a tree which grows spontaneously in North America. Its dyeing properties were first made known to the public by Bancroft 1784. This gives a bright yellow orange color. Persian berries are the root of a plant growing in the Levant and south of France. They yield a bright yellow color, but are not largely used owing to the color being fugitive. Turmeric is principally brought from the East Indies. It is the root of a plant which is reduced to powder of a bright color although very fugitive, and is used for yellow, exclusively for cotton goods. Madder is a vegetable dye and rivals indigo as a dye drug not only for the beauty of the colors obtained from it, but also for the various shades it produces by combination of coloring matters. From this is made the fast turkey reds so well known. It is the root of a shrub and is cultivated in the Levant and several of the countries of Europe, including France and Holland. The East Indies also furnish a quantity. The madder not only furnishes a red but also a madder purple, orange, and brown. Archil coloring matter is procured from lichens growing on seaside rocks. The most esteemed is that which comes from the

Canary and Cape Verd Islands, but it is also found abundantly on the coasts of Sweden, Scotland, Ireland, and Wales. Camwood is another species of red-wood, imported from Sierra Leone. It produces a bright red color, which is permanent and for this reason has been largely used in the dyeing of wool, where especially fast colors were required. Barwood chemically the same as camwood, is brought also from Sierra Leone.

Indigo comes from plants growing in India, Africa, and America, called *Indigofera*, of which genus there are some 60 species. The coloring matter is found in the cellular tissue of the leaves as a secretion or juice, not however blue as we are accustomed to see indigo, but as a white substance, and is procured from the plant by fermentation. After the plant is fermented, the liquor is drawn and is agitated with paddles by the natives, until the indigo crystallizes out, when the clear liquor is drawn and indigo is taken out and pressed into blocks and dried. Latterly this has been done largely by machinery, which gives an indigo that is much purer than that made in the crude way by the natives. This indigo gives one of the most permanent dyes for standing light and for this purpose is greatly valued.

Sumac is diligently cultivated in Spain, Portugal, and some parts of Italy and Sicily. Sicily sumac is the best quality. This shrub grows to a height of about eight or ten feet. The shoots or shrubs are cut down every year close to the roots, and being dried are reduced to powder. Fine stems are often cut into small pieces and put in the powder. This is generally used when the metallic base or mordant is iron or tin and is therefore the bottom for blacks, reds, etc., for cotton dyeing. Sumac also grows largely in Virginia, and although having a very large proportion of tannin, owing to its leaving the cotton more or less stained, is not valued as highly as the Sicily and for this reason does not bring as high a price. See SUMAC.

Galls are certain species of oak excrescences, which originate in punctures made by insects for the purpose of depositing their eggs. Juice excretes from these punctures and gradually grows around the openings, varying in size from about a fourth of an inch to one inch in diameter. This substance from its resemblance to nuts and from its bitter taste is called gall-nuts. The best galls contain 26 per cent of tannin, and as they practically leave the cotton without being stained, are notwithstanding their much higher price, used where very light and bright shades are required.

Cochineal belongs to the animal kingdom, and is a small insect, largely found in Mexico, which gives a very bright crimson and scarlet. They feed on a cactus plant, which the natives cultivate around their buildings for that purpose. The insect attaches itself to the leaves of the plant and increases rapidly in number. During a season of seven months the insects are gathered three times, by brushing them off the leaves by the feather end of a quill into boiling hot water, in which they are kept for a few seconds. This not only kills them instantly but causes them to swell to twice their natural size. When taken out of the hot water, they are spread out and dried, and then packed for market. Some cultivators instead of hot water

DYES

use steam and others again place them in an oven or upon a hot plate. The difference in the cochineal is caused by these different means of killing the insects and heating them. The best sorts seem as if dusted with a white powder and are of a slate gray color. Carmine is made from cochineal.

Weld or wold is a vegetable extensively cultivated in France and many other parts of Europe, for the purpose of dyeing yellow and is found in commerce in small dried bundles; the more slender the stem the better is it considered for dyeing. Both seeds and stems are used. The coloring matter approaches very near to quercitron in chemical properties. Owing to the color being extremely fugitive, it has been largely abandoned as a dye.

The most recent discovery of importance is the extraction of color substances of great beauty from coal tar. The discovery dates back to 1826, but it was not until 1861 that they commenced to be extensively employed. Those first placed upon the market were aniline purple, violine, rosine, fuchsine or magenta, solferina, *bleu de Paris*, aniline green or emeraldine, etc. The tar consists of numerous classes of bodies of which aniline and benzole are two. Aniline is present in minute quantity, and for manufacturing purposes, means are generally resorted to for the conversion of the benzole of the tar into aniline. The coal tar colors in many instances are not only more brilliant in shade but easier of application. These are now so largely used that they are almost entirely displacing the dyes formerly employed. When first brought out, it was found that they were not able to resist the sunlight like many of the old dyes, but in recent years, great improvements have been made in this respect, and many of the coal tar dyes, as improved, are not only noted for beauty of shade but for fastness to light as well as being economical to use, and more certain in results. Some of the coal tar dyes are made in the United States, but at the present time, Germany is far ahead of all other countries in the manufacturing of these colors, and it has grown to an immense proportion; some of the German works employing as high as 5,000 people. Among the coal tar colors are the alizarines; alizarine red, blue, and yellow, which now almost entirely take the place of madder.

The so-called aniline reds are the salts of rosaniline from which we derive most aniline colors. Aniline red, under the name of fuchsine or magenta, is prepared by adding anhydrous bichloride of tin by degrees to aniline. The materials are constantly stirred during the operation to keep down the intensity of the action, and the result is that much heat is evolved. The mixture becomes pasty, then liquid and brown and as the temperature approaches the boiling point it becomes a dark, almost black liquid, which in very thin layers presents a rich, crimson color. This liquid is boiled for some time. Much water is added and the whole is reboiled so as to volatilize any free aniline and chloride of sodium (common salt) added until saturation, when fuchsine or magenta is precipitated as a golden green, semi-solid pitchy substance. Any resinous matter still remaining may be separated by digestion in benzole. This dye may also be obtained by acting upon aniline with nitrate of mercury. Fuchsine or magenta is

sparingly soluble in water and dissolves to some extent in alcohol and is insoluble in ether and naphtha. Roseine is most readily prepared on the commercial scale by adding two equivalents of bin-oxid of lead to a boiling solution of one equivalent of sulphate of aniline, and boiling the whole for a short time. On filtration, a rose-colored solution is obtained, then evaporated down to small bulk when some resin separates and the roseine is precipitated by soda or potash, and being collected on the filter can be washed and dried. This dye is readily soluble in alcohol and yields a very intense crimson color, which on being evaporated to dryness leaves a dark, metallic looking and brittle residue of roseine. It is soluble in water, but not in naphtha.

Aniline violet was the first aniline color manufactured. It was discovered by Perkin 1857. It is a sulphate of mauveine, known under the name of mauve, indisine, etc., and produced by oxidizing sulphate of aniline by bi-chromate of potassa. Tarry substances are formed at the same time, which are removed by dissolving them in hydrocarbons such as naphtha. This violet or purple is hardly soluble in water, but easily so in alcohol and sulphuric acid. The imperial purple of Girard and de Laire is obtained by heating together salt of rosaniline, magenta, for instance, with its own weight of aniline at a temperature of 350° F., for several hours. All the unaffected aniline is removed by weak acids and the purple remains. The regina purple of Nicholson is magenta heated to a temperature of from 390 to 420° F. The substance melts, evolves ammonia and a new color is produced. Blues can be obtained from these violets by washing them several times with diluted hydrochloric acid in order to dissolve all the aniline and magenta undecomposed and also a violet color. Aniline blues generally contain some violet and the violets some red shades in them. We find in the trade, blues with violet shades and violets with red or blue shades. Repeated washings will remove the violet, which is more soluble than the blue. But we must not consider the violets as simply mixtures of blue and red. The different shades are salts of rosaniline, in which hydrogen has been replaced by the radical phenyl. By varying the proportions of magenta and aniline and also the temperature various shades of violet are obtained. A true blue is prepared by adding to the mixture of magenta and aniline an organic acid or salt such as benzoic, acetic acid, or acetates. A blue thus obtained is called night blue, on account of its remaining blue under artificial light. Aniline greens are obtained by treating four parts of magenta by six of oil of vitriol, and two of water. Then 16 parts of aldehyd are added and the whole is kept at a temperature of boiling water until a few drops of the liquid give a blue color to a weak solution of sulphuric acid. The liquid is then poured into a solution of hyposulphite of soda and the green is "fixed." This green bath can be used directly for dyeing. It does not keep very long, but the color may be precipitated by tannin or acetate of soda. The insoluble compound is employed for calico printing and forming new dye baths. An iodide of ethyl green is produced by boiling Hoffman's violet with water and carbonate of soda. The liquor is treated by picric acid, a green precipitate is formed, which is washed, dried, and

sold in powder. It is soluble in alcohol, and, we believe, in water after trituration of the powder with two or three times of its weight of sal ammoniac. Aniline blacks and grays are developed on the cotton fibre itself. Lightfoot, who discovered aniline black, if black is a color, used a paste composed of chlorate of potassa, hydrochlorate of aniline, sulphate or chlorate of copper and starch enough to thicken. By the mutual oxidizing reaction of chlorate of potassa and chlorate of copper the aniline is oxidized to the degree of black. This paste was open to the objection of destroying metals. Further experiments made by Cordillot, Koechlin, and Lauth, led to these important facts, namely, that the hydrochlorate or nitrate of aniline are the only aniline salts which can produce a black, that the best aniline should be a mixture of aniline and toluidine, that the presence of copper is indispensable, and that a sulphide of copper, prepared by precipitation, will not corrode metals, and will gradually absorb the quantity of oxygen for its transformation into sulphate. If a tartrate or acetate of aniline is used, it is necessary to add to the mixture a certain quantity of sal ammoniac which will furnish the muriatic acid necessary for the transformation of the tartrate or acetate of aniline into a hydrochlorate. Aniline grays are obtained by diminishing the proportion of black producing substances of the above receipts by keeping as much free acid as in the primitive mixture for black. The maroon of M. de Laire was made by melting four parts of anhydrous hydrochlorate of aniline with one of dry aniline oil, the temperature slowly rises to 465° F. The operation is over when yellow vapors begin to appear and the mass is constantly transformed into brown. The color is soluble in water. Leucaniline brown is obtained by Koechlin in the following way: A salt of rosaniline is transformed into leucaniline by zinc powder. The leucaniline is separated from the zinc by alcohol, and this being evaporated, a tartrate of leucaniline may be formed, which is afterward transformed into brown by the oxidizing action of a mixture of sulphide of copper and chlorate of potassa.

F. H. PRESCOTT,
Expert in Dyes and Dyeing, Philadelphia.

Dyeweed, Dyer's Broom, Greenweed, or Woodwaxen, a plant, *Genista tinctoria*, the only American representative of the genus *Genista* of the pea family. The genus comprises about 80 species, natives of Europe, northern Asia, and Africa. The dyeweed is a low-branching shrubby weed, with a few yellow nearly sessile flowers. It was originally cultivated in New England gardens because of the green dye it produced, and escaping is found from Maine to eastern New York. Its medicinal value is small, although it is used in Russia as a specific for hydrophobia.

Dygasiński, dī-gās-ēn'skē, Adolf, Polish story writer: b. Russo-Polish government of Kjeby 1839. His stories are remarkable for charming descriptions of scenery; among them are: 'On the Manor'; 'From Village, Field, and Forest' (1887); 'From City and Country' (1889). He has translated works by Max Müller, Tyndall, Mill, Lewes, and others.

Dyherm, dī'hār'n, Baron George von, German poet and novelist: b. Glogau 1 Jan. 1848; d. Rothenburg, Silesia, 27 Dec. 1878. He wrote

many poems and tales of great merit; 'In the Still Hour' (1870) being a collection of his best verse; and 'From Society' (1880), and 'Heights and Depths' (1881), his ablest fictions.

Dying Declaration, a deposition made by one who is near to death. Such declarations are admitted as evidence both in England and Scotland.

Dying Gladiator, a famous work of ancient sculpture, representing the scene of a dying Gaul, and supposed to be one of a series of figures illustrating the incursion of the Gauls into Greece. The work is now preserved in the museum at Rome. It is not known whether the statue is an original or a copy, the work of Cresilas, a Grecian sculptor and contemporary of Phidias. The right arm of the statue has been restored, and it is not positively known by whom this restoration was made. The work has been credited to Michael Angelo.

Dyke. See DIKE.

Dykes, James Oswal, Scottish clergyman: b. Port Glasgow 14 May 1835. He entered the Presbyterian ministry in 1859, and in 1869 became minister of the Regent Square Church in London. Since 1888 he has been principal and Barbour professor in the Theological College of the Presbyterian Church of England. He is the author of: 'Beatitudes of the Kingdom' (1872); 'Laws of the Kingdom' (1873); 'Relations of the Kingdom' (1874); 'From Jerusalem to Antioch' (1874); 'Abraham, the Friend of God' (1877); 'Daily Prayers for the Household' (1881); 'Sermons' (1882); 'The Law of the Ten Words' (1884); 'The Gospel According to St. Paul' (1888); 'Plain Words on Great Themes' (1892).

Dykes, John Bacchus, English composer: b. Hull 10 March 1823; d. 22 Jan. 1876. He was graduated at Cambridge; ordained in 1847, and was appointed precentor of Durham Cathedral in 1849. In 1862 was presented to the vicarage of St. Oswald's in Durham. He was a joint-editor of 'Hymns Ancient and Modern,' and composed, besides many services and anthems, a number of hymn tunes, most of which are to be found in all English collections. Among these are: 'Nearer, My God, to Thee'; and 'Jesus, Lover of My Soul.'

Dynam'eter, an instrument for measuring the magnifying power of a telescope. This power is the ratio of the solar focal distance of the object glass to the focal distance of the eye-piece considered as a single lens; this being the same as the ratio of the diameter of the aperture of the telescope to the diameter of its image or disk formed at the solar focus, and seen through the eye-piece, the object of the instrument is to measure the exact diameter of this image, which can be either projected on mother-of-pearl or measured by optical means.

Dynam'ic Theory, an hypothesis broached by Kant that all matter originated from the action of two mutually antagonistic forces — attraction and repulsion. All the predicates of these two forces are attributed by Kant to motion. As applied to heat, it is a theory or hypothesis — that now generally accepted as the correct one — which represents a heated body as being simply a body the particles of which are in a state of vibration. This vibratory movement increases as the body is still more heated, and diminishes

DYNAMIC UNITS—DYNAMO ELECTRIC MACHINERY

proportionately as it more or less rapidly cools. It is called also the mechanical theory of heat.

Dynamic Units. See UNITS.

Dynam'ics (Gr. "power"), that branch of theoretical mechanics which treats of forces. It is to be distinguished from "kinematics," which treats of the various kinds of motion that are possible in a given system, without discussing the forces to which these motions are due. In this encyclopædia dynamics is treated as a sub-heading under MECHANICS (q.v.).

Dynamite (from Greek *dynamis*, power), an explosive invented by Nobel in 1866 and originally consisting of infusorial silica or diatomaceous silica, called "kieselguhr," and nitroglycerin. The kieselguhr, being composed of the siliceous skeletons of micro-organisms, is a very fine, dry powder with a great capacity for absorbing and holding liquids, and it will absorb and retain three times its own weight of nitroglycerin, so that the product contains 75 per cent by weight of the nitroglycerin, and is known as dynamite No. 1. Other grades are made by adding less nitroglycerin to the absorbent or dope. The name has now been extended to cover a great variety of pulverulent or plastic solid mixtures of which nitroglycerin is a component.

Dynamite is fired by means of a detonator or blasting cap. As the percentage of nitroglycerin in dynamites with inert bases is reduced, they become more difficult to detonate until when the nitroglycerin is below 30 per cent they can not, according to Howe, be detonated at all. This does not hold true for dynamites with active bases. Dynamite is usually put up in cylindrical brown paper wrappers, closed at each end and coated with paraffin. These cartridges or "sticks," as they are called, are usually from one to two inches in diameter and eight inches long, and they are packed for transportation in sawdust in wooden cases, there being 50 pounds in each case. The sticks are paraffined to prevent water reaching the dynamite, as this drives the nitroglycerin out of the kieselguhr dynamites and dissolves the nitrate of soda in the nitro-lignin dynamites, thereby diminishing their efficiency. Good dynamite is of about the consistency of fresh mold. It varies greatly in color according to the absorbent used, magnesia powder being snow white, kieselguhr dynamite No. 1 pearl gray to red, carbo-dynamite black, the lignin dynamites about the color of coarse brown sugar. There is usually a little sodium, calcium, or magnesium carbonate, mixed with the dope. Dynamite keeps as well as the nitroglycerin, from which it is made. It is safer than the latter, because it avoids the liquid state, while from its softness it will bear blows better. Its sensitiveness to blows increases very rapidly with the temperature, so that, according to Eissler, "at 350° F., the fall upon it of a dime will explode it." At ordinary temperatures it may be exploded by firing musket balls into the mass. The firing point of dynamite is about 180° C. (356° F.), and at this temperature it either burns or explodes. If free from all pressure, jar, vibration, or force of any kind, it burns; otherwise, it explodes. If a thin layer be placed on a plate of tin and heated over a burner the nitroglycerin volatilizes or takes fire. If the layer is of any considerable depth, say over a quarter of an inch, it explodes. This is

a dangerous experiment. When heated to any temperature less than this, it is exploded by a detonator, blow, jar, or vibration with an ease dependent on the temperature and time of exposure. When ignited in comparatively small quantities dynamite simply burns away fiercely, but with moderate and larger amounts ignition causes explosion. To safely destroy dynamite it should be treated with a solution or emulsion of an alkaline sulphide such as the spent lime from gas works. High temperatures, much below the ignition or explosion temperature, cause the nitroglycerin to exude, or in technical terms, "they will make the powder leak," hence a dynamite should be made to resist exudation at the highest temperature to which it may be exposed.

Dynamite freezes at about 40° F., and remains frozen at temperatures considerably exceeding this. If solidly frozen it cannot be detonated except with great difficulty and uncertainty, but if loose and pulverulent it may be detonated, though the efficiency is much diminished, hence when frozen it is practically useless as a blasting agent, and must be thawed or "tempered" for use. This operation requires great care and the instructions issued with each case should be closely followed. Many persons suppose that since cartridges of unfrozen dynamite may sometimes be set on fire and burned without exploding, it is safe to warm it upon a shovel, or in an oven, or to boil it over a stove, or in various other ways which usually lead to a verdict of "accidental death." It cannot be too strongly impressed upon the minds of those handling it that if dynamite or other nitroglycerin preparations are gradually warmed up to a temperature approaching their explosion temperatures they become extremely sensitive to the least shock or blow, and once that point is reached they do not simply ignite, but they explode with great violence, and further that, owing to the poor conductivity of the mass, a portion of it may become raised to this temperature and explode the whole.

Dynamite has a specific gravity of 1.5 to 1.6. In his earlier experiments with absorbents Nobel in 1863 placed gunpowder in a zinc case and filled the interstitial spaces with nitroglycerin. This might be called a dynamite with an active base, but that the nitroglycerin was greatly in excess of that existing in dynamites. See EXPLOSIVES; NITROGLYCERIN; POWDER.

CHARLES E. MUNROE,

The Columbian University, Washington, D. C.

Dynamo Electric Machinery, machinery which transforms mechanical energy into electrical energy, or which converts electrical energy into mechanical energy. A dynamo electric machine consists of two distinct parts, one of which is stationary, the other part being rotative. When the rotary element is driven by an external force and the machine develops electrical energy, it is termed a generator or a dynamo. If electrical energy be supplied to the machine and the revolving element develops mechanical energy, the machine is termed a motor. Special types of machines in which both dynamo and motor action are present are treated later.

The operation of dynamos is due to the principle of electro-magnetic induction discovered by Michael Faraday in the year 1831. He noticed that when a loop of wire of several turns was

DYNAMO ELECTRIC MACHINERY

revolved between the poles of an electro-magnet a flow of electric current took place in the wires of the loop. The rotation of the loop was about an axis perpendicular to the lines of force emanating from the pole.

The term electromotive force represents the pressure which forces an electric current through a circuit. In a dynamo its magnitude depends upon the rate of cutting of magnetic lines of force. These lines of force are imaginary and indicate the magnitude and direction of the force of a magnetic field. To continuously produce an electromotive force, continued cutting of lines of force is essential. The magnitude of the electromotive force induced in a loop which is revolving in a magnetic field is directly proportional to the rapidity with which the loop is revolved, to the number of turns of wire in the loop, and to the strength of the magnetic field. The direction of the E. M. F. induced in a loop depends upon the position of the loop relative to the poles. When one of the wires of a loop passes one pole, an E. M. F. is induced in the wire which tends to send a current in one direction; this direction changing as the wire cuts the flux at the other pole. Opposite sides of the loop pass poles of opposite polarity simultaneously, a current therefore tends to flow in one direction around the loop. The direction of the E. M. F. in the loop changes as the wires pass from a north to a south pole. When the loop is connected to two slip rings, as illustrated in Fig. 1,

FIG. 1.

and revolved, an alternating current may be obtained by attaching to the slip rings suitable collecting devices. The substitution of a two-part commutator, Fig. 2, for the slip rings will rectify the current and produce a direct current, or a current which flows continuously in one direction.

FIG. 2.

Dynamo electric machines are divided into two distinct classes, those which generate a

direct current and those which generate an alternating current. It is customary, with a few exceptions, to term the part of a machine in whose coils the E. M. F. is generated the armature, and the parts that produce the flux, the field magnets. Dynamo electric machines are further classified as to their mechanical operation into machines in which: (a) The armature revolves and the field magnets are stationary; (b) The field magnets revolve and the armature is stationary; and (c) The field and armature coils are stationary and iron core revolves. It is obvious from previous mention that a dynamo electric machine may generate either a direct or an alternating current depending upon whether it is supplied with a commutator or with slip rings. Machines termed rotary converters possess both a commutator and slip rings, their function being to convert alternating into direct current or *vice versa*. If the machine be driven by an external force, either direct or alternating current may be obtained by making the proper brush connections. The rotary converter when operated in this manner is termed a double-current generator. As the construction of the armatures of direct current machines, rotary converters, and a large number of alternating current machines is similar with the exception of their commutators or slip rings, the construction of the armature of a direct current machine will be given in detail.

Direct Current Armatures.—A direct current rotative armature consists essentially of three parts, an iron core mounted upon a shaft, a number of conductors wound upon the surface of the core or embedded in slots near the surface, and a commutator.

Core.—The object of the core is to facilitate the passage of lines of force from one pole of the field magnet to another. If this core were not present fewer lines of force would pass through the armature, and this would tend to decrease the E. M. F. generated by the machine. For equal magnetizing forces a sample of iron may carry 2,500 times the number of lines of force that would be carried if air were substituted for it.

The periphery of the armature core of large machines is usually slotted longitudinally, the purpose of which is to contain the conductors. This also tends to decrease the air space, termed the air gap, between the core and the pole faces, a thing which is very desirable.

The core is composed of iron disks punched from sheets. These disks are punched out whole for small machines, or are made in segments, the junctions of which are staggered in large machines. The disks in machines of large capacity are mounted upon a form of proper dimensions, which in turn is fastened to a spider and keyed to the shaft. The punchings are assembled with their planes perpendicular to the axis of rotation. The reason for using disks instead of a solid casting is that the iron core is equivalent to a conductor revolving in a field. Currents, termed Foucault currents, flow through the iron in the direction of the axis if the disks are not properly insulated. This current unduly heats the armature and is therefore undesirable.

Armature Windings.—The wires distributed over the periphery of the core of an armature constitute the generating part of a direct current machine. Armatures in which the windings are only upon the periphery are termed drum arma-

DYNAMO ELECTRIC MACHINERY

tures. When the core of the armature is in the form of a ring and the wires are wound in and out around the ring the armature is called a ring armature. Drum armatures are in use commercially to a greater extent than ring armatures particularly in the case of large machines. In the drum armature a greater portion of the winding is active in producing an electromotive force than in the ring armature. The ring armature has considerable wire upon the inner face of the ring in which very little electromotive force is induced.

The length of active conductor connected in series on an armature determines the magnitude of the electromotive force generated by a given magnetic field. In machines of large magnitude two volts or more are generated per foot of active conductor.

Many forms of armature winding are in vogue. The designing engineer is often called upon to design a machine of given capacity which will generate a certain pressure at a definite speed. To do this he must place sufficient wire in series to produce the required E. M. F. and this wire must be of sufficient cross-section to carry the current it will be called upon to deliver. To meet these conditions and still have an armature which is not abnormal in size often results in a very complicated series multiple winding. Machines of large capacity usually have more than one pair of poles and have brushes between successive poles around the commutator. These serve to conduct the current to the main circuit.

An economical method of winding drum armatures consists in the employment of formed coils. These coils are wound upon a collapsible form of proper dimensions and after being thoroughly insulated and shellacked are removed from the form. They are then inserted in the slots of the armature core. The distance between the two halves of the loop is nearly equal to the distance between the centres of two poles of opposite polarity. The terminals of the loop are connected to two adjacent commutator segments. The next loop is placed in slots and similarly connected, care being taken to connect the two coils in series to a common commutator segment. By this method the current tends to flow in one continuous direction. Many modifications are made to this form of winding but the principle of connecting the coils so that their E. M. F.'s will be cumulative is common for all machines. Some machines have two or more separate windings upon the same core.

Commutators.—A commutator consists of an assemblage of drop forgings, or castings of copper called segments, Fig. 3, which are thoroughly insulated from each other. These segments are assembled around a tube. The tube is threaded at both ends to receive nuts to hold the segments together. Mica is usually employed to insulate the segments from each other, from the nuts, and from the tube. In addition to its high insulating properties, mica possesses the advantage that it wears under the brushes at about the same rate that copper does. This maintains a smooth surface at all times upon the surface of the commutator. The maximum voltage between adjoining segments is seldom allowed to exceed 20 volts. Assuming that the voltage is uniformly distributed, a 240-volt machine with a closed winding would therefore have 12 bars between adjoining brushes, or for a 2-pole machine 24 commutator segments. In Fig. 3 the perpen-

dicular projection, "P," of the commutator segment protects the coils on the armature, and is made to receive the extremities of the coils of the armature windings. The wires in some cases are fastened to the lugs, "P," with set-screws and then soldered. The commutator complete is keyed to the armature shaft.

FIG. 3.

Brushes.—Carbon and copper are the two materials usually selected for brushes; carbon for high potential machines and copper for low potential machines. When a coil is entering commutation it has a current of electricity flowing in it. The direction of this current changes when the coil is commutated. The current flowing in the coil before commutation tends to keep up because of its self-induction. In the time it takes a strip of insulation to pass under the brush, the current flow in the coil must be stopped, and a current of equal value started in the opposite direction. Both operations may be done by counter E. M. F., or the current flow may be stopped by a high resistance and started by fringe flux. The transition resistance of brush to commutator usually causes a fall in the potential of about one volt for every brush. The pressure of the brushes against the commutator varies, the average value is about 1½ pounds to the square inch. The necessary area of rubbing surface of carbon brushes is one square inch for 200 amperes, and copper brushes permit of 40 amperes for the same cross-section.

Field Magnets and Field Frame.—The field magnets produce the magnetic flux in which the armature rotates. The flux is created by a current of electricity traversing many turns of wire which are wound upon iron cores. A north or a south pole is produced, depending upon the direction in which the current flows through the coil. The coils on the field magnets are connected in series and so arranged that the polarity changes consecutively from pole to pole. Modifications are sometimes made to this form of winding when it is desirable to produce a machine which will supply a three-wire circuit. The machine is then designed as a four-pole machine having two adjoining north poles and two south poles similarly placed.

The laws governing the flux of magnetic lines are similar to the laws of current flow. The flux which will flow in a magnetic circuit is equal to the magnetizing force (termed the magnetomotive force) divided by the reluctance of the circuit.

$$\text{Flux} = \frac{\text{Magnetomotive Force}}{\text{Reluctance}}$$

The reluctance of a magnetic circuit is a property analogous to the resistance of an electric circuit. To obtain a maximum flux through

DYNAMO ELECTRIC MACHINERY

an armature with a given magnetomotive force it is necessary to reduce the reluctance of the magnetic circuit to a minimum.

In the design of a generator it is often convenient to first design the armature and then obtain the magnitude of the flux which must be generated by the field magnets. Having selected a given material for a field frame, a given air gap, a given length and cross-section of magnetic circuit, the total reluctance of the circuit is determined. The reluctance varies directly as the length of the circuit, directly as the reluctivity of the material and inversely as the cross-section. Knowing the total flux and the reluctance of the circuit, the magnetomotive force is determined, and this quantity divided by 1.257 gives the number of ampere turns necessary to produce the magnetic field.

Field Coil Connections.—Dynamos and motors may be shunt wound, series wound or compound wound. In the series dynamo the

connected in series with the armature alone, its connection depending upon the percentage of compounding required. By compounding a machine the strength of the magnetic field is increased in proportion to the current generated by the machine, the percentage depending upon the number of turns in the compound coil and as to the way in which it is introduced in the circuit. If a shunt machine be not compounded, the potential falls with an increase above normal of the generator output.

Methods of Excitation.—A dynamo electric machine may be separately excited or self-excited. When self-excited, the machine builds up slowly to its normal potential, and when disconnected from the main circuit the field magnets gradually discharge themselves as the speed of the machine decreases. The polarity of a self-excited machine may become reversed or the machine may fail to generate sufficient pressure to magnetize the field magnets. Both of these conditions are serious. When the field coils of the separately excited machine are connected to

armature circuit, the field circuit, and the external circuit are all in series. Series motors are used for traction purposes as they give a large starting torque. Series dynamos are used for arc lighting, as they generate a constant current. Shunt wound machines have their field circuit, their armature circuit, and their external circuit connected in multiple. A shunt machine is designed to generate a constant potential, or when operated as a motor to run on constant potential. The field coils of a generator may be separately excited, in which case an external source furnishes the current for exciting the coils. Separately excited machines are usually employed in large power houses where it is desirable to have a flexible system, which means the ability to vary the pressure sent out on the line at any instant of time. In the United States where 8,000 horsepower generators are now in successful operation, each machine is taken as a unit and the control of the exciting current for the fields is a very important factor. The machines are separately excited; the exciting dynamo being supplemented by a bank of storage batteries as an emergency. A compound winding consists of an additional winding upon the field, this winding being connected in series with the line. It may be placed in series with the armature and the field connected in multiple, or it may be con-

FIG. 4.

an external circuit they definitely assume their proper polarity and there is no possibility of this polarity becoming reversed. In addition to this the field magnets of the separately excited machine rapidly build up to the point where the machine generates its normal potential. The disadvantage of this machine is that when disconnected from its external exciting source its fields must be instantly discharged through a bank of lamps or some other consuming device, as there is danger of the fields discharging through the insulation of the machine. A method devised by Mr. Donshea embodies the advantages of both the separately excited machine and the self-excited machine and lacks their disadvantages. The method consists of the operation of a specially devised three-part switch. Fig. 4. The single switches A and B are closed, connecting the field magnets of the generator to the source of separate excitation. The field magnets quickly

DYNAMO ELECTRIC MACHINERY

and definitely assume their proper polarity. The switch C is closed when the machine is generating the proper potential. The machine then returns power to the circuit which may be the buss bars of the switchboard. When the switch C is closed a catch on the handle engages the switch B at the point P. When it is desired to disconnect the machine from the circuit, the handle M is engaged which carries switches B and C out together. The machine is then equivalent to a self-exciting machine and the fields gradually disappear as the machine slows down.

Speed Conditions.—Consider a motor operating under normal conditions from an external supply of E. M. F. The armature of this motor is rotating in a magnetic field and therefore has an E. M. F. induced in its armature windings. The direction of this E. M. F. is such as to tend to send a current of electricity in the opposite direction to that passing through the armature under the influence of the external supply. This E. M. F. is termed the counter electromotive force. The pressure of the external source remains approximately constant, and the counter E. M. F. varies with the armature speed. As the motor is loaded its speed tends to decrease. This decrease diminishes the counter E. M. F., and a larger current is permitted to pass through the machine. The difference between the impressed and the counter E. M. F.'s divided by the resistance of the armature gives the magnitude of the armature current. It is obvious that a very large current would flow through a stationary armature of low resistance, if the armature

an induction motor, and which made possible the economic long-distance transmission of power. This motor had two great advantages over the direct current motor, in that it possessed no commutator or brushes to be cared for, and it could be operated by alternating currents. It possessed the disadvantage that there was no ready means of regulating its speed. There is considerable difference between the construction of an induction motor and that of a direct current motor. Induction motors have a revolving element whose laminations are somewhat similar to those of the armature of a direct current motor, as they fulfil the same function. The movable part of an induction motor is called the rotor, and the stationary element surrounding the rotor is called the stator. In a common form of rotor, called the squirrel cage, the inductors are insulated and embedded diagonally in slots around the periphery, and at each end of the rotor these inductors are connected together to a common ring. The coils of the stator which create the magnetic field are so wound that several out-of-phase alternating currents have their magnetic actions superimposed upon each other and thus produce a field which continually shifts. This field is termed a rotating field. The stator field induces currents in the rotor which react upon the field and cause the rotor to revolve. The motion of the rotor is not synchronous with respect to the field of the stator, but slower. The ratio of the deficit of the rotor speed to the speed of the stator field is termed the slip of the induction motor.

Safety Devices.—There are many large power houses in the United States continuously generating 40,000 horsepower and over. The units employed in these power houses range as high as 8,000 horsepower. Since the introduction of the steam turbine there has developed a tendency to increase the size of these units to 12,000 horsepower. One of these units would generate sufficient power to replace all of the electrical power developed in Switzerland. New York has under course of development and in operation power houses whose output will aggregate 750,000 electrical horsepower when completed. When the new power houses at Niagara are in operation, almost 500,000 E.H.P. will be developed. The management of many of these power houses claim to have given continuous service since first installed. They have been able to give this service to the public by having duplicate pieces of apparatus in many cases and by protecting their entire system from excessive overload and strain, and from the elements by suitable protecting devices.

Fuses.—The simplest protecting device consists of a fuse. Fuses are made in many forms. The link fuse is made in strips, or as wire of an alloy possessing a low melting point. When the current strength exceeds a certain limit, the heat developed in the fuse by the pressure overcoming the resistance of the fuse is sufficient to melt it and interrupt the service.

Circuit Breakers.—Where heavy currents have to be interrupted an electromagnetic device termed a circuit breaker is employed. This device consists of an electromagnet of low resistance placed in series with the circuit. When the current in the circuit exceeds the normal amount, the magnet attracts an armature which releases a catch, and allows a spring to open the switch governing the circuit.

were connected directly to an ordinary commercial lighting or power circuit. To prevent this large current flow, devices called starting boxes are employed for starting motors. The function of a starting box is to first complete the exciting circuit of the field magnets and then to gradually cause a rise of the impressed potential upon the armature terminals, from zero to that of the supply circuit. The latter is accomplished by gradually diminishing resistance which is in series with the armature until the speed of the machine is almost normal, when all the resistance is entirely removed.

Induction Motors.—In the year 1888, Mr. Nikola Tesla, of New York, introduced a dynamo electric machine, which is now termed

DYNAMO ELECTRIC MACHINERY

Time Limit Relays.—Generators are liable to be subjected to an excessive overload for a short period of time. This sudden variation in load often occurs in the operation of railroad trains, mining machinery, mills, and machines of a similar nature. It would be very inconvenient to have breakers open the circuit whenever these sudden variations in load occur, especially as the generators are usually designed to stand an overload of 25 per cent for half an hour, and an overload of 50 per cent for one minute. The time limit relay performs the same function that a circuit breaker does, namely, opens the circuit whenever an excessive overload occurs. There is this difference, however, between the two devices: the operation of a circuit breaker is practically instantaneous, whereas a time limit relay has a time element associated with it. This time element is adjustable and may be arranged so that the circuit will be opened after a definite interval of time following the overload. In one form the magnetic action of the relay is opposed by a bellows, or a dash-pot, which contains air. When the relay begins to operate a solenoid draws a plunger down, which in turn compresses air in a receiver. The force exerted by the compressed air is lessened by leakage. When the limit is reached, say five seconds, the circuit is automatically opened.

Reverse Current Relay.—If a generator become disabled and is unable to develop a pressure equivalent to that generated by machines linked in with it, there is a possibility of a large cross-current flow into the disabled generator from the other machines. To prevent power returning into such a machine a device termed a reverse current relay is employed which automatically cuts out the machine from the service.

Lightning Arresters.—While there is nothing that will protect electrical apparatus from a direct stroke of lightning, still means have been provided to protect apparatus from discharges occurring in its vicinity. It is customary to protect transmission lines by installing ground wires at repeated intervals along their course. One method much in use is to run a wire from the top of the transmission pole to the ground. Such wires are installed every few poles. Charges, due to lightning occurring in the vicinity of the pole line, discharge themselves over these wires into the ground in preference to traveling along the transmission line, entering the station, and destroying the generating or the receiving apparatus. As lightning frequently oscillates with a very high frequency, a few turns in the transmission wire is sufficient to impede the discharge of the lightning and make it tend to seek another path. An auxiliary path to the ground is often provided, this path being composed of a number of spark gaps in series. These gaps are traversed very easily by the high potential of the lightning and are sufficiently far apart to prevent the line potential from discharging to ground. A device of this character is termed a lightning arrester. When the lightning has broken down the gaps of a lightning arrester, there is a tendency for the line potential to continue the discharge through this path. To prevent this, one half of the gaps are shunted by a reactive coil. The induction of this coil is so adjusted that the lightning will jump the gaps, shunting the coil in preference to flowing through the coil. The line potential, however, of much lower frequency and lower

potential than the lightning, passes through the coil in preference to jumping the gaps. The result of this current flowing through the coil is to produce a magnetic field of sufficient intensity to extinguish the arc across the gaps and to restore the line to normal conditions of operation.

Central Station Economics.—It is desirable to reduce the initial cost of the production of electric power to a minimum wherever fuel is expensive and natural sources of energy, such as water-power, are absent. Such conditions are met with in many of our large cities. This reduction is accomplished by installing engines and generators of the highest efficiency, and by employing all methods which will tend to increase the efficiency of the plant. One of these methods is to directly connect the armature of the generator to the shaft of the engine. This eliminates the friction losses which would occur if belting were employed, but necessitates good speed regulation, as the pressure of a generator is directly proportional to the speed with which it rotates. It is essential for good service that the speed be regulated to within 1 per cent, otherwise lights will flicker and their use will be objectionable. Sometimes in large electric lighting systems the voltage of a given part of the system may vary as much as 5 per cent, but this variation is not continuous, and is due more to the local loading of the mains and not to the generator at the central station.

Throughout the western part of the United States much use is made of water-power for generating purposes. Power houses are situated in the bottom of ravines and are operating under heads of water as great as 2,000 feet. The famous Colgate plant on the Yuba River has transmitted power 253 miles, the longest electric power transmission in the world. Although the cost of water is small compared with the cost of coal, still the cost of electric power generated from water is not much cheaper than when generated from coal. This is due to the fact that the initial investment in a water-power plant is much greater than in a steam plant of the same magnitude. Much capital must be spent in the construction of expensive dams, waterways, and pipe lines.

Direct Current Transformers.—One of the greatest advantages of electrical energy over other forms of energy is its flexibility. It may be generated in one place, and its pressure may

DYNAMOMETER — DYSENTERY

be transformed from a low voltage to a high voltage. The electrical energy in this form may be transmitted to a distant place where the reverse transforming process occurs. The higher the voltage under which power is transmitted, the smaller need be the cross-section of the transmission line. A stationary static transformer operating upon the principle of induction, is all that is essential to transform alternating currents, but with direct current transformation, it is necessary to employ rotating apparatus. It is not considered good engineering practice in the United States to use direct current for transmission purposes. Alternating current is used for this purpose and direct current is employed for distribution. Several machines have been designed which will transform direct current from one voltage to another voltage. They are termed motor-generators, dynamotors, and boosters. A motor-generator consists of a motor and a generator coupled together upon one shaft. The speed of the motor may be varied, which will correspondingly alter the voltage generated by the dynamo. A dynamotor consists of two armature windings upon the same core, rotating in one field. The armature has two commutators, one at each end of the shaft. This type of machine has practically no armature reaction and therefore has a small tendency toward sparking. The main disadvantage of this machine is that it is impossible to vary the field strength for purposes of regulation without correspondingly altering the voltage of the dynamo. A booster is a machine used extensively to raise the potential of railway feeders. Its armature is usually placed in series with the feeder and driven by some external source of energy. When its field coils are in series with the line, it is termed a series booster, and when the field coils are connected in multiple it is called a shunt booster. The capacity in watts of a booster is determined by the product of the feeder current into the maximum change of voltage which it causes. See also **ELECTRICITY** and kindred articles.

SYDNEY W. ASHE,
Polytechnic Institute of Brooklyn.

Dynamom'eter (Gr. "power-measurer"), an appliance for determining the force required to overcome a given resistance. It is constructed in the most varied forms, according to the nature of the problem to be solved. A tension-dynamometer, such as might be used for measuring the force required to tow a vessel, is usually constructed on the principle of the steel balance, the tension that it is to measure being caused to compress (or elongate) a steel spring, whose deformation is observed by means of an index and scale, or continuously recorded by means of a pencil upon a drum that is revolved by clockwork. Dynamometers for measuring the torsional force transmitted by a shaft are commonly made by cutting the shaft in two, and uniting the separate but adjacent ends by means of a coupling which permits one of the ends of the shaft to rotate somewhat, relatively to the other end, the relative motion being opposed by a spring in the coupling, whose extension measures the twist that is communicated through the coupling. The commoner forms of dynamometer measure force, and not power. To determine the horsepower that a given apparatus is transmitting, it is necessary to know the velocity with

which the resistance is overcome, as well as the magnitude of the resistance itself. In ordinary work the velocity is observed separately, and the horsepower inferred by computation; but instruments known as "integrating dynamometers" are used to a limited extent, the computation being performed by these instruments automatically, somewhat as the area of a curve is computed by the planimeter.

Dynamotor. See **MOTORS AND DYNAMOS.**

Dyne, *dīn* (Gr. "power"), the unit of force in the centimetre-gram-second system of units. It is defined as the force that must be exerted upon a gram of matter for one second, in order to give it a velocity of one centimetre per second. The attractive force that the earth exerts upon a milligram of matter is somewhat different in different latitudes, but it may be said, for the sake of illustrating the order of magnitude of the dyne, to be about 1.02 dynes. For many purposes this is too small a unit for convenience, and a larger unit, called a "megadyne" and defined as equal to 1,000,000 dynes, is often used in its place. To the same degree of approximation as before, the attraction that the earth exerts upon a kilogram of matter may be said to be equal to 1.02 megadynes. See **UNITS.**

Dy'nograph, an apparatus used in modern railroading for testing the inequalities in the road-bed or track. It consists of a recording instrument mounted in a car and geared to the wheels thereof. An automatic pencil records the slightest roughness or inequalities, and locates them. The dynograph is in use on all the great railroads.

Dy'renforth, Robert St. George, American patent lawyer: b. Chicago 17 Oct. 1844. His early education was in the public school, but he finished it in Prussia where he began studying in 1857, and was graduated at Breslau in 1861. He took a degree in the Karlsruhe Polytechnic School after a course in mechanical engineering; he also was graduated at Heidelberg in mathematics, physics, and chemistry (1866-9). During the Civil War he served on the staffs of Gens. Rosecrans, Copeland, and Dodge. He entered the United States Patent Office 1871, resigned on Cleveland's election in 1885, and has since practised as a patent and corporation lawyer.

Dyrrhachium, *dīr-rā'kī-um*. See **DURAZZO.**

Dysart, *dī'zārt*, Scotland, a seaport in the county of Fife, on the Firth of Forth; 12 miles northeast of Edinburgh. Dysart possessed great importance in the 15th century, and was famous for collieries and salt-works. The trade is still of importance. Pop. 3,022.

Dyscrasia, *dis-krā'sī-ā*, or **Dyscrasy**, in pathology, a generally faulty condition of the body; an unequal mixture of elements in the blood or nervous juice; a distemperature, when some humor or quality abounds in the human system.

Dys'entery, a general term connoting a series of diseased conditions of the large intestine or colon (q.v.). These may be of an infectious, nervous, or chronic inflammatory origin. At the present time, it is becoming recognized that most cases of dysentery are due to some form of micro-organism, and, within

DYSLYSIN — DYSPEPSIA

recent years, a bacillus has been described by a Japanese observer, Shiga, which is thought to be responsible for a number of the cases of dysentery, both in adults and in children. Certain mild cases of dysentery have been shown to be dependent upon the pernicious activities of certain bacteria belonging to the genus *Proteus*. And it has now been known for a long time that a certain lowly organized animal form, the *Amœba*, can induce a peculiar type of dysentery known as amœbic dysentery.

The general mode of onset of dysentery of the non-amœbic form, that is particularly epidemic dysentery, is rapid, with diarrhoea following perhaps a mild constipation or alternating constipation and diarrhoea with a mucous or serous discharge. Symptoms of indigestion frequently precede the attack, and it is characteristic that diarrhoea is accompanied with much wind. The fecal movements are large, loose, very fetid and usually mixed with blood and mucus. The movements are accompanied with great pain of a colicky or grippy nature. Tenesmus, or straining, is a very frequent symptom. There is usually much general pain, some rise in temperature, loss of appetite, nausea, restlessness, and irritability. In favorable cases formed feces commence to reappear in the stools and there is disappearance of the griping and straining. In the patients in whom the disease becomes more acute, the passages become looser, watery, slimy, and of a dark red color. The odor is mawkish, and in later stages may even become putrid. The fluid that is passed consists largely of an albuminous serum with epithelium blood cells, pus cells, tissue fibres, and small sloughs, and if the disease becomes even more pronounced the stools become dark brown in color, with sloughs and blood clots, and have a distinctly gangrenous odor. These sloughs from the intestine usually indicate an extremely severe form of the disease and oftentimes the patient dies with completely relaxed anus, with subnormal temperature, shrunken features, and in complete collapse.

Amœbic dysentery is, as a rule, a more gradual form of disease. It is extremely intermittent in its course and much protracted, running on sometimes months and even years. It very frequently begins with painless diarrhoea, alternating with constipation; the stools being loose and yellowish, containing much mucus and a little blood. The patient commences to lose flesh, becomes weak and anæmic, and the complication of abscess of the liver is extremely common. Chronic dysentery is a form of chronic colitis and can be found under that head. The treatment of dysentery consists in rigid hygiene and skilled medical attendance. See AMŒBA; CHOLERA; COLITIS; ENTERITIS; ENTEROCOLITIS; INTESTINES; PARASITES.

Dys'lysin (Gr. "hard to dissolve"), an amorphous, resinous substance, having the formula $C_{24}H_{40}O_3$, and obtained from cholic acid by heating to about 600° F., or by prolonged boiling with dilute hydrochloric or sulphuric acid. It is soluble in ether, slightly soluble in boiling alcohol, and insoluble in water; and it is reconverted into cholic acid by boiling with an alcoholic solution of caustic potash. It is occasionally found in feces.

Dysmenorrhœa, dīs-mēn-ō-rē'a, painful menstruation. To constitute dysmenorrhœa, the

pain accompanying menstruation should be very distinct and persistent. Inasmuch as dysmenorrhœa is found accompanying a vast variety of abnormal conditions of the uterus and ovaries, it seems not improbable that this affection has no settled pathology, but may be associated with almost any abnormal condition within the generative apparatus of women. A vast variety of forms of dysmenorrhœa have been described, the most important of which seems to be that of obstructive dysmenorrhœa, or a mechanical form supposed to be due to some interference in the escape of the menstrual fluid. Those who suffer from dysmenorrhœa are apt to be anæmic, which anæmia in itself may be a sufficient cause for the disease. They are apt to be extremely nervous and run down. Treatment, therefore, should be directed to the supplying of the deficiency of the iron in the blood to overcome the anæmia, and the use of cod liver oil and other reconstitutives. Of the various drugs that have been used for the treatment of dysmenorrhœa those that relax muscular fibres and arterial walls seem to give the best results. This is true of a number of the newer synthetic drugs that have been employed very widely of late. As no two cases of dysmenorrhœa are due to precisely the same cause, general directions for treatment would be out of place in a work of this character, but rest in bed, free movements of the bowels, and hot water in the form of hot-water bags, or hot-water enemata, are very useful household remedies. See MENSTRUATION; OVARY; WOMB.

Dyspep'sia is that combination of symptoms that result from interference with the proper digestion of food in the stomach. Because of the taking of too much food, or unsuitable food, the mucous membrane of the stomach becomes irritated and there is set up an acute or subacute gastric catarrhal condition which prevents the proper digestion of the food. This food is apt to ferment and to decompose, and as a result, the familiar picture of acute dyspepsia may arise. In mild cases there may be nothing more than an uncomfortable feeling in the stomach, with a certain amount of depression, headache, loss of appetite and perhaps belching of wind and occasionally vomiting. There may also be accompanying intestinal symptoms, such as diarrhoea and colic, particularly in children. There may be only the familiar heartburn, due to the over-dilatation of the stomach, from the excessive gases of fermentation or putrefaction. In the more severe cases, those that last over a day or two, the symptoms enumerated may be much more intense. The distress may be marked, and the general constitutional symptoms more evident. Vomiting, loss of appetite and mental depression are much more pronounced. This is particularly true of acute gastritis, due to the excessive use of alcohol.

Very frequently, from continued errors in diet, the acute or subacute condition may become chronic so that there is a continual indigestion. Here the symptoms persist for an indefinite period, the appetite is very apt to be variable, although at times very good. Oppression after eating, which may amount to actual pain, is one of the most constant symptoms. Occasionally the pain may be pronounced when the stomach is empty. Heartburn is frequent, if not constant, the stomach is painful on pressure, the

DYSPHAGIA — DZUNGARIA

tongue is coated, there is bad taste in the mouth, there are changes in the amount of salivary secretion. Frequent belching of gas is a very common accompaniment of chronic dyspepsia, particularly of the flatulent variety. Here also the intestines suffer from distention. Nausea is more pronounced, particularly in the morning hours, and vomiting is common in the morning. Constipation is usually present, although diarrhoea may alternate with constipation, and mental depression is almost characteristic. The treatment of acute and chronic dyspepsias constitutes one of the most difficult problems in modern medicine, particularly as few patients are willing to undergo the ordeals of a rigid dietary regimen. Most cases of dyspepsia can be cured if the diet is looked after, although each case needs careful consideration from the standpoint of causation. Proper eating and proper amounts of food are the two most important features in the treatment. Most people eat too fast, and eat too much. If the food is taken slowly, observing the old-fashioned rules of counting between mouthfuls and small amounts are taken, many patients suffering from indigestion can treat themselves with success. As to the details of the dietary and as to the medicinal treatment of the condition, medical advice is absolutely necessary. One of the most pernicious of all practices in the treatment of dyspepsia is the taking of many of the patent medicines which are so blatantly advertised in the religious and lay press. As most of these so-called tonics are hardly more than alcoholic beverages, it is evident that their use is not unattended with a great deal of danger. The treatment of the constipation that is so frequent an accompaniment of chronic dyspepsia by means of the many patent pills, powders, teas, and liquids is positively suicidal. See CONSTIPATION; ENTERITIS; GASTRITIS.

Dyspha'gia. See SWALLOWING.

Dyspho'nia, roughness of sound; in pathology, a difficulty in speaking. The disorder known as "clergyman's sore throat" is a common example. Rest of the vocal organs, tonics, muscular exercise, change of scene, are generally needed to aid recovery.

Dyspnea, disp-nē'ā. See RESPIRATION.

Dys'trophies. See MUSCLES.

Dysuria, dis-ū'ri-ā, difficult or painful urination, a symptom of temporary disorder, a deep-seated disease. When dysuria is merely the result of a slight cold it can often be relieved by a dose of sweet spirits of nitre, or linseed tea.

Sometimes this symptom is the result of a stricture, or it may be caused by gravel, or stone, in which case the services of a physician should be obtained, and that without delay.

Dyveke, dü've-kē, mistress of Christian II. of Denmark: b. Amsterdam 1491; d. by poison 1517. She was the daughter of an innkeeper at Bergen, and Christian met her for the first time in the inn of her father. She accompanied the king to Denmark in 1507 and was constantly with him for the 10 years following. She is one of the most romantic figures in Danish history, and has frequently been celebrated in poetry and fiction as the victim of royal passion, and the insane jealousy of the nobility, who resented her exaltation.

Dzeren, dzē'rēn, the "goitred" yellow antelope of China (*Gazella* or *Procapra gutturosa*), with unusually pale horns, and a protruding, goitre-like crop. It is indigenous to the deserts of central Asia, China, and Tibet, and is noted for its fleetness. The name "dzeren" is Mongolian.

Dzhol, the Arabian Saturn.

Dzierzkowski, tsērts'kōf-skē, **Joseph**, Polish novelist: b. Xaverov, Galicia, 1807; d. Lemberg 13 Jan. 1865. Among his works are: 'Salon and Street' (1847); 'The Twins' (1854); 'The Jugglers' (1855); 'The Crown of Thorns' (1856); 'Polish Chivalry' (1858), a historical novel; a drama, 'The Spark of Poesy' (1860).

Dziggetai, dzig'ge-ti, the native name for the Mongolian wild horse or wild ass (*Asinus* or *Equus hemionus*), also known as the Kiang (q.v.), and sometimes confounded with the Kulan (*Equus* or *Asinus onager*).

Dzoha'ra, the Arabian Venus.

Dzungaria, dzoon-gā'rē-ä, **Ili Proper**, or **Thian-Shan-Pe-Loo**, an extensive territory in central Asia, the boundaries of which are not very well defined. Dzungaria was originally the independent empire of the Dzungars, a branch of the Mongols, but about 1754 the territory was subjugated by the Chinese, under whom it remained till about 1864, when a rebellion broke out, and the Chinese settlements in Dzungaria were completely destroyed. A period of anarchy followed, which was not put an end to till July 1871, when Kuldja was occupied without opposition by the Russians. Since then the greater portion of Dzungaria has remained in the hands of the Russians, the rest being again under Chinese rule.

E

E the fifth letter of the English alphabet, as also of the alphabets of Greek and Latin, and of all the European languages except those which, as the Russian, use the Cyrillian alphabet, where the E has sixth place. The character corresponding to E in Hebrew and other Semitic languages, as Phœnician, Samaritan, Chaldean, holds the same relative place in the alphabets of those languages. The form of the letter *he* in early Hebrew and early Phœnician was  and from that is derived the Greek Ε (epsilon), which is the Phœnician character reversed, with stem shortened and made perpendicular: this character represented in the Hebrew and other languages of western Asia, not the vowel sound E but the soft breathing. Taken into the Greek alphabet it was at first used to represent the vowel sound *e* whether short or long; but afterward the character Η was employed in Greek for the long *e* and was called *eta*, while the Ε received the name *epsilon*. The Latins used the E for both the long and short vowel and adopted the Η of the Greek alphabet to denote the aspirate. The name and sound of this letter in all European languages except English is *eh*, as in our interjection of inquiry: long *e* in those languages is invariably equal to *a* in *mate*, and short *e* equal to *e* in *met*: the long E of English is in those other languages expressed by the third vowel, I: thus, English *he*, *me*, *lee*, would in those languages be written phonetically *hi*, *mi*, *li*. In the standard alphabet employed in linguistic science the vowels *a*, *e*, *i*, *o*, *u*, are taken to represent the sounds *ah*, *eh*, *ee*, *oh*, and *oo*, and are named accordingly. The letter E occurs in English words far more frequently than any other letter of the alphabet: compared with A, I, O, U, its frequency of occurrence is as 1,000 to 728, 704, 672, 296 respectively; compared with various other letters it is as 1,000 to 770 (*t*), 670 (*n*), 392 (*d*), 280 (*c*), 236 (*f*), 120 (*b*), 22 (*s*). In frequency of occurrence as an initial letter it ranks only as eleventh and is to T as 340 to 1,194. One reason of the greater frequency of E in general use is that it often takes the place, in modern English words, of the vowels *a*, *o*, and *u* of Anglo-Saxon words; another reason is that final *e* is largely employed to lengthen the vowel of a preceding syllable, as in *there*, *here*, *cape*, *paine*: it is employed even where it serves no purpose of pronunciation at all, as in *gone*, *live*, *give*.

E as an abbreviation is used for *East*, *editio*, *emeritus*, and *ergo*; *e. g.* and *e. c.* for *exempli gratia*, and *exempli causa*.

In music E is the third tone in the key of C, and the fifth semitone in the chromatic scale.

E. C. Sporting Powder is a superficially hardened, soft-grained, smokeless sporting powder, consisting, according to an analysis by C. E. Munroe, of 53.57 per cent of soluble cellulose nitrate, 1.86 per cent of insoluble cellulose nitrate, 3.12 per cent of unconverted cellulose, 34.26 per cent of barium nitrate, 4.55 per cent of potassium and sodium nitrates, 1.17 per cent of volatile matter, and 0.55 per cent of aurine, the latter being an organic coloring matter, used to impart an orange color to the grains. The manufacture, as carried out by the Explosives Company, after the method invented by Reid and Johnson, consisted in placing the moistened, pulped cellulose nitrates and metallic nitrates in "barrels" where, by rotation, the ingredients were mixed and then broken up into rounded grains, which were dried and then sprayed with ether-alcohol which at first gelatinized the surfaces of the grains, and then by evaporation left a hard skin about the grains. The coloring matter was added in the solvent.

E Pluribus Unum, ē ploō'rī-bus ū'nūm ("one from many"), the motto of the United States; chosen for its Great Seal 10 Aug. 1776, by Franklin, Adams, and Jefferson, as a committee. It has been part of the motto of the 'Gentleman's Magazine,' founded 1731; apparently taken by it from a sentence in Virgil's (?) 'Moretum,' "color est e pluribus unus."

Eachard, John, D.D., English clergyman: b. Suffolk, England, 1636; d. Oxford 7 July 1697. He became a Fellow of Catherine Hall, Cambridge, in 1658, and master in 1675. His writings include: 'The Ground and Occasions of the Contempt of the Clergy and Religion Inquired Into' (1670), and a 'Dialogue on Hobbes's State of Nature' (1672). He was a writer of considerable humor, but of no great ability.

Eadie, ē'dī, John, Scottish religious writer: b. Alva, Stirlingshire, 9 May 1810; d. Glasgow 3 June 1876. He wrote on theology with great vogue among the unlearned; his books including: 'The Divine Love' (1855); 'Paul the Preacher' (1859); etc.; in addition to scholarly treatises and commentaries.

Ead'mer, or Ed'ner, a mediæval churchman, historian of his own times and biographer: he flourished in the 11th and 12th centuries, dying at Canterbury about 1124. He was a Benedictine monk and was the companion, counselor, and friend of St. Anselm, Archbishop of Canterbury, whose life he wrote. He held a like relation to St. Anselm's successor, Radulphus, or Ralph, till 1120 when, invited to Scotland by King Alexander I., he was nominated bishop of St. Andrews; but went

back to his monastery because of a controversy having arisen over the king's right to nominate and the pretensions of the archbishops of Canterbury to primatial jurisdiction over the bishops of Scotland, which pretensions Eadmer upheld. He was even wont to say that he would refuse the highest see in Scotland if he must divest himself of his character as a monk of Canterbury. He wrote 'Historia Novorum,' that is, history of recent occurrences of his own times. Besides the life of St. Anselm he wrote the lives of three of Anselm's predecessors in the primatial see—St. Odo, St. Dunstan, and St. Bregwyn; also the lives of St. Wilfrid, and of St. Oswald of York; all of which writings have been printed.

Eads, ãdz, James Buchanan, American engineer: b. Lawrenceburg, Ind., 23 May 1820; d. Nassau, New Providence, 8 March 1887. He early designed some useful boats for raising sunken steamers, and in 1861, when called to advise the Federal government, constructed within 100 days eight ironclad steamers for use on the Mississippi and its tributaries. He afterward built a number of other ironclads and mortar-boats, which were of considerable service to the North. He built an arch bridge across the Mississippi at St. Louis. (See EADS BRIDGE.) His works for improving the South Pass of the Mississippi delta were successfully completed in 1875-9; and his great plan for deepening the river as far as the mouth of the Ohio by means of jetties has been demonstrated to be entirely practicable. A later suggestion, for the construction of a ship-railway across the Isthmus of Tehuantepec, attracted much attention. In 1884 he received the Albert Medal of the Society of Arts, being the first American citizen to whom this honor had been awarded.

Eads Bridge, The, so named after its chief engineer, Capt. Jas. B. Eads (q.v.), is the great steel arched bridge over the Mississippi River at St. Louis, Mo. It has three spans, the central being 520 feet in the clear, and the side spans 502 feet. The rise of the central arch is 47½ feet. Each span consists of four steel ribs carrying two railways and a broad highway for teams, street-cars and pedestrians.

The bridge is remarkable chiefly in four respects: (1) The depth and size of the foundations and piers. (2) The method employed in sinking the piers. (3) The novel construction of the arched ribs. (4) The method of erection.

1. All four of the great piers stand upon the bed-rock far below the ordinary bottom of the river. The eastern river-pier extends 126½ feet below extreme high water, with a total height to the upper roadway of 199¾ feet. Its base is an elongated hexagon, 82 feet long by 60 feet wide. The east abutment pier has a larger base and a depth below high water of 134½ feet. These depths were beyond all precedent.

2. The deep piers were built upon hollow iron caissons which at first floated upon the water, and which later during the sinking were supported by the friction of the loose sand which formed the river bed, and by the compressed air in the chambers of the caissons. All the masonry was laid in the open air at or near the level of the water. The sand below the caissons

was removed by an ingenious device known as the sand pump (q.v.), invented by Capt. Eads. The difficulties encountered and overcome in sinking the piers to the rock, and in working men under several atmospheres of compressed air—form most valuable chapters in the history of bridge engineering. The air chambers were finally filled with concrete so that the piers now stand solid masses of masonry.

3. Each of the arched ribs consists of two parallel series of steel tubes, one above the other, and 12 feet apart. The tubes are 18 inches in diameter and about 12 feet long, with their ends slightly beveled so that they follow circular arcs. A tube is formed of six bars of steel inserted in a steel envelope one fourth of an inch in thickness, like staves in a barrel. Sleeve couplings and heavy braces give every rib the strength and rigidity of a continuous mass of steel. The first or springing tubes, which are very thick, are screwed into wrought-iron "skew-backs" which are fixed to the masonry by three or four steel (or wrought-iron) bolts 6¼ inches in diameter, and from 24 to 34 feet in length. Under moving loads and changes of temperature the tubes are alternately subjected to tension and compression. These arched ribs with tubular members are unique in engineering history and were the result of a vast amount of study and experiment. In construction they were very expensive.

4. The bridge was erected over a deep and rapid stream without centring and without interfering with the river traffic. The fixed end of a rib made it self-supporting while it was built out from above to about 100 feet; it was then supported by cables passing over the pier and over a temporary tower standing on the pier and by a secondary cable until the centre of the span was reached.

Recent investigations have found the bridge sufficiently strong for the heaviest locomotives and trains. When tested publicly 14 locomotives stood upon each span. Capt. Eads designed the piers, the arched ribs and the method finally adopted for closing them. Charles Pfeifer developed the mathematical theory of the arch, which was finely elaborated by Prof. William Chauvenet. The method of erection was devised by Col. Henry Flad, who gave to the whole work continued study and supervision.

Work on the bridge was begun in 1867 and finished in 1874. The cost of the bridge was about \$6,500,000. The difficulties, financial and physical, were many and great. Over 600 men were prostrated by the compressed-air work, and 13 died. The complete story with the "Theory of the Ribbed Arch" is told in 'The History of the St. Louis Bridge,' published in 1881 by the writer of this sketch. See BRIDGE.

CALVIN M. WOODWARD,
School of Engineering and Architecture, Washington University.

Eagan, Charles Patrick, American military officer: b. Ireland January 1841. In 1862 he entered the Union army as first lieutenant; in 1874 was promoted captain and commissary of subsistence; in 1892, major; in 1897, lieutenant-colonel; on 11 March 1898, colonel, and on 3 May, following, brigadier-general and commissary-general. In January 1899, he made remarks concerning Gen. Miles. In his testimony before the War Investigation Commission, for

EAGLE

which he was tried by court-martial and sentenced to dismissal from the army. His sentence was commuted by the President to suspension from duty and honors for six years. On 6 Dec. 1900, he was restored to duty and immediately afterward retired.

Eagle, James Phillips, American Baptist clergyman: b. Maury County, Tenn., 10 Aug. 1837. He was educated at Mississippi College (1870). He served through the Civil War as a Confederate in all grades from private to colonel. In the close of the War he became a Baptist minister and cotton planter in Arkansas; has been elected four times to the Arkansas legislature, served one term as governor of the State, and for years has presided over the Baptist State Convention.

Eagle, as a popular name includes several raptorial birds which vary in some respects from the strictly defined group in which science has been wont to place it. The order *Accipitres*, to which it belongs, is broad enough in definition to include all the vultures, the typical eagles, and the buzzards. Recent osteological demonstrations, however, have led to the separation of American vultures from the Old World vultures, including the latter in the family *Falconidae*, to which eagles and vultures belong. This family, which embraces 300 species of diurnal raptorial birds, is characterized by imperforate nostrils, legs of medium length, and, except in the Old World vultures, a feathered head, a bill decidedly hooked, the hind toe inserted on a level with the three front ones, and the claws roundly curved and sharp. The subfamily *Aquilinae* makes prominent the cutting edge of the upper mandible, the bony shield over the eye, the feet heavy and short, either scutellate or feathered. The Lämmergeier (*Gypaetus barbatus*), lamb-killer, or bearded vulture of the Alps, the Pyrenees, and the Himalayas, finds its nearest affinity here. The *Aquilinae* are naturally divided into two genera: *Aquila*, land eagles, and *Haliaeetus*, sea-fishing eagles. The former is feathered to the toes, the latter half way to the toes.

The leading specimen of *Aquila* is the golden eagle (*A. chrysaetus*) one of the largest and most magnificent of its kind, dark brown with purple gloss; head and neck brownish-yellow; tail rounded and dark brown, ending in light and dark tints. The length is about three feet, the extent of wing seven feet. In North America its range is from Mexico north. It is very scarce in the United States but more abundant in Canada, where it is distinguished as *canadensis*. It is regarded as a variety of the European species, which seldom occurs in England, though more prevalent in Scotland, where the demand for its eggs has favored its increase. The nest is usually placed on some inaccessible cliff, the eggs are spotted and do not exceed three. Closely allied to the golden eagle are the imperial eagle (*A. mogilnik*) of southwestern Europe and of Asia, and the king eagle (*A. hiliaca*) of the same range. The smallest of the kind is the dwarf eagle (*A. pennata*) which measures less than two feet and is native in Southern Europe, North Africa and in India.

First in interest among the sea-eagles stands the bald-headed eagle (*Haliaeetus leucocephalus*), selected as the national emblem. Its markings are familiar, though the term "bald" is to be

referred not to the absence of feathers, but to the effect produced by the white feathers on the head. In size, it corresponds nearly to the golden eagle, but it differs in its habits, living mainly upon the fish which it seizes along the sea-shore and around lakes and rivers. The nest is built on a high tree top or upon a rocky cliff. A finer specimen than this is the northern sea-eagle (*Haliaeetus pelagicus*) of northeastern Asia. It is conspicuous by its large form and bill, and by the contrast of its main color, brown, with the white of its shoulders, rump and tail. The African sea-eagle (*H. vocifer*) is a fish-eater, about half the size of the "bald-head," remarkable for its color-markings, being white on the head, neck, and breast, while the under parts and wing coverts are chestnut, and the upper parts are black or brown. Nearly related to the *Haliaeetus* is the fishing-eagle (*Polyoetus ichthyaeetus*) of India and the East Indies, with extremely curved talons, and living entirely on fish. In countries bordering on the Mediterranean and ranging into India and Central Europe, is the serpent-eagle (*Circaetus gallicus*) with short toes, white, brown-spotted under parts, and dark brown upper parts. It feeds upon reptiles, which it kills and carries away, not eating the game on the spot, as do other eagles. A buzzardlike genus, *Helotarsus*, is represented in Southern Africa by *H. caudatus*, the short-tailed eagle, ornamented with maroon and black plumage, and bright red, very short legs.

The buzzard-eagles include some species which command notice from their great size and powerful action which fairly entitle them to their name. South America, in the dense forests of the Amazon, is the habitat of the Guiana eagle (*Morphnus guianensis*) relatively small, but with a tail longer than that of almost any other species. The wings are short and rounded, adapting it to swooping down with great force upon its prey, rather than for lofty or prolonged flight. From southern Mexico through the forests of Brazil, the harpy-eagle (*Thrasaetus harpyia*) has its home, and for muscular power is scarcely surpassed by any bird of prey in the world. It is larger than the golden eagle, gray in color, with long crest feathers, a stout, vicious bill, and talons of extraordinary force and sharpness. Though rapacious and apparently destructive, the eagles are useful in killing many other birds which venture nearer to farms and human habitations, in reducing the number of injurious reptiles and small mammals, and in helping to preserve the balance of the animal world.

Eagle, a gold coin in the United States of the value of 10 dollars, or £2 1s. 8d. sterling, and weighing 258 grains troy, 900 fine. It was first coined in 1795, in accordance with an act of Congress, dated 2 Jan. 1792. There are also half eagles (first coined in 1795), quarter eagles (first coined in 1796), and double eagles (first coined in 1849), of proportionate values.

Eagle, in astronomy, name given to a northern constellation, from the bird supposed to have carried the thunderbolts of Jove. The constellation comprises stars of the first, second, and third magnitudes. The most important of these is Altair, star of the first magnitude, from which the moon's distance was once computed.

EAGLES.

1. The Golden Eagle (*Aquila chrysaetus*).
2. The Black Eagle (*Aquila melanaetus*).
3. The Pomarine Eagle (*Aquila pomarina*).
4. The Oriental Eagle (*Aquila orientalis*).
5. The Dwarf Eagle (*Aquila pennata*).
6. The Wedge-tailed Eagle (*Aquila audax*).
7. The Striped Eagle (*Aquila fasciata*).

8. The Crested Eagle (*Spizaetus occipitalis*).
9. The War Eagle (*Spizaetus bellicosus*).
10. The Harpy Eagle (*Harpyia destructor*).
11. The Screech Eagle (*Haliaetus vocifer*).
12. The White-tailed Eagle (*Haliaetus albicilla*).
13. The Baldheaded Eagle (*Haliaetus leucocephalus*).
14. The Osprey (*Pandion Haliaetus*).

EAGLE — EAMES

The name is also given to the standard carried by the ancient Roman legions. This standard consisted of a staff, with an eagle perched upon its extremity. A special band of men was appointed to precede and guard these eagles, which always led the army into battle. The French battle standard, in imitation of the Roman, is also surmounted by an eagle.

In heraldry a bearing of frequent occurrence, and often assumed by sovereigns as the emblem of empire from having been borne on the legionary standard of the ancient Romans. The United States, in 1785, adopted the bald eagle, its wings displayed, proper, as the national emblem. The eagle of Russia is *or*, with two heads, displayed, sable, each ducally crowned of the field; the whole imperially crowned, beaked, and membered gules. The eagle of Austria is also displayed with two heads. The Prussian eagle has only one head.

Eagle, Black, a term applied to the golden eagle, *Aquila chrysaetus*, also to the young of the bald-eagle. See **EAGLE**.

Eagle, Black, Order of, a Prussian order, founded by Frederick II. in 1701. The number of knights in the order is limited to 30, exclusive of the princes of the blood royal, and all members must be of unquestioned nobility. The badge is a cross of eight points having in the centre a circle with the monogram F.R. (for *Fredericus Rex*); the four arms are enameled red with the eagle of Prussia in black enamel between each two arms.

Eagle Hawk, or **Hawk Eagle** is the name for a group of some rather small and some large raptorial birds, closely related to *Aquila*, and chiefly represented by the genus *Spizaetus*. They are beautifully crested and range in South Africa, Central and South America. A notable specimen is the crowned eagle (*S. coronatus*) of South Africa, of medium size, its under parts buff, banded with black, the head furnished with a crest of long, brown feathers. Of the same geographical range is a species of *S. (Lophoaetus) occipitalis*, a small bird with a crest four inches long. In Central and South America are crested members of the group, *S. (Lophotriorchis) isidori* and *S. ornatus*.

Eagle Owl, an owl of the genus *Bubo* (family *Strigida*, horned owls, order *Accipitres*, represented in nearly all parts of the world except Australia. Of rare occurrence in Great Britain, it is common in the foot-hills of the Ural Mountains, and throughout Siberia as far as China. In the northern Old World *B. ignavus* is one of the largest owls, of unsurpassed strength and daring. The colors are black, brown and white, mottled. A grown specimen weighs about eight pounds and measures 26 inches from bill to end of tail; the wing is 18 inches long, and the plumage feathers, constituting the horns, are nearly 4 inches in length. It is the boldest and most ravenous owl, and is a match for the eagle. To the superstitious people of the north, its weird call-note sounded at night in the depths of the forest announces the presence of evil spirits. The great horned-owl of America (*B. virginianus*) bears a general likeness to its European congener, though smaller in length of body and wing. The colors are the same but differently arranged. The lower parts are barred rather than spotted, the breast and throat are marked with a large white patch, and a

black ring is stamped on the disk of the face. Like the European species, it preys upon hares, large ground birds, rats, mice, reptiles, and fish, and besides on the young of the American turkey.

Eagle Pass, Texas, town, county-seat of Maverick County; on the Rio Grande River; the Mexican I. and the S. P. R.R.'s; about 155 miles southwest of San Antonio. It is a trade centre for a coal mining and cattle section, and the shipping of cattle, hides, and wool is steadily increasing. It contains large brick and lumber yards. Pop. 3,200.

Eagle Ray, a fish of the order *Raia*, of which the torpedo and the sting-ray are familiar members, and associated with the sea-devil in the family *Myliobatida*. It is a flat fish with a very broad disk distinguished by pectoral fins which continue to the snout and then reappear at the extreme end of the head. The tail is long and slender like a whiplash. The teeth are flat for crushing crabs and for grinding shells. Though much smaller than the sea-devil, which is sometimes immense, the eagle ray often attains a considerable size. It brings forth its young alive, and inhabits tropical or subtropical waters.

Eagle, Red, Order of, originally called Order of the Red Eagle of Baireuth, and also called Order of Sincerity; founded by the Margrave of Baireuth in 1705. The badge is an eight-pointed cross, having in the centre a medallion with a red eagle bearing the arms of the Hohenzollern family.

Eagre, a Norse word signifying a formidable influx and surging of the tide, the same as *bore* in a river, as in the Severn and Houghly rivers and the Bay of Fundy. See **BORE**.

Eakins, êk'inz, Thomas, American artist: b. Philadelphia 25 July 1844. He was a pupil of Gérôme. He has been professor in several art schools, lecturing there on anatomy and painting. Among his works are many pictures of American domestic scenes, out-of-door sports, portraits and several large canvases, such as Dr. Gross and Dr. Agnew at their clinics. The colossal figures of the prophets, Witherspoon building, Philadelphia, were molded by him and his pupil Samuel Murray.

Ealing, êl'ing, England, town, and also a parliamentary division of Middlesex, the former a few miles west of London. The town has a free library, science and art schools, and a training college for teachers of the deaf. Pop. of town 23,979; of the parliamentary division 70,748.

Eames, êmz, Charles, American lawyer and journalist: b. New Braintree, Mass., 20 March 1812; d. Washington, D. C., 16 March 1867. He was graduated at Harvard in 1831, and began the study of law. After accepting a position in the navy department at Washington in 1845, he took editorial charge of the Washington *Union*. He was sent by President Polk as U. S. Commissioner to the Sandwich Islands, and afterward became United States minister to Venezuela, under President Pierce. Returning in 1858 he gained a great reputation as a lawyer in admiralty cases.

Eames, Emma, American operatic prima donna: b. Shanghai, China, 13 Aug. 1867. She studied music in Boston and Paris, singing in

churches and concerts in the former city, and making her début in grand opera, Paris, 13 March 1889, in 'Juliette,' appearing in grand opera at the Covent Garden, London, 1891, and in New York the same year, since which time she has been a popular member of grand opera companies in Europe and America. She married the well-known artist, Julian Story, 1891, and resides in Paris, France.

Eames, Wilberforce, American bibliographer: b. Newark, N. J., 12 Oct. 1855. He has long been prominent in bibliographical matters, having been assistant at the Lenox Library, New York, 1885; assistant librarian 1892; librarian 1893-5, when upon the consolidation of the Astor Library and Tilden Trust as the New York Public Library, Astor, Lenox and Tilden Foundations, he became librarian of the Lenox branch. He edited volumes 15-20 of 'Sabin's Dictionary of Books relating to America' (1885-92). Among his works are: 'Bibliographies of the Bay Psalm Book' (1885); of 'Ptolemy's Geography' (1886), and of 'Sir Walter Raleigh'; bibliographic notes on 'Eliot's Indian Bible' (1890), reprinted from 'Pilling's Indian Bibliographies,' and a bibliographic account of the early catechisms of New England (1898).

Ear, Anatomy, Physiology, and Disorders of the. In most of the animal creation the vibrations which we term sound have special portions of the body for their recognition, more or less precise; although in the lower forms every part of the simple organism can respond to them in some degree. The earliest separation of a distinct hearing-organ is seen in the *Medusæ*, of which the common nettle of the salt waters is a well-known example. Here we find certain of the tentacles covered with delicate cells having hair-like projections and enclosing a chalky concretion, the otolith (Fig. 1). This structure of a tiny vesicle with single or mul-

of fluid-containing sacs deserving the name of "labyrinth," in which chalky particles (often of special crystalline form) lie in close relation to "hair-cells,"—as we term these structures with their delicate prolongations. A nerve, more or less defined, passes to the sac (Fig. 3) and connects it with the sensory centres, which in the vertebrates and some of the higher invertebrates may be called brain-centres. This apparatus is in the vertebrates imbedded in the cartilage or bone on either side of the head; and in those creatures which do not live in the water, accessory apparatus

FIG. 2.—1. Otolith; 2. Hair-cells directed toward cavity; 3. Nerve-cells.

FIG. 1.—1. Hairs of the hair-cells; 2. Otolith; 3. Sensient (nerve) cells.

multiple otolithic contents (Fig. 2), connected with the more sensitive or distinctly nervous portions of the organism may be regarded as the fundamental form of the ear; as it develops, it takes on more and more complicated forms

is present to help transmit the air-vibrations to the fluid ("endolymph") of the labyrinth. As we pass up the scale of animal life the organ of equilibrium is found in relation to that of hearing; and thus in the lowest fishes we find that the sac assumes a ring-form (Fig. 4) by reason of the formation of a semicircular canal with a pear-shaped widening or ampulla at either end. In these the nerve terminates in hair-cells without otoliths, while between these a larger portion of the sac receives the main nerve-supply at a prominent "macula" supplied with hair-cells and otoliths. A second and a third semicircular canal, each with its own ampulla and nerve, is found in the higher forms, and the main sac divides into two increasingly separate portions with separate nerve-supply. One of these portions communicates with the semicircular canals, while the other is connected with a tubular outgrowth, which in the highest forms coils into a spiral and is encased in a snail-shell covering, which gives it the name of "cochlea." The nerve passing to this becomes highly developed and the end-organ is greatly elaborated into an apparatus generally called after its discoverer, "Corti's organ." Around this essential apparatus more and more complex protective envelopes and spaces filled with "perilymph" have been developed, while accessory apparatus, called middle and external ear, have been formed to aid in the conduction of sound-waves to the percipient contents of the labyrinth.

The development thus roughly traced in the ascending scale of animals can be still more perfectly seen in the development from the ovum of the embryo of the higher forms. Here we see a portion of the external surface dip inward as a pit, become separated as a closed sac beneath the surface, undergo the elaboration described, secure nerve-connection with the brain and at such points of communication develop its hair-cells and otoliths. Originally a spherical sac, its complexity soon merits its name of labyrinth and this membranous laby-

EAR

rinth gives form to a surrounding labyrinth of cartilage or bone, which has been longer known and studied.

Taking the human ear as representing that of all the higher vertebrates and as an elaboration of that of lower animals, we find an acoustic nerve emerging from each side of the pons or lower back part of the brain, to pass, in close association with the nerve giving motion to the face, into the stony-hard, innermost part of the temporal bone which encloses the ear, but may be paralyzed by involvement in tympanic disease. The facial nerve passes on through, and practically has but accidental relation to the ear. The acoustic nerve, containing nerves for the organ of equilibrium, divides and

FIG. 3.—1. Otolith; 2. Hair-cells; 3. Nerve-trunk.

is distributed to the various parts of the labyrinth. At each point of its distribution cells with hair-like projections form end-organs through which impressions are received to be conveyed to the brain. Three of these points are in the three pear-shaped swellings of the semicircular canals, two are in the two vestibular sacs and the most elaborate enters the base of the snail-shell (Fig. 8), and is distributed to the highly elaborated organ of Corti, here located. This consists of a fairly orderly arrangement of hair-cells without otoliths, supported by curiously modified cells of like origin (Fig. 7), all resting upon a delicate "basilar membrane" narrowest below and broadest above, which winds spirally from the bottom to the top of the shell-like cochlea, and is formed of parallel transversely stretched fibres. Here we have an apparatus comparable to the strings of a harp or piano; and just as each string of a musical instrument can vibrate in accord with those attuned to it in another and can even repeat the tones of an inaudibly distant instrument with which it is connected by a wire; so there is much to support Helmholtz's claim that each fibre of the basilar membrane is a cord tuned to a certain pitch and vibrating responsive to any tone of that exact pitch which reaches it. This serves to excite a special hair-cell resting upon it and send a nerve-impulse along the ultimate nerve-fibril of which this forms the terminus. Cer-

tainly the apparatus in form and elaboration meets most of the requirements of such a theory and its partial destruction by disease has caused loss of hearing for certain tones—low if the apex, high if the base, be injured.

Outside of the labyrinth or *percipient* apparatus we find a *conducting* apparatus of external and middle ear (Fig. 9). The outer ear is formed by the in-growth of a pit of the skin-surface to constitute an external auditory canal, around the edge of which gristly projections raise the skin-covering into the prominent but unimportant features to which the name "ears" is commonly applied. The inward growth of the canal brings its bottom into close relation with the middle ear, so that only a thin partition, the drumhead, intervenes. The middle-ear is an outward development of the mouth-cavity, which hollows out the tissues between the external and internal ears—forming the Eustachian tube as its inner portion, the drum-cavity or tympanum just within the drumhead at the bottom of the external canal, and other air-spaces, "mastoid cells," of less constant presence and form and of doubtful value, but notable because of serious disease-conditions to which they are subject. Two "windows" make communication between the internal and middle ear, both closed by membranes shutting in the fluids of the labyrinth—that closing the lower "round window" being called the secondary tympanic-membrane. The upper or "oval window" is occupied by the foot-plate of the stirrup-bone, which with the little hammer and anvil forms (Fig. 11) a compound lever between the drumhead and the labyrinth-fluids. This serves to increase the force while lessening the amplitude of the vibrations of the drumhead and thus aids the transmission of waves of sound, especially of low tones, from the air to the internal fluids. The lower animals move the external ears as an aid in locating sounds, but the muscles effecting this are rudimentary in man and the external ear can be lost with little recognizable impairment of hearing. More important, although of ill-determined working, are the muscles moving the little bones of the drum-cavity; one, the drumhead tensor, drawing in the hammer-handle and thus tightening

FIG. 4.—1. Acoustic nerve and macula in vestibular sac which communicates with (2) the anterior and (3) posterior ampulla of (4) the semicircular canal.

the drum-membrane to which it is attached, and one acting on the stirrup. Even the drumhead and chain of little ear-bones can be actually or virtually destroyed with preservation of a large part of the hearing: but their presence in damaged condition may be a serious obstacle to useful function by impeding sound conduction.

The upper and lower limits of human hearing are somewhat in dispute, but it is fairly safe to say that tones of 32 double vibrations per second and up through 10 octaves, should be audible to a healthy ear. If a cog-wheel touching a card or other elastic plate be turned with increasing speed the individual strokes or vibrations can be distinguished up to 16 per second;

FIG. 5.—Developing labyrinth dividing into two sacs with separate areas of hair-cells.

then they blend and a continuous tone is produced; but the tone heard may be an overtone and not that of 16 per second as is often claimed. Through the thin young drumhead or one having an opening in it still higher tones can be heard, probably up to 55,000 vibrations; but age and disease easily effect changes which bar out these high and relatively weak tones; yet it is striking to note how well they may be heard by those deaf to ordinary speech. Those unable to enter general conversation by reason of impairment of the conducting apparatus may often hear the same voice readily over the telephone, which transposes it to a higher key; and some much-advertised hearing-helps have their value as portable telephone lines. Human speech, the hearing of which is in civilized life the most important use of the ear, has a range from near the lowest limit of perception in the sound of R to some 4,000 vibrations per second in the sibilants S and X. We have in speech, therefore, with its easy gradations of intensity from faint whispers to loud shouts, a ready means of testing the hearing and mea-

suring its defects. Variable as are voices or even the same voice within its range, it constitutes our best practical test of the degree of deafness. Generally the faintest articulate whisper should be heard at arm's length and a loud "stage whisper" 50 feet or more. The numbers up to 100 make good tests if rightly selected and should be spoken clearly with the "reserve-air" which can be expelled from the lungs after an ordinary "tidal expiration"; and they should be repeated by the person examined in evidence that they have been correctly heard. The watch is a very variable, limited, and imperfect test, which may be ill-heard by ears otherwise perfect, well-heard by some with little useful hearing and imagined or falsely claimed to be audible when it is not, in a way not always easy of detection. All measurements of hearing for sounds or speech should be made with the eyes screened from seeing the approach of a sounding body or "reading the lips" as many deaf persons do most successfully, at times unconsciously. Medically, the best tests of hearing are by speech and by tuning-forks—the latter serving not only to measure the hearing or loss of it, but to locate the seat of trouble as a prime requisite to successful effort for recovery. A "continuous tone-series" of tuning-forks or other instruments may be used by the expert to test the entire ten or more octaves; and the aurist should always have several forks, although much may be learned with a single one. A fork of 200 to 500 double vibrations per second is the most useful and should be seven or more inches in length and weigh as many ounces: the latter is important as the loudness and duration of tone depend upon it. One of 30 to 50, and one of 2,000 double vibrations should also be used, while intermediate tones have value. The lower forks should have thickened ends or clamps or pieces of rubber-tubing on the tips

FIG. 6.—Diagram of the cochlea in section with the channels for its nerves and the perilymph spaces which surround the cochlear canal in its windings.

to damp the "over-tones," which may be heard by ears to which the fundamental note is inaudible. The fork should be struck by falling of its own weight through its own height upon a rather dead surface such as the top of the knee, and will thus give a tone of fairly constant strength; and testing a number of normal ears will show for each fork at what distance

EAR

or for how many seconds it should be heard after a standard blow. Thus if a fork which a normal ear hears at 15 inches or for 100 seconds is heard by a deaf ear only 5 inches or for 30 seconds, $5/15$ or $30/100$ fairly represents the fraction of hearing remaining. Ears with impairment of the percipient apparatus of the internal-ear hear high sounds relatively less as a rule; those with the more usual conduction-defect hear low tones worse. A case of "nerve-deafness" may hear no sound from the 2,000 fork—a case of tympanic catarrh none from the 50 fork; although all other tones are fairly or even perfectly heard. A whistle de-

paratus sounds produced or conducted within the head. The deafer ear may hear the sound by bone-conduction better than its fellow. More than this—it can often hear better than a normal ear, perceiving through the bone for 50 seconds, perhaps, the vibrations which ought to be heard for only 45. With this generally goes a marked loss of hearing through the air, which may be reduced from 100 seconds to 40, 20, or less. Under such conditions bone-conduction will be better than air-conduction and the sound will be louder as well as longer when resting on the head. This constitutes Rinne's or Schwabach's test and is simplified by resting the handle of the lightly vibrating fork back of the ear and then placing it outside the opening with the question "louder back or front, front or back?" The perception through the bone, especially at the bridge of the nose, ought to be nearly the same in duration as the *feeling* of the vibrations by the examiner's fingers; and Gardiner Brown saved time and confusion by noting how many seconds before or after his fingers lost the vibration, it ceased to be heard in the ear. Bone-conduction may greatly preponderate, in evidence of the conductive defect in an ear with marked loss of air-conduction, and yet this test or Schwabach's timing will show that the percipient apparatus is also defective and loses the sound sooner than normal, instead of having it exaggerated. So we must test the actual, as well as the relative, perception through the bone.

Another delicate and important test may be here mentioned. The drum-cavity communicates with the throat back of the nose by a trumpet-shaped tube called after its describer Eustachius. This serves as a drain for the removal of any mucus from the drum-cavity and as a ventilating passage for maintaining equal air-pressure on each side of the drumhead. It is really a slit habitually closed, but opens in the act of swallowing or yawning, from the action of the muscles lifting the palate. If a sounding tuning-fork, then, is held before the

FIG. 7.—Scheme of human cochlear canal in section showing Cortis organ and its nerve connections.

vised by Galton giving tones from 4,000 up to 40,000 double vibrations is a practical and useful aid in studying the upper limits of hearing, as are the steel rods suspended by threads introduced by Koenig, since tuning-forks of such a pitch are unusual and costly. All of these tests should be made at the side of the head, but not so near that they may be *felt* instead of heard. The other ear may need to be closed with a down cushion or other adequate cover and we must avoid several "deaf-spots" nearly opposite the opening of the canal where the sound-waves by interference are weakened or lost.

Thus far we have considered tests of the hearing for sounds coming through the air in the usual way; but if the handle of a vibrating tuning-fork or other sounding instrument be rested upon the head it will be heard through the bone, and the sound will generally be much louder if the fingers are stuck into the ears. If only one ear be stopped, it will be heard louder in this ear—so much so that the other generally fails to recognize its vibration, even though the fork is resting close behind or above it. Normally this "bone-conduction" is only half as loud as "air-conduction"—the fork which should be heard for 100 seconds through the air in front of the ear is heard but 45 when resting behind it. It can usually be heard from the bridge of the nose or the teeth after it has become inaudible back of the ear; but when unheard here it should be audible for a further period if held close outside of the canal-opening. Yet disease-conditions can affect the matter like stuffing the fingers in the ears; the obstructions in the conducting apparatus which bar out in greater or less degree the outside air-vibrations shut in and echo back upon the percipient ap-

FIG. 8.—Cut through the cochlea, showing its nerve (4) passing to the turns (2,7) of the cochlear canal, above which are those of the vestibular scala. (5) and below the tympanic (6); the facial nerve. (3) is seen in close relation to the auditory.

nostrils as the patient swallows there should be a brief opening of these tubes permitting freer passage of the sound to the ear. We thus determine the normal action or its lack

in these very essential parts of the apparatus.

This proper ventilation of the drum-cavity is needful for perfect function. It is said that the head of the military drum will split if there is no opening in the side; and certainly a stuffed Eustachian tube makes all concussions painful if not damaging to the drum-membrane. Any excess of pressure within interferes with the freedom of the windows, while any lack of air makes pressure on the outside preponderant, forcing in the drumhead and through the chain of bones pressing upon the labyrinth. More than this, if the partial vacuum in the drum-cavity is increased through absorption of the unrenewed air by the moist lining, the drumhead becomes stretched until it collapses into contact with the inner wall, or the walls congest and swell to fill the space or else fluid is poured out to occupy the cavity. Generally all of these results are present in varying degree and from this comes the large majority of ear-diseases. So, too, interference with the freedom of the breathing through the nose unfavorably affects the ears. If one holds the nose and blows, air will be forced up the tubes into the drum-cavities, and swallowing motions have to be made

his patient that only the recent losses can probably be recovered, and that ill-health or recurrent cold-takings may offset his best efforts. Yet many of these cases tend to grow steadily worse unless judiciously treated and a gain, however slight, is better than a loss. Mere inflation of air up the Eustachian tube by the Politzer bag or the catheter can aid the earlier stages; but in chronic conditions intratympanic medication must be used to stimulate the lining of the drum-cavity and retrace the steps by which it has become thickened and stiffened.

Accompanying the defect of hearing for outside sounds there may be greatly increased hearing of noises within the head. Every one hears a singing in the ear when a shell or other resonator is held against it, and similar results often follow any thickening and stiffening of the conducting apparatus. Tinnitus, as the subjective sound is called, may be due to many causes, however, and its relief is often difficult. Generally a perception of the sounds of the blood-circulation, it may be caused by changes in the blood itself in anæmia, by overaction of the heart, by brain-pressure due occasionally to stuffiness of the upper nasal passages, as well as to more local affections. It is usually worse when lying down and in a silent place, since outside noises and occupations of mind and body make it less noticeable; but it is in some cases unceasing and intrusive, seeming to bar out other hearing, and may be almost maddening. In its milder forms it is annoying and excites apprehension of deafness or of brain-disease, with which it is known to be sometimes associated; but its many causes, often wholly trivial, must be remembered and rational measures employed for its relief. As stuffing of the Eustachian tubes or tension of the drumhead and chain of bones are its common causes, much relief can often be gained by simple hot gargling to

FIG. 9.—Section through external ear with its pinna (1) and (4) canal and the middle ear with its drumhead (7) and Eustachian tube (10), showing the labyrinth with its cochlea (12) and semicircular canals.

to relieve the distention. If this swallowing is done while the nose is held closed, strong suction is exercised, making partial vacuum in the drum-cavity, and this occurs when cold-taking stuffs up the nose or tonsillar enlargement narrows the upper throat just behind it. It is not surprising then, to find that two thirds of ear-patients have middle-ear trouble, only one fourth external-ear affections and in hardly one tenth is the perceptive nervous apparatus at fault. This explains why much of the treatment of ear-diseases must be directed to or through the nose and throat in the effort to restore free ventilation and repair the injury due to the lack of it. The unfavorable influences are often slow and insidious in action; deafness may be advanced in one ear without attracting the notice which any defect of the second ear quickly forces upon the attention; and treatment must be long-continued if it is to retrace much of the course by which the affection has passed to its later stages. Discouragements are frequent, and the conscientious aurist has to tell

FIG. 10.—Developing ear with cartilage in the partition between external and middle ear, which are beginning to form.

free the former, or gentle massage of the drum-structures, as may be well done with the hands.

A curious characteristic of conduction-defects is the ability to *hear better in a noise*, often better than normal ears. A person deaf to ordinary speech in a quiet place will hear on a train much that is inaudible to persons nearer the speaker. One with nerve-deafness will be un-

duly disturbed by other noises, although perhaps unconscious of defect in a still place.

Only less important than freedom of the Eustachian tube is a healthy free condition of the external canal. This is lined with skin and supplied with glands like the sweat-glands elsewhere, but furnishing the ear-wax or cerumen which consists of the dead skin-scales and oily material. The purpose of this seems to be to arrest by its stickiness the entrance of dust, small insects, etc., from outside; but it serves a more useful purpose in cleansing the ear. The growth of new skin is most active at the centre of the drumhead and is there rapid enough to spread out over the membrane, moving the older cells before it by a glacier-progress which carries them beyond the margin and out upon the

FIG. 11.—Inner surface of drumhead (9), to which is attached the handle (7) of the hammer, the head (5) of which is hinged to the anvil (4), the long arm (6) of which connects with the stirrup (10) the chain pivots on the horizontal arm (3) of the anvil and conveys vibrations to the labyrinth.

walls of the canal before they become effete enough to be thrown off. Hence the normal drumhead is self-cleansing and needs no officious aid. The loosening scales of dead skin pass out along the walls of the canal and about its middle become a pasty mixture with the secretion of the cerumen-glands. This clings to the fine hairs of the canal, but is gradually worked outward by the motions of the jaw-joint, which presses upon the canal, and drying into unnoticed scales it escapes from the exit. Under diseased conditions, including those of the throat and middle-ear, the wax tends to diminish in quantity and grow harder, escaping less readily or collecting in firm plugs. So long as any crack remains for the sound-waves to pass between it and the wall, hearing may be unaffected by an almost total filling of the canal; but jarring may force it down upon the drumhead and moisture may swell it into complete closure. Marked and sudden deafness results, often with dizziness, tinnitus or coughing. The plug may dry or crack away from the wall, quickly relieving the trouble, but only for the time; and it becomes so

moulded to the irregular curves of the canal as to make it difficult to remove. Most of the sponges and spoons offered in the drug-stores are good only for ramming in the wax more firmly and pressing it down upon the drumhead. They should never be used. The best solvent for ear-wax is hot water, and it should be syringed in with gentle force until the last particle of the plug has been removed. Dropping in of oil or other fluids rarely does much to loosen the collection, they can often increase the distress caused by its presence—they certainly cannot remove it, although some hope that they will do so seems present to many that use them. Any violence in digging out the plug or too vigorously working even with the syringe is to be condemned. Underneath it skin-flakes have been forming which are often partly incorporated in its mass, partly still fast to the walls—ready like “hang-nails” to tear down into the quick and leave open wounds, very easy of infection. One seventh of the work of the aural surgeon consists in removing ear-wax, rather especially for those of his private patients who seek to be too clean. It is easy to do it skilfully and promptly, yet it is often not so removed. If spoon-like instruments be used at all they should be sharp—they will thus be more efficient, while no mistaken idea of harmlessness will make them doubly dangerous. There is many a thing besides a firearm that a man “did not know it was loaded.”

Seeds, beads and other foreign bodies are sometimes put into the ears. If they are let alone they may remain for many years without doing the least harm; but forcible removal has often done great or fatal injury. If the ear is directed downward they will often fall out, especially with a little rotary rubbing in front of the ear. The syringe will almost invariably bring them away promptly and safely. If they have been rammed in and fixed, it is really gentler to remove them by laying forward the soft parts under ether and operating in the bony canal.

Two other affections of the external ear make up much of the 25 per cent of disease involving this part—the diffused and the circumscribed inflammations of the canal. The first may be broadly called eczema—the latter furuncle or boil. Gout and many general conditions can predispose to the eczematous inflammation, which by its heat and moisture makes the ear a hot-bed for the growth of the moulds and bacteria which maintain or increase the trouble, and it may have an intensity verging into erysipelas. The milder, chronic forms are generally responsible for furuncles, for they furnish the itching which leads to scratching and the germs which punish this. “What did you scratch it with?” will generally bring confession of a hairpin or a match-stick according to the sex, and boils are more common on the right-hand side. The suffering caused by a boil may be extreme; sometimes keeping the patient walking the floor all night. They are rarely serious matters, but each tends to cause others, so they cannot be made light of. They consist of an infective inflammation of the glands of the skin lining the canal and are apt to be trivial when the superficial sebaceous glands are involved, but more severe if a deeper cerumen-gland is

EAR

the seat. These glands extend into the subcutaneous tissue, possibly into the periosteum, so their inflammation can excite a periostitis pressing the ear out of place and perhaps strongly suggesting mastoid inflammation. Pressure or motion of the parts, as in chewing, is acutely painful; but firm pressure on the bone can be comfortably borne if all motion of the canal be avoided. Hot douching (110° F.) is usually comforting and if fully used has an excellent tonic effect; warmth and moisture often increase and renew the trouble. The infection should be fought by mercurial oxide ointment and, if bearable, a firm plug covered with it should be passed into the swollen canal where it will exercise pressure, secure a useful massage from each jaw-motion and continue throughout the day the rubbing in of the salve.

Bony outgrowths of the walls sometimes narrow or close the external canal and less often cancerous growths involve it and the external ear. The bony growths are curiously common in the ears of ancient Peruvian and Mound-builders' skulls and in modern times in Hawaii and in England. The London surgeons among their private patients see and remove more of these bony outgrowths than are reported from all the hospitals of the world. Their causes are not clear, and bathing has been suggested as influencing their formation. As seen in other than Englishmen, the great majority seem due to long-continued discharge from the ear; and this suppuration must be cured or the growth removed, lest the confinement of pus may lead to serious or fatal complications.

The suppurative inflammations of the middle-ear form the most important phase of our subject, not only because of their malign effect in producing deafness and deaf-mutism, but from their serious menace to the life. Thousands are known to die annually from ear-diseases, and the records of large numbers of post-mortem examinations show that a larger proportion usually escape recognition during life. The prevalence of influenza for ten years past has hugely increased the frequency of serious outcomes, as well as served to bring them to notice; but even before that the record was long and grim. All the eruptive fevers, especially scarlatina, measles and typhoid, are apt to bring involvement of the ears. These should, therefore, be closely watched and generally guarded in some measure by coverings, especially in children, who may never call attention to their ears and yet if they lose hearing are prone to become deaf-mutes.

It is well known that discharge from the ear is apt to lessen or cease at the onset of serious extension and that bottling up of the flow may give rise to such results; but the somewhat prevalent view that such suppuration should be "let alone and it will be outgrown" is as mistaken as is the idea that it is dangerous to bring it to an end. To "stop it up" is wholly different from stopping it by cure: and the chronic cases of slight discharge, often hardly noticeable, are those from which fatal diseases such as brain-abscess, pyæmia, and sinus-clotting are generally recruited. Few good insurance companies will have anything to do with a man having a long-standing running ear—the risk for the individual may not be very noticeable, but it is

enough in any large aggregate to consume all the profit of insuring lives.

Suppuration of the middle-ear is ushered in by pain, and the severity of this "ear-ache" is at times some measure of the seriousness of the attack. The onset may be insidious or misleading, however, and relief may be sought of the dentist; while in children the fever, delirium or convulsions may draw attention away from the ears. Stains upon the pillow or visible moisture in the canal may be the first indications that the ears are involved. But every such case, however stormy or mild its beginning, may go on immediately or remotely to the worst of issues; and it is our duty to take reasonable precautions from the start, lest we have reason later to reproach ourselves. Mere external protection as by ear-tabs or a night-cap may conserve the recuperative powers; gentle hot douching with clean water may relieve the pain by reducing the inflammatory congestion; and spray and gargling may strike at the root of the trouble in nose and throat. However ill the patient may be in other respects it is mistaken kindness to withhold these simple yet often effective measures of treatment. The tendency is to a "gathering in the ear," which may be watery or mucous or may be purulent and infective. If the simple measures named, with dry heat from a salt-bag or hot water-bottle fail, there is need for surgical aid. Drainage by the natural Eustachian channel can only sometimes be gained; but after good cleansing of the nose and upper throat, it should be gently attempted by the Politzer method or the catheter. Abuse of these means is rightly condemned; so only the expert can maintain his right to use them if ill results follow—in spite rather than because of them. If they fail and the drumhead is seen to be bulging, especially with yellowish fluid, it should be delicately cut along its back margin to furnish a free escape for the collected fluid. If the swelling is marked at its upper portion, the knife should be carried up into this region, coming out in a sweep to the bone along the upper back wall. Free bleeding may be encouraged by warm douching, and is more effective from such a cut than from external leeching; yet since much of the blood-exit from the drum-cavity is along the front wall of the canal, leeching in front of the ear may be almost as good, but should remove not less than four to eight ounces. A wick of gauze or absorbent cotton, dry or moistened with carbolic or boric glycerine, should be inserted deep into the canal and the protective covering replaced. "But if you cut the drumhead you destroy the hearing!" is a fallacy which is still repeated. The opening of the drumhead is a delicate operation, often very painful so as to require ether or other anæsthesia and capable of doing injury to the structures beyond it; but it only forestalls the opening which would occur spontaneously, makes a free and well-placed opening and really saves the drumhead from ulcerating through. Far more important is its influence for good in relieving the injurious pressure in the drum-cavity and it may be really life-saving in preventing fatal extension of the suppuration.

It is impossible to foresee how mild or serious any case is going to prove; and without panicky fighting of shadows, it is only reasonable to

press home all due precautions. The patient is best in bed, especially if feverish, and all exposure and stimulating diet avoided. Constipation must be relieved, for straining of every sort is not only painful but increases the congestion.

With the opening, artificial or spontaneous, of the drum-membrane, there is generally relief of the pain; yet this is almost sure to recur, especially at night, but with lessening severity, duration and frequency. The fever, which is commonly marked in children, declines and some of the lost sleep is made up. The tension within the drum-cavity is lessened by the escape of the "gathering" and obtains continued relief by the persistence of the discharge. This is thin and bloody at first, then thicker and probably stringy. Its amount is often surprising, so that hourly cleansing is needful, and it may excoriate the skin in and about the canal, calling for protective ointments. The ideal treatment is thoroughly to cleanse before cutting the drumhead and thereafter as frequently as the flow demands to change the sterile wicks of cotton in the canal. If these are prepared by the hundred, each wrapped in a waxed paper and the package of them baked, the patient can readily remove the moist plug and substitute a clean one without contaminating it. Practically, frequent syringing with boiled water at 110° F. or more and a clean soft-rubber bulb better relieves the pain and cleanses the deeper parts of the canal. The heat can penetrate where the water cannot and is the best astringent and stimulant. After two or three weeks the discharge should cease, and another week or two should bring cure; but the cardinal fact in these cases is the infected character of the inflammation, which endangers serious destruction in the drum-cavity and adjacent more vital regions. Often worse than the destruction is the scarring which results from nature's effort at repair. An opening in the drumhead generally heals and may leave no visible scar; in an important minority of cases the edges are skinned over, preventing its closure and grafting skin upon the mucous surfaces within. Nature is prepared to sweep away fluid waste material in the drum-cavity, but skin-flakes forming there are difficult of removal; they tend to collect and by their presence excite more exaggerated scaling. Onion-like masses may thus form, constituting "cholesteatoma" or pearly tumor, and these can do much damage by their pressure as well as maintain or renew the suppuration. The bony walls and the little ear-bones may be destroyed by pressure or decay; and while an exit may thus be made for the cholesteatoma-mass, it too often works inward instead of outward, damaging the labyrinth and may carry the infective process into the brain-case. Just under the thin floor of the drum-cavity is the head of the jugular vein, its intracranial part is equally vulnerable just behind, and an even thinner roof alone protects the brain-membranes above. It is not surprising, then, that symptoms of brain-inflammation are not unusual in ear-diseases; and while these may be merely irritative and transitory, they are at times of deadly meaning. Where the bone suppurates and decays the mastoid-projection just behind the ear is apt to be involved, forming a "mastoid abscess," and may need to be chiseled open to

give exit to the matter and dead bone. Even without this, the inner wall of bone can decay and an abscess-collection form on the outer surface of the brain-membrane. Yet this is strong and firm and may thicken to better protect all within; so such "extra-dural abscesses" have but a fraction of the danger of a collection upon or in the brain itself. Even this can now be often recognized in time by its subnormal pulse and temperature, and located sufficiently by its symptoms to permit of surgical relief; and nearly 80 per cent of the reported operations have been followed by cure. The infection can penetrate the adjacent great blood-vessels and cause clotting within them, with general blood-poisoning and formation of abscesses in the lungs or other parts of the body; but the septic clot can be recognized and safely removed in many cases even when extending down almost to the heart.

Disease of the nervous apparatus of the internal ear is met in hardly 10 per cent of ear-patients. Some of these are due to injury and fracture at the base of the skull, others to cerebro-spinal meningitis or other severe fevers, more still to the extension inward of the catarrhal or the suppurative middle-ear inflammations. Mumps, too, or diphtheria may be followed by sudden total deafness. Inherited syphilis is one of the insidious and slowly acting causes, generally also giving rise to clouding of the cornea of the eye and marked by typical malformation of the second teeth. In any of these conditions the main hope of relief is through the absorption by mercury and iodine of the exuded material, which in the meningitis cases may be in the brain itself and not in the labyrinth. Of notable interest are the cases of "boiler-makers' deafness," as we sometimes call a group of occupation-disorders, usually located in the internal ear, and affecting those subject to persistent clangor—a condition which may compel change of work, if freeing the Eustachian tubes and good plugging of the external canals fails to relieve the advance of deafness. Important too are the cases of vertigo, due to ear-disease. Menière called attention to some of these as caused by labyrinthine apoplexy and they are often called by his name; but the recognizable disease may be of different nature and often is located in the drum-cavity, indirectly affecting the organ of equilibrium in the semicircular canals. Influenza has caused a number of these cases in which the hearing for more or less of the scale has been suddenly lost and the patient made incapable for days or weeks of lifting the head from the pillow. Absorption is here also the best hope; but in some extreme cases advantage has been taken of the damaging effect upon the ear of large doses of quinia, and the irritative condition has been by it changed to a destruction with cessation of the vertigo.

Finally we may mention the brain-affections in which the hearing-centres, especially that for speech, are involved, when we may have "word-deafness," which prevents recognition of the spoken word, although the hearing is perfect for tones of every pitch; for while the ear itself is uninvolved, it is only through ear-examination that one can by exclusion reach a correct diag-

nosis and perhaps point the way for the surgical removal of a brain-tumor. 6

B. ALEX. RANDALL, M.A., M.D.

Ear Cockle, a disease peculiar to wheat caused by the presence in the grain of worms belonging to the family *Vibria*. In some parts of Europe the disease is known as purples.

Ear-ring, a ring or other ornament for the ear, a hook passing through the lobe, with a pendant of diamonds, pearls, or other jewels, frequently attached. It seems to be in repute among all nations, the most savage as well as the most civilized, and it dates from the most remote antiquity. In Gen. xxiv. 22 we read that Abraham's servant presented Rebekah with an ear-ring, and the same ornament is mentioned in several other passages of Scripture. In the statue of Aphrodite by Praxiteles the goddess was represented with rings in her ears. Among the fine specimens of antique art now extant there are several heads bearing only a single ear-ring on the left ear; and it appears that the Greek children only wore them on the right ear. Ear-rings were not so commonly worn by men as by women, yet, that men did sometimes do so is evident from the fact that the Emperor Alexander Severus thought it necessary to interdict this ornament to men. The ear-rings worn by the ancients sometimes consisted of simple rings, but pendants were frequently attached to them, and these sometimes very heavy. The form of the pendants was various. The Roman ladies used ear-rings of great value. European women, as well as some of the men, wear ear-rings at the present day, although the custom has become almost obsolete in the United States and children's ears are no longer pierced as formerly.

Ear-shell, **Sea-ear**, **Oreille de Mer**, names for European species of *Haliotis*. See **ABALONE**.

Ear-trumpet, an instrument used by persons partially deaf to strengthen the sensation of sound. The purpose of the external ear, both in men and beasts, is to collect, by its funnel form, the waves of sound, and conduct them to the internal organs, the seat of the sense of hearing. All the artificial instruments, then, ought to resemble in form the natural ear. They are sometimes made like a trumpet of moderate size, the smaller aperture enters the ear, and the wider is directed to the quarter from which the sound proceeds. But these instruments are inconvenient, both on account of their size and the necessity of continually holding to the ear. Ear-

cornets (so called from the French, *cornet acoustique*) are applied to the outside of the ear, and kept in their place by a slender steel spring. A small instrument in the form of a scroll, called an auricle is worn inside the ear, the mouth only being visible. Flexible india-rubber tubes, kept open by a spiral wire spring, are among the most convenient forms of ear-trumpet.

Ear-worm. See **CORN INSECT-PESTS**.

Ear of Dionysius, a famous cavern near Neapolis, in which the slightest whisper was audible at a great distance. It was connected by a secret passage to the palace of Dionysius, the Elder, of Syracuse, who died 367 B.C., also an acoustic instrument with a large mouthpiece to collect the sound, which a flexible tube conducts to the ear of the person.

Eard'ley-wil'mot, **Sydney Marrow**, English rear admiral: b. East Sheen, Surrey, 3 Oct. 1847. He entered the navy in 1861, retiring in 1893. He has published 'Life of Vice Admiral Lord Lyons'; 'Our Navy for a Thousand Years'; 'Our Fleet To-day and its Development during the Last Half Century'; 'Our Flags: Their Origin, Use and Traditions.'

Earl, **Robert**, American jurist: b. Herkimer, N. Y., 10 Sept. 1824; d. there 2 Dec. 1902. He was graduated from Union College 1845, and was admitted to the bar 1848. Elected county judge in 1855 he served two terms and in 1869 was elected to the court of appeals, retiring in 1894. He founded the Herkimer Free Library in his native town.

Earl, a degree of the British nobility between marquis and viscount. The title was made hereditary by William the Conqueror, and for a time was used interchangeably with that of count, the corresponding title on the Continent. The wife of an earl is still called a countess. An earl's coronet is composed of eight pearls raised upon points, with small leaves between, above the rim. Though not of the highest rank earl is the title of highest antiquity in Great Britain. See **HERALDRY**.

Earl Marshal, the eighth great officer of state in Great Britain, who had, anciently, several courts under his jurisdiction, as the court of chivalry and the court of honor. He is the head of the College of Arms (Herald's College), grants armorial bearings, and determines all claims in connection with them. The office is hereditary in the family of the Howards.

Earle, **èrl**, **Alice Morse**, American writer: b. Worcester, Mass., 27 April 1853. She was married to Henry Earle in 1874. She has written extensively upon the manners and customs of the colonial period in New England and New York. Her published works are: 'The Sabbath in Puritan New England' (1891); 'Customs and Fashions in Old New England' (1893); 'Life of Margaret Winthrop' (1894); 'Diary of a Boston School Girl' (1894); 'Costumes of Colonial Times' (1895); 'Colonial Dames and Goodwives' (1895); 'Old Narragansett' (1896); 'Curious Punishments of Bygone Days' (1897); 'Colonial Days in Old New York' (1897); 'Home Life in Colonial Days' (1898); 'Child Life in Colonial Days' (1899); 'Stage Coach and Tavern Days' (1900); 'Old Time

EARLE — EARLY

Gardens; Sundials and Roses of Yesterday' (1903).

Earle, Ferdinand Pinney, American soldier: b. Hartford, Conn., 11 Sept. 1839; d. 2 Jan. 1903. He served as a private soldier in the Federal army during the Civil War. In 1889 he was appointed on the staff of Gov. Hill of New York to represent the artillery branch of the State service with the rank of brigadier-general. In 1884 he was decorated by the Venezuelan government with the Order of the Bust of the Liberator as a recognition of services rendered that country.

Earle, John, English ecclesiastic: b. York, England, 1601; d. Oxford 17 Nov. 1665. He was educated at Oxford and after graduation became tutor to Prince Charles and accompanied him in his exile. After the Restoration he was advanced in succession to the offices of dean of Westminster, bishop of Worcester, and bishop of Salisbury. He was the author of several works, the best known being 'Microcosmographie,' one of the "character" books popular in the 17th century.

Earle, John, English philologist: b. Elston, England, 29 Jan. 1824. He was educated at the Plymouth New Grammar School and at Kingsbridge Grammar School in early life, entering Oxford in 1842. He took his B. A. degree in 1845 and was elected fellow of Oriel. Taking the degree of M. A. in 1849, he became professor of Anglo-Saxon, being later ordained deacon. He was presented by Oriel to the rectory of Swanswick 1857; appointed to the prebend of Wanstrow 1871, and became professor of Anglo-Saxon in the University of Oxford 1876. His chief publications are 'Gloucester Fragments' (1861); 'A Book for the Beginner in Anglo-Saxon' (1877); 'English Plant Names from the Tenth to the Fifteenth Century' (1880); 'Anglo-Saxon Literature' (1884); 'English Prose: its Elements, History and Usage' (1890); 'The Psalter of 1539: a Landmark in English Literature' (1894); 'A Simple Grammar of English Now in Use' (1897).

Earle, Mary Tracy, American fiction writer: b. near Cobden, Ill., 21 Oct. 1864. She was educated at the University of Illinois and since 1893 has devoted herself to literary pursuits. She is the author of 'Through Old-Rose Glasses and Other Stories' (1900); 'The Man Who Worked for Collister'; 'The Wonderful Wheel'; 'The Flag on the Hill Top' (1902).

Earle, Mortimer Lamson, American classical scholar: b. New York 14 Oct. 1864. He was educated at Columbia College, receiving his A. B. degree in 1886. He was instructor in Greek at Barnard College for six years beginning 1889, and was then appointed associate professor of Greek and Latin in Bryn Mawr College; 1898 to 1900 was lecturer in Greek at Columbia; and in 1900 was appointed professor of classical philology in Barnard College. Among other literary work he has edited Euripides' 'Alcestis' (1895), and Sophocles' 'Edipus Tyrannus' (1900).

Earle, Parker, American horticulturist: b. Mount Holly, Vt., 8 Aug. 1831. He took up his residence for some years in Illinois and became a trustee of the State University; thence he removed to Mississippi. At the

World's Exposition at New Orleans, in 1884, he superintended the horticultural department, and since 1885 has been president of the American Horticultural Society.

Earle, Pliny, American inventor: b. Leicester, Mass., 17 Dec. 1762; d. there 19 Nov. 1832. In 1785 he became engaged in the manufacture by hand of machine and hand cards for carding cotton and wool, and invented in 1790 a machine for the manufacture of such cards by which the labor of one man for 15 hours could be performed in as few minutes.

Earle, Pliny, son of the preceding, American physician: b. Leicester, Mass., 31 Dec. 1800; d. Northampton, Mass., 18 May 1892. He was educated at the Friends' School, Providence, R. I., and was graduated as M.D. at the University of Pennsylvania in 1837. He was resident physician of the Asylum for the Insane at Frankford, near Philadelphia, 1840-2; physician to Bloomingdale Asylum N. Y., 1844-9; elected professor of materia medica and psychology in the Berkshire Medical Institution at Pittsfield, Mass., in 1863, and was superintendent of the Massachusetts State Hospital for the Insane 1864-1885. In the years 1837-39, 1849 and 1871, he traveled in Europe visiting the most important insane asylums. He is the author of 'Marathon and other Poems' (1841); 'Institutions for the Insane in Prussia, Germany, and Austria' (1853); 'An Examination of the Practice of Blood-letting in Mental Disorders' (1854).

Earlham College, a coeducational institution in Richmond, Ind., founded in 1847, under the auspices of the Order of Friends. In 1902 the school had in attendance 300 students and 21 instructors.

Early, Jubal Anderson, American soldier: b. Franklin County, Va., 3 Nov. 1816; d. Lynchburg, Va., 2 March 1894. He was graduated from the United States military Academy in 1837, fought in the Seminole war (1837-8), and having resigned from the service, entered legal practice at Rocky Mount, Franklin County, Va., in 1838. A member of the Virginia House of Delegates in 1841-2, he was also attorney to the commonwealth in 1842-7 and 1848-52. During the Mexican War he was major (1847-8) of volunteers; and at the outbreak of the Civil War, although strongly opposed to secession, he received the appointment of colonel in the Confederate forces. Promoted brigadier-general for services as a brigade commander in the first Bull Run, he fought with distinction at Williamsburg, the second Bull Run, and Antietam. He was in command of a Confederate division at Gettysburg, and in 1864 of an army for the invasion of Maryland. He crossed the Potomac, defeated Lew Wallace at Monocacy Junction (9 July), threatened an attack on Washington, D. C., but at the arrival of a considerable Union reinforcement, withdrew to the Shenandoah, possession of which he contested with Sheridan, then commanding the Federal army in the valley. On 19 September he was defeated at Opequon Creek, with the loss of 3,000 prisoners and 5 guns, and on 22 September at

EARLY ENGLISH ARCHITECTURE—EARTH

Fisher's Hill, where he lost heavily, and from which point he was driven to the mountains. On 19 October he surprised the Federals in the morning at Cedar Creek, but the tide of victory was turned by Sheridan's arrival from Winchester, and he was completely routed. After his defeat by Custer at Waynesborough (March 1865), he was removed from his command. He attained lieutenant-general's rank. Subsequent to the war he practised law in Virginia, and was, with General Beauregard, a director of the Louisiana lottery. He never took the oath of allegiance. He is ranked high in the list of Confederate officers, and by some authorities was considered not inferior to "Stonewall Jackson." His chief publication is a 'Memoir of the Last Year of the War for Independence in the Confederate States of America' (1867). Consult 'Battles and Leaders of the Civil War,' edited by Johnson and Buell (1887).

Early English Architecture, the name generally given to the first pointed Gothic used in England. This style of architecture began to be used in England about the end of the 12th century, and lasted for about 100 years. It immediately succeeded the Norman, and finally merged in the Decorated style. It is characterized by long lance-shaped windows, which are often gathered into clusters and enclosed by a large arch, the space between which and the tops of the windows is often pierced with circular, trefoil or quatrefoil ornaments. The molding consist of alternate rounds and deeply cut hollows, separated by small fillets. The doorways are often divided into two by a single shaft.

Earth, The. The earth is at once the subject and the object of many sciences. Of these the most elementary are geography and physiography, which deal primarily with the salient surface features of our planet. Next in order of difficulty are geodesy and geology, which deal more minutely with the shape, the size, the constitution, the mechanical properties, and the material history of the earth. The science of meteorology is concerned with the phenomena of the atmosphere; and our theories of the tides and terrestrial magnetism must be added to the list of purely physical sciences of the globe. All of these sciences are intimately related, and they are sometimes grouped under the single term geophysics. In a broad sense, also, these sciences may be regarded as branches of astronomy, for astronomy is founded on, and hence includes, geophysics. This article is written from the point of view of geophysics and deals especially with the physical and mechanical properties of the earth.

THE SHAPE AND THE SIZE OF THE EARTH.

First Approximation.—The form and the dimensions of the earth have presented a problem of the greatest interest and difficulty to men of science for more than twenty centuries, and they promise to tax the resources of the ablest physicists for some centuries to come. The first approximation to a solution of this problem, of which we have definite record, was made by Eratosthenes of the Alexandrian school of astronomers. Assuming the surface of the earth to be spherical, he measured the length and the angular amplitude of an arc of a great circle

extending from Alexandria to Syene. He observed that at Syene, which is about 500 miles south of Alexandria, the sun shone vertically downwards into deep wells at noon on the day of the summer solstice, proving thus that at that place and time the sun was in the zenith. On the same day at Alexandria he observed, by means of the gnomon, that the sun at noon was south of the zenith by one fiftieth of a circle, or 7.2° . The principles involved in these measurements and in the calculation of the size of the earth are very simple, but they are so fundamental as to justify a full explanation. They assume, first, that the earth is spherical in shape; secondly, that the plumb bob at any

FIG. 1.

point of the earth's surface is directed towards the earth's center; and, thirdly, that the sun is so distant that lines drawn to it from different parts of the earth are sensibly parallel. Thus, in Fig. 1, if A and B indicate the relative positions of Alexandria and Syene and C the center of the earth, lines from A and C to the sun will be parallel; and hence the angle ZAS, or the meridian zenith distance of the sun at Alexandria, will be equal to the angle ACB. Knowing this angle and the distance AB, the rule of three gives the entire circumference.

Second Approximation.—No substantial advance beyond this first approximation was made until Newton showed that the gravitation and the rotation of the earth ought to make it somewhat flattened at the poles, or that the surface of the earth should have the shape of an oblate spheroid of revolution. The proof of this theoretical conclusion of Newton constitutes the second approximation to the figure and the size of the earth. Such a figure, however, is much more difficult of measurement than a spherical

FIG. 2.

figure. This is seen by a glance at Fig. 2, representing an ellipse, which, if revolved about its shorter axis PP' , will generate an oblate spheroidal surface. The principles of mechanics

EARTH

show that when such a surface is due to the attraction and the rotation of a fluid mass, the plumb line at any place will not in general point towards the centre of the mass, but will pass somewhat to one side of it, as shown by the line LQ in the figure.

Newton's conception, therefore, involved the difficulties of the more complex spheroidal figure and of the hypothesis that the earth was primitively a fluid mass. Two ways of testing Newton's views were proposed. One was to measure the meridional lengths of a degree of latitude at different places on the earth's surface. If the earth is an oblate spheroid, it is seen from Fig. 3 that the meridional distance along the surface intercepted by two plumb lines which make an angle of one degree (or any constant angle) with each other is greater at the poles than at the equator, or in general, greater in high than in low latitudes. The other method proposed to measure by means of the pendulum the varying acceleration to which a body is subject in different latitudes on the earth's surface. If the Newtonian view is correct, that acceleration, which is the resultant of the effects of attraction and rotation of the earth, and hence the weight of a body, must increase in passing from the equator to the poles.

FIG. 3.

But the Newtonian theory was neither readily accepted nor easily verified. In the early part of the 18th century, in fact, the theory was hotly opposed by the justly distinguished Cassinian school of French astronomers, whose erroneous interpretation of a carefully measured arc of a meridian in France indicated that the earth is an oblong rather than an oblate spheroid. The question was permanently settled by the famous Lapland expedition sent out by the Academy of Sciences of Paris, in 1735, under the auspices of Maupertuis and Clairaut. They proved beyond doubt that the earth's surface is very closely that of an oblate spheroid, thus "flattening the poles and the Cassinis," as Voltaire remarked at the time.

A vast amount of labor has since been devoted to the determination of the dimensions of the spheroid which best fits the earth's surface. This is, indeed, the principal problem of the precise geodesy of to-day. The dimensions of the earth which have been provisionally very generally adopted are those of General A. R. Clarke published in 1866. The theory of a spheroidal surface requires a knowledge of the lengths of the longer and the shorter axes of

the generating ellipse, or equivalent data. Generally the half axes, or the equatorial and the polar radii are given. The values of these are as follows:

Equatorial semi axis = a , polar semi axis = b .
 $a = 20,926,062$ feet = 3,963.3 miles = 6,378,259 meters.
 $b = 20,855,121$ feet = 3,949.8 miles = 6,356,635 meters.

It should not be inferred from these figures that the semi axes are known to the nearest foot or meter. The values given above are those derived from computations carried out to the nearest foot. More approximate values will be determined from computations now in progress, and they may possibly show Clarke's values to be in error by a few hundred feet.

The following derived values appertaining to the earth's spheroid are often referred to:

Equatorial diameter of the earth..... = 7,926.6 miles
Polar diameter of the earth..... = 7,899.6 miles
Difference of diameters..... = 27.0 miles
Circumference of equator of earth..... = 24,902.0 miles
Meridian perimeter of earth..... = 24,859.8 miles

Area of the surface of the earth $\left\{ \begin{array}{l} = 196,940,000 \text{ square miles} \\ = 510,071,000 \text{ square kilometers} \\ = 197 \times 10^9 \text{ square miles (about)} \\ = 51 \times 10^7 \text{ square kilometers (about)} \end{array} \right.$

Volume of earth $\left\{ \begin{array}{l} = 259,880,000,000 \text{ cubic miles} \\ = 1,083,200,000,000 \text{ cubic kilometers} \\ = 260 \times 10^9 \text{ cubic miles (about)} \\ = 108 \times 10^{10} \text{ cubic kilometers (about)} \end{array} \right.$

The following table gives the length of a degree of a meridian in different latitudes; the length of a degree in longitude measured along a parallel of latitude; and the areas of quadrilaterals of the earth's surface of one degree extent in latitude and in longitude. The latitude in the first column of the table is that of the middle point of the corresponding meridional arc or quadrilateral.

Latitude	Length of 1° of meridian	Length of 1° of parallel	Area of quadrilateral 1° × 1° in latitude and longitude
	Statute miles	Statute miles	Square miles
0°	68.703	69.171	4752.3
10	68.725	68.128	4682.0
20	68.786	65.026	4472.8
30	68.879	59.956	4129.6
40	68.993	53.063	3661.0
50	69.115	44.552	3079.2
60	69.230	34.674	2400.5
70	69.324	23.729	1645.0
80	69.386	12.051	836.2
90	69.407	00.000	

From the second column of this table it is seen that the length of a degree of a meridian is about seven tenths of a mile greater at the poles of the earth than at the equator.

Third Approximation.—A third approximation to the figure of the earth may be briefly referred to here. Imagine the mean sea level, or the surface of the sea freed from the undulations due to winds and to tides. This mean sea surface, which may be conceived to extend through the continents, is called the geoid. It does not coincide exactly with the earth's spheroid, but is a slightly wavy surface lying partly above and partly below the spheroidal surface, by small but as yet not definitely known

EARTH

amounts. The determination of the geoid is now one of the most important problems of geophysics. Its solution will be accomplished by means of gravimetric surveys, or by measuring the acceleration of gravity at a great number of points on the earth's surface.

PHYSICAL PROPERTIES OF THE EARTH.

The Atmosphere.—Adopting the convenient terminology of geologists, the earth may be divided into four parts, namely: the atmosphere; the hydrosphere, or oceans; the lithosphere, or crust; and the centrosphere, or nucleus. These are considered in turn without encroaching on the fields of the meteorologist or of the geologist.

The atmosphere is a gaseous envelope covering the earth to an extent not yet fully determined. The pressure it exerts at the surface of the earth is easily measured and is definitely known to be about 14.7 pounds per square inch, or about 1,033 grammes per square centimeter.

The pressure, density, and temperature of the atmosphere are observed to decrease rapidly with increase of height above the earth's surface, but the exact laws of decrease are not yet known. Hence it is impossible in the present state of science to assign a height to the atmosphere. It appears certain, however, that it is more than two hundred miles high, since it is dense enough to set meteorites on fire at that height.

Many investigations of the properties of the atmosphere have been made during the past century. These are all too technical for presentation, even in abstract, here. But their results may be summarized as follows:

(a) If the earth did not rotate and if the atmosphere were of the same density throughout as at the earth's surface, its height would be 26,200 feet, or about 5 miles.

(b) If the earth did not rotate, and if the adiabatic law (pressure proportional to the 1.4 power of the density) held in the atmosphere, it would be about 17 miles high.

FIG. 4.

(c) But the earth rotates and the atmosphere must be supposed to rotate with the same angular velocity. From this fact, and from the assumption that the atmosphere behaves like a fluid, Laplace concluded that it must be limited by a lenticular-shaped envelope as indicated in Fig. 4. The revolution of this figure about the axis LM, which is supposed to be coincident with the axis of rotation of the earth, E, will generate the envelope and the earth in their true relative dimensions. The polar and equatorial axes LM and AB are, re-

spectively, 4.4 and 6.6 times the diameter of the earth. According to this theory, therefore, the atmosphere may be about 17,000 miles high above the poles of the earth and about 26,000 miles high above the equator. The latter limiting height is that at which the centrifugal force due to rotation is just balanced by the attraction of the earth. The volume of the envelope is 156 times the volume of the earth. Whether the atmosphere actually extends to the limits thus defined has not been determined either by Laplace or by subsequent investigators.

A question of great interest is that of the quantity of the atmosphere, since the oxygen thereof is essential to the existence of all higher forms of life on our planet. By quantity is meant the amount of mass of the atmosphere. If the law of distribution of this mass within the Laplacian envelope were known the total quantity could be computed. But that law is not known, and hence it is only possible to attain an approximation, or to set limits, to the actual amount. A lower limit may be found from the adiabatic distribution of (b), above, for a non-rotating earth. This distribution does not differ widely from the actual distribution near the earth's surface; but since it is limited to a height of 17 miles it will give too small an amount. A computation on this basis makes the mass of the atmosphere 1-1700000th part of the total mass of the earth; or, in round numbers, one millionth part of the mass of the earth. This result is also reached, substantially, if it is assumed that the mass of the atmosphere is the same as the mass of a uniform layer of water, or mercury, which would produce the same pressure at the earth's surface. On the other hand, if the adiabatic distribution is supposed to hold within the Laplacian envelope, of (c), above, an upper limit of about 1-1200th of the mass of the earth is obtained. The actual value of the mass of the atmosphere is undoubtedly much closer to the lower than to the upper limit; but how much closer is still a matter for investigation.

The Hydrosphere.—It is well known that about three fourths of the earth's surface is covered by oceans and seas. Precise measures of the relative areas of land and sea are difficult to obtain, and the present state of knowledge does not justify the use of more than three significant figures in defining these areas. The values given below are derived from H. Wagner's 'Lehrbuch der Geographie.' They do not differ widely from the values given recently by other German authorities, though they make the total ocean area about one per cent greater than the earlier estimates of the distinguished British geographer, Sir John Murray. The table below gives the continental areas along with their average heights and the total oceanic area along with its average depth:

CONTINENT	Area in square miles	Average height or depth, in feet
Europe	3,860,000	980
Asia	17,100,000	3,120
Africa	11,500,000	2,130
North America	9,260,000	2,300
South America	6,840,000	1,970
Australia	3,440,000	1,370
Total continental area...	52,000,000	2,300
Total oceanic area.....	145,000,000	11,480

EARTH

The total area of the continents is, therefore, 26.3 per cent of the total surface of the earth; leaving, with the same degree of precision, for the total area of the sea surface 73.7 per cent of the surface of the earth.

The average depth of the oceans according to Wagner is 3,500 meters or 11,480 feet, or, in round numbers, 2.2 miles.

The data thus given show that the volume of the oceans is 315,000,000 cubic miles, or, in round numbers, 1-800th of the entire volume of the earth. Assuming the density of sea water to be 1.03 times that of pure water, and the density of the latter to be 62.3 pounds per cubic foot, the mass in the oceans is found to be 1.49×10^{18} tons of 2,000 pounds, or one and one half million million million tons.

It is interesting to contrast this mass of the oceans with the mass of the continents which lies above sea level. The average heights of the continents given in the above table require an average height for the entire land area of about 2,300 feet. This combined with the area of the continents gives for the volume of the continents above sea-level 22,500,000 cubic miles. If to this mass a density of 2.75 times that of water be attributed, the resulting mass of the continents above sea-level is 284×10^{15} tons. This is about one fifth the mass of the hydrosphere, or oceans.

The Lithosphere.—The lithosphere is the special province of the geologist, and is treated in detail under GEOLOGY. It is here considered, therefore, only in its broader physical aspects.

No precise value to the thickness of the shell which is called the crust can be assigned. The estimates of geologists make it 5 to 10 miles thick. It is the shell to which are confined the great rock movements and transformations with the attendant phenomena of crust crumpling, folding and faulting. For the present purposes it may be assumed to be 10 miles thick.

In its mechanical aspects the most important fact presented by the crust is that it rests on the centrosphere, or nucleus, in substantially the same manner as a fluid crust would. In other words, the crust is essentially, in view of the forces to which it is subject, a viscous mass, which may be likened in its behavior to sealing wax. This conclusion is reached when one compares the compression to which the crust would be subjected if it were self supporting, like a dome, with the crushing strength of rocks. That compression is about thirty times the crushing strength of the finest steel and five hundred to one thousand times that of the best building stones. Hence we must infer that at a depth of a few miles there can be no such thing as a cavity in the crust. Another conclusion of great importance, also, is that the surface shape of the earth must conform very closely to the shape it would have if it had been originally fluid, as assumed by nearly all geodesists and geologists, many of whom adduce that shape as a proof of primitive fluidity. Given time enough, and the amount of time available is ample, as seen below, the viscous earth will assume the same shape, essentially, as a fluid earth.

Since the lithosphere, the hydrosphere, and the atmosphere are the theatre of the principal activities, physical and biological, of our planet, it is of interest to know their volume, mass, and chemical constitution. The volume of the shell

10 miles thick below sea level is 1,969,400,000 cubic miles. Adding to this the volume of the crust above sea level, namely, 22,500,000 cubic miles, there results for the volume of crust and hydrosphere down to a depth of 10 miles below sea level, 1,992,000,000 cubic miles. Of this, as stated above, 315,000,000 cubic miles are sea water, leaving for the solid matter of the crust to the depth in question 1,677,000,000 cubic miles. Attributing to this volume a density 2.75 times that of water, the mass of this solid part of the shell is 21×10^{18} tons of 2,000 pounds. This is about 14 times the mass of the oceans. These two masses and that of the atmosphere give, in round numbers, a total of 23×10^{18} tons, the contribution from the atmosphere being taken as 7×10^{16} tons.

CHEMICAL COMPOSITION OF THE LITHOSPHERE, HYDROSPHERE, AND ATMOSPHERE.

ELEMENT	Solid crust	Oceans	Mean, including atmosphere
Oxygen	47.29	85.79	49.98
Silicon	27.21	...	25.30
Aluminum	7.81	...	7.26
Iron	5.46	...	5.08
Calcium	3.77	0.05	3.51
Magnesium	2.68	0.14	2.50
Sodium	2.36	1.14	2.28
Potassium	2.40	0.04	2.23
Hydrogen	0.21	10.67	0.94
Titanium	0.33	...	0.30
Carbon	0.22	0.002	0.21
Chlorine	0.01	2.07	0.15
Bromine	0.008	...
Phosphorus	0.10	...	0.09
Manganese	0.08	...	0.07
Sulphur	0.03+	0.09	0.04+
Barium	0.03	...	0.03
Nitrogen	0.02
Chromium	0.01	...	0.01
	100.00	100.00	100.00

Professor F. W. Clarke, making use of the above data, has worked out the relative abundance of the chemical elements in the combined mass of the atmosphere, the hydrosphere and the lithosphere. His results are given in the preceding table. (See Bulletin of the United States Geological Survey, No. 78.) It is interesting to note that nearly one half of that part of the mass of the earth visible to us is oxygen, the next most abundant contributions being in order, silicon, aluminum, iron and calcium.

The Centrosphere.—Since the crust of the earth, as seen above, rests like a viscous fluid on the centrosphere, the latter, whatever its temperature and other properties, must be subject to great internal stress. Indeed, the mechanics of celestial bodies of large mass leads inevitably to the conclusion that pressure is the dominant factor in the earth at no great depth below the surface. Given time enough, therefore, the distribution of pressure will be essentially the same as if the mass of the earth were fluid. This justifies the application of the laws of hydrostatics to the earth as a whole, whether it was originally fluid or not. With this concept, and with the law of gravitation, several facts enable us to determine within narrow limits what must be the constitution of the earth as regards distribution of density, gravity and pressure. The principal of these facts are (1) the surface

EARTH

density, (2) the mean density, and (3) the surface value of the acceleration of gravity. In addition to these facts, there are some others of less importance depending on the attraction of external bodies on the earth. Laplace correlated all these facts by means of an hypothesis with regard to the compressibility of matter. This asserts that the pressure in the earth increases as the square of the increase in density.

Adopting the indications of Laplace the following table showing the variation of density, acceleration of gravity, and pressure with depth below the surface of the earth has been computed. The relatively unimportant effect of the rotation of the earth is ignored in the calculation. The assumed values of the surface density and the mean density are 2.75 and 5.5, respectively, times that of water. In the third column of the table g represents the average surface value of the acceleration.

DISTRIBUTION OF DENSITY, ACCELERATION, AND PRESSURE IN THE EARTH.

Depth in fractions of earth's radius	Density relative to water	Acceleration of gravity	Pressure in millions of pounds per square inch
0.0	2.75	1.00g	
0.1	3.9	1.04	3.09
0.2	5.0	1.04	7.24
0.3	6.2	1.00	12.42
0.4	7.2	0.94	18.37
0.5	8.2	0.84	24.53
0.6	9.1	0.72	30.61
0.7	9.8	0.55	35.99
0.8	10.3	0.38	40.30
0.9	10.7	0.20	43.04
1.0	10.8	0.00	43.96

It is seen from this table that the acceleration attains a maximum value. This value is 1.05 times the surface value and it is attained at a depth of about 610 miles. At this depth a given mass would have a greater weight than at any other distance from the earth's center. A more extended table, computed by the author from slightly different data, is given in the article on GEOLOGY.

The variation of the density, acceleration and pressure are shown graphically in the following diagram, Fig. 5, in which these quantities are all measured horizontally from the line AO, representing the earth's radius, to the right. The curves have different horizontal scales and are designated, respectively, D.C. (density curve), A.C. (acceleration curve), and P.C. (pressure curve). The pressure curve intersects the axis OQ at right angles at Q.

Another interesting question in this connection is what total radial compressibility is compatible with this Laplacian distribution of density, acceleration and pressure. The answer may be stated in convenient form thus: If the pressure of the atmosphere were to be doubled the radius of the earth would be shortened everywhere by about 2 meters, or 6.5 feet. This explains how mere inequalities in surface loading of the earth may account for some of the great observed movements of the earth's crust.

Acceleration at Surface of Earth.—What is commonly called the acceleration of gravity at the surface of the earth is the resultant of the accelerations due to the attraction and to the

rotation of the earth. This quantity has been measured with considerable precision at various points of the earth's surface by means of the pendulum, and the results have been combined in the following formula, g being the accelera-

FIG. 5.

tion at any point of the sea level whose latitude is ϕ :

$$g = 978.00 + 5.22 \sin^2 \text{ centimeters / (seconds)}^2 \\ = 32.087 + 0.171 \sin^2 \text{ feet / (second)}^2.$$

Mean Density and Mass of the Earth.—Since the volume of the earth is known accurately, the mass can be computed if its density can be ascertained. The author has recently shown (The Astronomical Journal, No. 424), that the product of this mean density and the gravitation constant may be derived with a precision comparable to that of the value of the acceleration just given above. The gravitation constant is the quantity essential to convert the proportionality of Newton's law of gravity into an equality. That is, if m and m' are two masses, D their distance asunder, F the force of attraction they exert on one another, and k the gravitation constant, then

$$F = k \frac{mm'}{D^2}.$$

It is thus seen that k is not a mere number, but a quantity such that the second member of the equation is force as well as the first member. k is, in fact, the cube of a length divided by the product of a mass and the square of a time.

Denoting the mean density of the earth by ρ , it is found in the paper referred to that

$$k\rho = 36797 \times 10^{-11} / (\text{second})^2.$$

this quantity being the reciprocal of the square of a time. In a more interesting, as well as a more intelligible, form this relation may be written

$$k\rho = \frac{3\pi}{T^2}$$

where π is the number 3.1415+ and T is the time it would take an infinitesimal satellite to pass around the earth, under the law of gravi-

EARTH

tation, just grazing the equator, if there were no atmosphere to impede its progress. This time is seen to be 1 hour, 24 minutes, 20.9 seconds.

It is clear then that ρ will be given by the above equation if k is known. This quantity has been measured directly by several observers. A mean of the most recent and most trustworthy determinations is, in C.G.S. units. (See 'The Century's Progress in Applied Mathematics,' Science, N. S., Vol. XI.)

$$k = 6673 \times 10^{-11}.$$

Thus ρ is found to be 5.514 times the density of pure water. The uncertainty of this value as shown by the computation is about four units in the last place of decimals. In view of this fact, and of the great difficulties in measuring the quantity k , we shall use the round number 5.5 as hitherto.

From the volume of the earth given above the following results are derived for its mass:

$$\begin{aligned} \text{Mass of Earth} \quad \left\{ \begin{array}{l} = 1,311 \times 10^{21} \text{ pounds} \\ = 6,352 \times 10^{18} \text{ tons (of 2,000 pounds)} \\ = 5,945 \times 10^{20} \text{ kilogrammes} \end{array} \right. \end{aligned}$$

For convenience of reference the masses that have been given above are here collected and expressed in tons of 2000 pounds.

Mass of Earth	= $6,550 \times 10^{18}$
Mass of Centrosphere	= $6,529 \times 10^{18}$
Mass of Lithosphere	= 21×10^{18}
Mass of Hydrosphere	= 1.49×10^{18}
Mass of Atmosphere	= 7×10^{15}

The Internal Heat of the Earth.—That the earth has a great store of heat a few miles below the surface is amply proved by a variety of geological phenomena. Wherever deep wells, or bore holes, have been sunk the temperature is observed to increase with depth at a rate of about a degree F. for 60 feet. This shows that heat is being conducted from the interior to the surface of the earth and is thence radiated into surrounding space. The amount of this heat is sufficient to melt a layer of ice 6 to 8 millimeters (or $\frac{1}{4}$ inch, say) thick, covering the globe, per annum, or more than 800 cubic miles of ice. It seems most probable (though it is by no means certain) that the temperature of the centrosphere is high enough to melt all known rocks, although the lower strata of the crust do not assume the molten or viscid form of lavas except on relief from the great pressure to which they are subject. This was, essentially, the view of Fourier, the earliest physicist to investigate this question, and it is still regarded as the most plausible hypothesis with respect to the actual state of the earth.

Whether this hypothesis is exact or not, however, the theory of heat conduction founded by Fourier enables us to draw with certainty two important conclusions with respect to the earth, namely: (a) that the heat conducted from the interior to the surface escapes as if there were neither atmosphere nor oceans; and (b), that a million years is the smallest unit of time convenient for measuring the historical succession of thermal events.

With less certainty it may be affirmed that the earth is shrinking in bulk as it cools, and that this is one of the principal causes of the grand crust crumpings and volcanic activities to which geologists pay special attention. This cubical contraction goes on exceedingly slowly, however; requiring, so far as one can infer from

present indications, nothing short of thousands of millions of years for its completion.

The Earth as a Time Keeper.—The time of rotation of the earth is the most trustworthy unit of time man has discovered. The present value of this unit is 86164.1 mean solar seconds. That the earth must rotate with great steadiness is at once apparent when the immense amount of its energy of rotation is considered. This energy is about 156×10^{27} foot-pounds, or 2×10^{30} ergs. It is more than will be developed at Niagara (at the present rate of 5 million horse-power, say) in a million million years. Nevertheless, the period of rotation of the earth is subject to variation from four obvious causes. These are (1), secular contraction of the earth's mass; (2), the influx of meteorites, or meteoric dust; (3), tidal friction; and, (4), shiftings in position of the surface load of the earth, as in the processes of sedimentation, glaciation, etc.

The effects of the first two causes have been investigated. ('The Astronomical Journal,' No. 502.) Contraction tends to shorten the day, and may possibly cause a diminution of as much as six per cent of the present length. The change goes on very slowly, however, and will not be perceptible in any such interval as that of human history (20 centuries, say). Meteoric dust tends to lengthen the day; but at the present rate of influx (about 20 millions of meteorites daily) the effect will not amount to so much as a quarter of a second in less than a million million years. During this interval of time the total effect, substantially, from secular contraction will have accrued.

The effects of the other causes named have not been evaluated, though the last one is probably the most important of all of them; since it may be easily shown that such shiftings of the surface load as are now taking place on the earth may modify the length of the day by an amount which, if cumulative, might in a few centuries seriously disturb astronomical reckonings.

Professor of Mechanics and Mathematical Physics, Columbia University.

Earth, Race Population of the. The total population of the earth is estimated at 1,440,650,000, divided among the following races: Mongolian, 650,000,000; Indo-Germanic, 545,500,000; negro, 150,000,000; Semitic, 65,000,000; Malay, 35,000,000; Indian, 15,000,000; Hottentot, 150,000. The human family is subject to 45 principal governments. The average duration of human life is estimated at 33 years. The deaths are calculated at 67 per minute, 97,970 per day, and 35,639,835 per year; the births at 70 per minute, 100,800 per day, and 36,792,000 per year. One quarter of the people of the earth die before age 6, one half before age 16, and only one in 100 attains to the age of 65.

EARTH CURRENTS—EARTH, INTERNAL HEAT OF

Earth Currents, a term used in electricity. Telegraph lines and particularly long submarine lines, are constantly troubled by violent electrical disturbances of the nature of transient currents which rush in one direction or the other through the line. The name earth currents is given to these movements of electricity. They are frequently so powerful and so changeable as to render the use of the telegraphic instruments for the time impossible, the earth currents passing so rapidly as to confuse the speaking signals completely. The nature of these disturbances is not thoroughly understood. They are found, however, to be very intimately connected with the perturbations of terrestrial magnetism called magnetic storms, and these, it is well known, are closely connected both with the appearance of the *aurora borealis*, and with the occurrence of the sun's spots. It seems probable that earth currents and the aurora are due to secondary discharges taking place in consequence of alterations in terrestrial magnetism, and that these alterations in terrestrial magnetism are caused by violent solar disturbances.

Earth-houses, a name generally given throughout Scotland to underground buildings, also known as "Picts' houses" or "Picts' dwellings." The earth-house in its simplest form consists of a single irregular-shaped chamber, formed of unhewn stones, the side walls gradually converging toward the top until they can be roofed by stones of four or five feet in width, all covered in by a mound of earth rising slightly above the level of the surrounding district. In the more advanced form of these structures two or three chambers are found. Earth-houses are frequent in the northeast of Scotland, occasionally 30 or 40 being found in the same locality. Very similar structures, known as bee-hive-houses, occur in Ireland. In the United States modern earth-houses are to be found in Nebraska, Kansas and other western States, and are commonly called "dug-outs." In Arizona and California certain dwellings of adobe may be designated as earth-houses. See ADOBE.

Earth-shine is the light reflected from the sunlit surface of the earth on the obscured portion of the moon's surface, for a few days before and after new moon, rendering it faintly luminous with a dark grayish light, and giving it the appearance popularly known as "the old moon in the new moon's arms." The phenomenon is stronger before than after new moon. See MOON.

Earth, Internal Heat of. There is abundant evidence that the interior of the earth is warmer than the surface. All deep mines, tunnels, and borings show a temperature considerably in excess of that which prevails in the shallower strata. At Rosebridge Colliery, near Wigan, England, a temperature of 94° F. was found at the depth of 2,445 feet, although the mean temperature of the surface is only about 49°. We have thus an increase of 45°, which is at the rate of about 1° for every 54 feet of depth. In the Mont Cenis tunnel, at one part where there is a thickness of a mile of rock overhead, the temperature was 85°. The tempera-

ture at the depth of 400 metres in the well of Grenelle at Paris is 75°, the temperature of the superficial strata being about 52°. In a bore through rock-salt at Sperenberg, near Berlin, the temperature at the depth of 3,490 feet was found to be 116°, the mean temperature of the air at the surface being only about 48°. At Yakutsk, in Siberia, where the mean temperature of the air is 13½°, it was found, in sinking a well to the depth of 540 feet, that the soil (which was frozen for the entire depth) increased in temperature by about 1° for every 52 feet of descent.

There is usually a considerable amount of irregularity in the rate of increase at different depths. In a deep boring at Wheeling, W. Va., the increase in the 1,000 feet from 2,375 feet to 3,375 feet is about 13°, while the increase in the next 1,000 feet is more than 16°, the temperature at that depth being 108°. Also, the mean rate of increase is by no means the same at all places, being sometimes as rapid as a degree for every 40 feet, and sometimes as slow as a degree for every 80 feet. Its average value appears to be about a degree (F.) for 50 or 55 feet.

The simplest theory to account for the increase of temperature in descending is that which supposes that the earth has formerly been at a high temperature throughout and is gradually cooling. This theory has been fully developed by Lord Kelvin. Solid rock has greater specific gravity than melted rock, even at the same temperature. Hence, if the earth were originally melted, and were then subjected to loss of heat from its surface, the solid crust which would form would from time to time fall in and allow fresh portions of liquid to come to the surface, until a solid interior had thus been formed, containing perhaps numerous cavities filled with liquid, but having on the whole the characteristics of a solid globe. After this stage a few hundred years would suffice to make the surface nearly as cool as it is at present, although a temperature nearly as high as the melting-point of rock would still exist at the depth of a few feet. The cooling would gradually penetrate deeper, and the rate of increase of temperature with depth would become slower, until, after about 100,000,000 years, this rate would be reduced to the value which it has at present. If we suppose the earth not to have been originally melted, but to have had a temperature considerably below the melting-point, a still shorter period of time would suffice to bring about the present condition of things. Hence Lord Kelvin argued that the age of the earth, as a globe cool enough for habitation cannot be greater than about 100,000,000 years. Professor Tait, on revising the physical data on which this calculation was based, came to the conclusion that the limit must be drawn still closer, namely, at about 10,000,000 years.

It was, until quite recently, maintained by geologists that the solid part of the earth consisted only of a thin crust enclosing a molten interior. This has been disproved by Lord Kelvin, both by the line of argument above sketched, and also by another argument based on the phenomena of the tides. A thin crust enclosing a liquid or pastry interior would yield and change its shape under the action of those forces (emanating from the moon and sun) which produce the tides. Evidently if the sur-

EARTHENWARE—EARTHQUAKE

face and bottom of the sea at a given place rise together and fall together, the depth of water may remain unaltered. The observed effect is the difference between the tide at the surface and the tide at the bottom. Hence the observed effect will be greater with a rigid than with a yielding earth. Now the observed effect agrees with what calculation gives on the supposition that the earth taken as a whole is highly rigid, and is completely at variance with calculation on the supposition that the earth is highly flexible.

Volcanic eruptions have an obvious connection with the question of the condition of the earth's interior. According to one theory they are due to local generation of heat by friction. The outermost layers of the earth have long since attained a nearly permanent temperature. The layers below them are cooling more rapidly, and have therefore a tendency to shrink faster. This tendency finds its relief from time to time in dislocations, which are the source of earthquakes, and which frequently involve the rubbing of one part against another under the enormous pressure of the superincumbent weight. Such friction would certainly involve an enormous local development of heat. See EARTHQUAKE; VOLCANO.

Earthenware, vessels or objects of clay, as distinguished from porcelain, is opaque, as distinguished from stoneware the body is dull and earthy. The clay is baked or fired in a kiln, or more rarely sun-dried. The glaze depends on the quality of the ware; generally it is of a readily fusible character and contains lead; but a simple salt glaze is employed for common articles. Occasionally the unglazed body is employed, as for water-bottles, cream-jugs, vases, and ornaments; these have generally a reddish-brown color, due to iron. The finer kinds of earthenware, such as Majolica, Delft ware, Faience, and Palissy ware, are not only glazed, but are besides elaborately colored and enamelled and ornamented with raised figures of various kinds. See FAIENCE; POTTERY.

Earthnut, a common name for many unrelated plants. The most common are probably the following: *Bunium flexuosum*, and *B. bulbocastanum*, both members of the natural order *Umbellifera*, the latter referred by some botanists to the genus *Carum* (caraway). Certain species of *Carum*, *Cenanthe*, and *Cherophyllum* of the same natural order, also bear this common name. All these species are natives of Europe and all bear tubers which have been used to some extent for human food, but are more valued as food for swine, since the animals can be turned loose to root them out of the ground. They are also known as earth chestnuts, pig-nuts, etc. Certain species of *Cyperus* of the order *Cyperaceæ* are also called earthnut (see NUT-GRASS), and so are various species of the natural order *Leguminosæ*, especially *Arachis hypogæa* (see PEANUT), *Apois apios*, or *tuberosa* (see GROUND-NUT), known also as wild bean.

Earthquake, a trembling of the earth's crust due to internal causes. It consists of a series of undulatory impulses or elastic waves, transmitted through the rocks of the crust in somewhat the same way that sound is transmitted through the air. These waves are of two classes: (1) compression waves propagated

parallel to the direction of transmission; (2) distortion waves normal to the direction of transmission. The speed with which these waves are transmitted varies greatly. It is greatest near the starting point and diminishes somewhat as the waves die out. The speed is also affected by differences in the elasticity and homogeneity of rock masses. In general it varies from several hundred to several thousand feet per second. The waves of the Charleston earthquake, 31 Aug. 1886 (the data were carefully compiled), had the great speed of nearly 16,000 feet per second. The destructive effects of earthquakes are due to the high velocity of the undulatory impulses rather than to the amplitude of the vibrations since the latter is usually only a very small fraction of an inch and but rarely is as much as two inches.

The violence of earthquakes varies greatly. Delicate instruments, seismographs, constructed to show variations in the stability of the earth's crust, show that the crust is almost continually trembling even in regions where shocks of some magnitude are rarely felt. Earthquakes are sometimes classified as central and linear: in the first the undulatory impulses radiate from a centre of origin or focus in all directions; in the second the strong impulses are felt along narrow strips of the earth's crust. If rocks were of equal elasticity and an earthquake focus were a point, the undulatory impulses would travel outwardly in all directions and at the surface of the earth points equally distant from the focus or seismic centre, would feel the shock at the same moment and the isoseisms or lines drawn through places simultaneously affected would form circles. The point over the seismic centre when the shock is vertical is termed the epicentrum. The results from the study of earthquake data are often variable and puzzling and the determination of the focus is not an easy matter. In general the seismic centre has been found to be not a point but an area and in the case of the Agram earthquake in Hungary (1880), the area must have been large since vertical impulses were felt over a considerable region. It is also known that the seismic centre is very seldom 30 miles below the surface and the commonest depth is 8 or 10 miles. The seismic centre of the Charleston earthquake was at a depth of about 12 miles.

An earthquake tremor may be felt on the surface distinctly and not in the lower levels of a deep mine and *vice versa*. The size of the area when the trembling is perceptible probably bears some proportion to the violence of the initial shock. The great Lisbon earthquake (1775) was distinctly felt from Madeira to Great Britain or over the whole of southwest Europe and northwest Africa. The Charleston earthquake was felt from northern Florida to New England and as far west as Iowa, or over an area approximately 1,000 miles long and 800 miles wide. In the Lisbon earthquake the tremors lasted but about six minutes. In the Calabrian earthquakes (1783-7) the trembling was practically continuous for four years. When an earthquake occurs beneath the sea, the ocean above is uplifted and the shock spreads outwardly in low long waves that travel rapidly but are slower than the earth waves. In mid-ocean such waves are of no importance, but as they approach shore the drag of the sea bottom decreases their speed and length, but greatly increases their height, and

EARTHS

what are erroneously termed tidal waves result. On a low-lying coast such waves may be very destructive. The explosion of Krakatoa in August 1883 caused sea waves that went around the world at a speed of 400 miles an hour. At distant points like the coast of Europe, the waves were slight, and were detected by tide gauges. On the coast of Java the waves were over 60 feet high and thousands of people were drowned. An earthquake in the North Pacific in June 1896 caused waves 40 feet high along the northern coast of Japan, that did great damage, over 27,000 people being drowned. Such an earthquake wave on the coast of Peru once picked up a gunboat of the United States navy and left it stranded a mile inland. Earthquakes are usually commonest in regions of present or recent volcanic activity. In the United States they are commonest in California, and in general earthquakes are more often felt near the coasts than inland, just as volcanoes are more often found near the sea. At the same time there is a seismic zone encircling the whole earth in which earthquakes are more numerous than elsewhere, and this zone does not coincide with the distribution of volcanoes. The zone includes Central America, the West Indies, the Azores, Italy, Syria, Persia, Afghanistan, Tibet, Japan, and Hawaii. It is by some regarded as the real earthquake centre, since shocks in regions without the belt are sometimes traced to disturbances within it. Thus the earthquakes of the Mississippi valley (1812) ceased when the volcano of St. Vincent, 2,000 miles distant, burst into activity. The sounds that accompany earthquakes have been variously compared to the rumbling of thunder, the clanking of chains, etc.; sometimes loud sounds accompany slight shocks.

Causes of Earthquakes.—As earthquakes are frequently connected with the eruptions of volcanoes, and are common in volcanic regions, many observers have thought that earthquakes were volcanic phenomena. This view was first expressed nearly 2,000 years ago by Pliny, and during the first half of the 19th century was held by many geologists including von Humboldt. From the fact, however, that many earthquakes in the countries about the Mediterranean, in California, and elsewhere, are not accompanied by any volcanic activity, and since any heavy shock or blow within the earth's crust would be propagated by undulatory impulses to the surface, causing an earthquake, it is now generally recognized that earthquakes are due to a variety of causes. It is plain that some earthquakes are due to the explosions of steam that are the chief characteristics of violent volcanic eruptions. Thus the terrific explosion that tore off the greater part of the island of Krakatoa (1883) was the cause of a violent earthquake. Earthquakes frequently precede volcanic outbursts and cease as the eruption begins. Again it is possible that in regions of present or recent volcanic activity when no volcanic outbreak accompanies or follows an earthquake the latter may have been caused by movements of molten rock deep underground. The sudden expansion of such rock, if pressure were relieved by the opening of some fissure, as in the formation of dikes, might cause a severe earthquake. In regions remote from volcanoes it is probable that earthquakes are caused by the same stresses in the earth's crust,

partly due to secular contraction, that tilt and fold rock strata into mountains. The strains to which the rocks are thus subjected when suddenly relieved by the rocks giving way produce many earthquakes. In fact, the slight earthquakes of frequent occurrence in the Alps, Himalayas, and in southern Oregon, indicate that mountain building is still in progress. The seismic zone that encircles the earth is, therefore, simply a zone of weakness in the earth's crust, within which crustal movements are frequent. Earthquakes in regions remote from any volcano have usually, when carefully studied, been traced to some line of rock weakness as a fault. Such earthquakes are merely phenomena accompanying rock movements that may in time greatly modify the earth's surface. The frightful loss of life caused by some violent earthquakes has led to their geological importance being exaggerated. Many earthquakes in Japan are believed to be caused by accumulations of submarine sediments sliding down the steep slope of the continental shelf just east of Japan.

Effects of Earthquakes.—Aside from the destruction of life and property the work done by most earthquakes is relatively unimportant. Of geological effects may be mentioned landslides in mountainous regions, as in the earthquakes in 1870 in northwestern Greece. Such landslides may divert the course of streams. Violent earthquakes are frequently accompanied by the opening of fissures in the ground, which may or may not close again. Several were formed in the Charleston earthquake, while the Mississippi valley earthquake resulted, apparently, in depressions of the surface over considerable areas. As noted before, earthquakes frequently accompany the formation of faults. Thus the Owen's Valley, Cal., earthquake (1872), accompanied the formation of faults along the base of the Sierra Nevada, the maximum throw being 20 feet. In the Lisbon earthquake that killed 60,000 people, the quay sank into the sea, with all the people near it. In the Calabrian earthquake (1783), which killed 32,000 people, more than 200 lakes and small swamps were formed. Lyell says an earthquake at the mouth of the Indus (1819) resulted in forming a lake covering 2,000 square miles. While downward displacements of the earth's crust are of common occurrence, elevations are much less common and some geologists deny that any elevation has ever been observed after an earthquake. See MOUNTAIN; TIDAL-WAVE; VOLCANO; EARTH, INTERNAL HEAT OF, etc.

SAMUEL SANFORD,
Engineering and Mining Journal.

Earths, a term applied by alchemists to substances which were considered elementary bodies, but since the researches of Lavoisier and Sir Humphry Davy, defined as metallic oxides, or compounds of oxygen with metals similar to potassium and sodium. Earths are seldom found in a state of natural purity, but constitute chiefly, the component parts of gravel, soil, and strata. The more important earths are divided into two classes; alkaline earths,

EARTHWORKS—EASEMENT

lime, baryta, strontia, and magnesia; and proper earths, alumina, zirconia, glucina, yttria, and thorina; most of these are treated under separate titles, to which refer. The alkaline earths resemble the alkalis. They are soluble in water; baryta and strontia readily, lime sparingly, and magnesia very slightly. Their solutions affect vegetable colors similarly to the alkalis. They combine with acids, forming neutral salts, some of which are readily soluble in water, and others insoluble. The proper earths are insoluble and infusible, and by exposure to heat lose the property of easy solubility in acids.

Earthworks, in military parlance, are permanent or temporary defenses chiefly of earth forming a shield against the enemy's fire. For the various forms of military earthworks see FORTIFICATION; TRENCH.

Earthworm, annelid of the order *Oligochaeta* (q.v.). Although certain families of *Oligochaeta* are strictly aquatic and others exclusively terrestrial, still others contain both aquatic and terrestrial species, and aside from peculiarities which are obviously adaptations to the mode of life no sharp distinctions can be drawn between these two classes. The earthworms generally are larger and more robust, with shorter setæ than the waterworms, and have dorsal pores. Within recent years the earthworms have attracted much attention from systematic writers and no less than 800 species, of which upwards of 90 inhabit North America, are now known. Externally they look much alike, but in their internal anatomy exhibit an astonishing variety. The common earthworms of Europe and America, of which a dozen or more species may be found in almost any suitable locality, belong chiefly to the genera *Lumbricus* and *Allolobophora* which have the setæ arranged in four pairs on each somite, a well-developed girdle or clitellum occupying a variable number of segments toward the anterior end, the female and male genital pores on the 14th to 15th segments respectively, and various complex internal peculiarities of the reproductive organs. While our species rarely equal a foot in length, several South African and Australian species reach five feet. Earthworms inhabit nearly all parts of the earth except the frozen regions of high latitudes and altitudes, dry sandy soils, and some portions of the North American prairies. Their habits are everywhere much alike. They burrow in damp earth, which the common kinds penetrate to the depth of about two feet. They swallow the soil, and after digesting its nourishing elements reject the rest in the form of castings from the mouths of their burrows. At night they partly leave their burrows and draw to them the petioles of leaves, etc., on which they feed and with which they close the openings in cold weather. In this way they also seek one another's company and copulate, as hermaphrodites mutually fertilizing each other. A cocoon is formed by secretions of the clitellum and receives the eggs and spermatozoa in a quantity of albumen as it slips past the openings of the genital ducts toward the head, from which it passes and remains in the earth. During the winter they burrow to a depth beyond the reach of frost, but some species at least will survive actual freezing. The importance of earthworms as cultivators of the soil can scarcely be over-

estimated. By their burrowing they render it porous and permeable to the rain and air; they continually turn the earth by bringing up soil from beneath the surface, and they add to its fertility by burying vegetable matter and by their secretions. Darwin has estimated that earthworms bring to the surface in rich meadow lands not less than one fifth inch of soil per annum, and recent laboratory experiments demonstrate most emphatically the beneficial influence on plants of the presence of earthworms. Consult: Beddard, 'Monograph of the Oligochaeta,' and Darwin, 'Formation of Vegetable Mould.'

Earwig, an orthopterous insect, forming type of a family, *Forficulidae*, and an order *Dermaptera*. This insect has generally a habit of concealing itself in cavities, endeavoring to reach their innermost recesses, and in some rare cases may have sought a hiding place in the ear, but its passage into the internal ear would be stopped either by the waxy secretions or by the tympanic membrane. The common earwig (*F. auricularia*) is found throughout Europe, in north Africa, Asia Minor, and North America. It has a length of from two fifths to two thirds of an inch; the antennæ are thread-like, and the number of joints is 15. The fore wings are short, horny, and somewhat rectangular, but the larger hind wings are thin and mainly membranous, and fold up somewhat like a fan under the fore wings. The last segment of the abdomen carries a pair of curved, horny, pincher-like appendages, which in the male are toothed at the base. The eggs are laid in spring, about 20 at a time, and are carefully protected by the female. The young earwigs differ little except in size from the mature insects; they are guarded by the mother during the first period of their existence. Earwigs shun light as far as possible and this habit is taken advantage of by gardeners to catch them and destroy them. In the daytime they may be found in various situations, such as beneath the bark of trees, under stones, in the soil, or in any suitable hole. They feed on fruits, seeds, leaves, and flowers, and at times on animal refuse. Eight other species of this genus are found in Europe. In the genus *Chelidura*, represented in Europe by nine species, the wings are altogether wanting. *Labia* is another genus with only one European species (*L. minor*), which is common in Great Britain about manure heaps and similar habitats.

Easement, an incorporeal hereditament, comprising a permanent public or personal right as legal owner of one parcel of land, to use, or forbid its use, for some special purpose, with regard to a parcel of land belonging to another owner. This definition includes easements strictly so called, which are always appurtenant to land, public easements, and easements in gross or such as are attached to the person. In more general terms it is said that the right of making use of the land of others, whether it be that of the public or individuals, for a precise and definite purpose, not inconsistent with a general right of property in the owner, especially where it is for the public use, is in legal contemplation an easement or franchise, and not a grant of the soil or general property. In the civil law the land against which the privilege exists is called the servient tenement; its proprietor the servient owner; he

EAST—EAST AFRICA

in whose favor it exists, the dominant owner; his land the dominant tenement. And, as these rights are not personal and do not change with the persons who may own the respective estates, it is very common to personify the estates as themselves owning or enjoying the easements. Easements have these essential qualities. There must be two tenements owned by several proprietors: the dominant, to which the privilege is attached; the servient, upon which it is imposed. Considered strictly, easements exist only in favor of, and are imposed only on, corporeal property. They confer no right to any profits arising from the servient tenement. They are incorporeal. At common law they may be temporary; by the civil law, the cause must be perpetual. They impose no duty on the servient owner, except not to change his tenement to the prejudice or destruction of the privilege. Easements are of various kinds. They are as various as the exigencies of domestic convenience or the purposes to which buildings or land may be applied. The following attach to land as incidents or appurtenances, to wit: The right of pasture on other land; of taking game on other land; of fishing in other waters; of taking wood, minerals, or other produce of the soil from other land; of receiving air, light, or heat from or over other land; of receiving or discharging water over, or having support to buildings from other land; of going on other lands to clear a mill stream, or repair its banks, or draw water from a spring there, or to do some other act involving ownership; of carrying on an offensive trade; of burying in a church, or a particular vault, etc. Some of these are affirmative or positive, that is, authorizing the commission of acts on the lands of another actually injurious to it, as a right of way,—or negative, being only consequentially injurious, as forbidding the owner from building to the obstruction of light of the dominant tenement. Easements of every kind must originate in a grant or agreement, express or implied, of the owner of the servient tenement. By the common law, the evidence of their existence may be by proof of the agreement itself, or by prescription, requiring actual and uninterrupted enjoyment immemorially, or for upward of 20 years, to the extent of the easement claimed, from which a grant is implied. Easements of the negative kind do not admit of possession, and by the civil law they cannot be acquired by prescription, and can only be proved by grant. Use is not essential, therefore, to their existence. Easements may be extinguished by release; by merger, when the dominant and servient tenements are united under the same title and to the same person; by necessity, as by a license to the servient owner to do some act incompatible with its existence; by cessation of enjoyment, when acquired by prescription,—the non-user being evidence of a release where the abandonment has continued at least as long as the user from which the right arose. A shorter time will answer in some cases.

East, Alfred, English artist b. Kettering, Northamptonshire, 15 Dec. 1849. He studied in Paris at the *École des Beaux Arts* and under Julian and Bouguereau. He has exhibited at the Royal Academy for many years, and among his works are: 'A Passing Storm,' in the Luxembourg, Paris; 'A Haunt of Ancient Peace,' in

the National Gallery of Hungary; 'The Nene Valley,' in the Permanent Gallery of Venice; 'An Idyl of Spring,' in the Preston Gallery.

East, a cardinal point of the compass, and the quarter of the heavens in which the celestial bodies make their appearance. The exact direction may be determined by the eastern right angle of a perpendicular meridian line, which points due east. East differs in direction for each locality on the earth's surface, at the poles, however, there being neither east nor west. In European countries the East, also called the Orient, signifies the countries of Asia lying east and southeast of Europe. In the western parts of the United States the East is a colloquialism for the region east of the Mississippi River, more especially that north of Maryland and of the Ohio River.

East Africa, British, comprises an area of over 1,200,000 square miles, situated to the north of German East Africa and south and west of Italian Northeast Africa, and extending inland to the Congo State and the Anglo-Egyptian Sudan, but here the boundaries are not definitely settled. It has a coast line of about 450 miles, from the river Umba on the south to the river Juba on the north. This vast region has a population estimated at over 13,000,000, and includes Masailand and the Kenia Uplands, parts of Somaliland and Gallaland, lakes Rudolf and Stefanie, the Albertine head-waters of the Nile, Lake Albert, part of Albert Edward Nyanza, the northern part of Victoria Nyanza, the countries of Uganda, Kavi-rondo, Unyoro, Ankole, Koko, etc. Great Britain has authority also over the coast islands of Pemba and Zanzibar. In 1888 a charter was granted to a company called the Imperial British East Africa Company, from the initials of whose name the country was for a time called Ibea, and on this body devolved the preliminary work of opening up the whole country. In 1893, however, the company retired from Uganda owing to political and other difficulties, and the protectorate was declared in the following year over that portion of the country. In 1896 this Uganda Protectorate was extended to the neighboring regions of Unyoro, Usoga, Ankole, etc., and the whole district of Uganda is now placed under a commissioner resident at Entebbe, the administrative capital of Uganda. The province of Uganda is recognized as a native kingdom under a "Kabaka." For Europeans and non-natives of the Uganda Protectorate, justice is administered by the British consular courts. Ports have been established at various places, and are garrisoned mainly by Sudanese troops, part of whose duty is to restrain the Unyoro and other peoples from predatory incursions on their neighbor's territory. All the rest of the country, with the exception of the islands of Zanzibar and Pemba, constitutes the East Africa Protectorate, declared in 1895. (See EAST AFRICA PROTECTORATE.) In the interior are many extensive plateaus; the highest mountains of this part of Africa are Mt. Kenia (18,370 feet), Mt. Elgon, and in the extreme west Ruwenzori. The most important rivers are the Nile and its head-waters, with the Tana, Juba, and Sabaki, entering the Indian Ocean. A considerable trade is carried on chiefly with Great Britain and British India. The natives of Uganda and other parts show great skill in various arts, and great

EAST AFRICA — EAST AFRICA PROTECTORATE

capacity for adaption to European conditions and customs. Zanzibar and Pemba are still ruled by a sultan, but form a British protectorate. Some German firms are now in trade here and some trade has been established with Persia and Arabia.

East Africa, German, the German possessions in east Africa, acquired in 1885-90, lying immediately to the south of British East Africa, and having an estimated area of about 400,000 square miles, and estimated population of 4,000,000, of whom 1,000 are Europeans. They are bounded on the north by a line running northwest from the Umba River to the eastern shore of the Victoria Nyanza, and continuing west from this lake to the Congo State. Lake Tanganyika forms the western boundary, and thence a line to Lake Nyassa and the river Rovuma form the southwestern and southern boundaries. In September 1894 it was agreed that the German-Portuguese frontier should follow parallel lat. $10^{\circ} 40'$ S. from the coast to its intersection with the river Rovuma, leaving Kionga and the mouth of the Rovuma to Germany, and Cape Delgado to Portugal. Several stations have been established by the German East Africa Company. A narrow-gauge railway from the coast to lakes Victoria Nyanza and Tanganyika was projected in 1899. The products of the country are coffee, tobacco, cotton, ivory, caoutchouc, and gum. The highest mountain is Kilimanjaro, reaching 19,600 feet. Among the chief rivers are the Rovuma, Rufiji, Kingani, and Pangani, flowing to the Indian Ocean; the Kagera, Shimiyyu, and Ruwara flowing into Victoria Nyanza; and the Malagarazi flowing into Tanganyika. In the north there are several small lakes, and in the southwest the larger salt lake, Rukwa or Hikwa. On the coast the chief towns are Mikindani, Lindi, Dar-es-Salaam, Bagamoyo, Pangani, Wanga, and the English mission station Saadani. Inland there are Mpwapwa, Kanyenye, Tabora (Kazeh), Urambo, and Ujiji, the last named being situated on the shore of Tanganyika. The country is under an imperial governor.

East Africa, Portuguese. The possessions of Portugal, comprising the three provinces of Lourenço Marques, Mozambique, and Zambesi. Its coast line extends south from Cape Delgado, the southern extremity of the coast-line of German East Africa to Kosi Bay, just below Delagoa Bay, at a point separating British from Portuguese territory, as fixed by the Anglo-Portuguese agreement of 1891; the northern boundary is the river Rovuma, running west from Cape Delgado to Lake Nyassa. The frontier between German and Portuguese East Africa runs along parallel lat. $10^{\circ} 40'$ S. from the coast to its intersection with the river Rovuma, leaving the mouth of the Rovuma and Kionga to Germany, and Cape Delgado to Portugal. The eastern boundary is the lake and British Central Africa, or the Nyassa Protectorate down to the junction of the Shiré with the Zambesi; while from that point the British South Africa Company's territory, including Mashonaland and Matabeleland, and the former South African Republic, form the boundary. Its area is about 3,000,000 square miles; population about 1,600,000. The principal exports are oilnuts and seeds, caoutchouc, and ivory. The Mozambique Company administers Sofala and Manica, the Nyassa Com-

pany has jurisdiction in the northern part between Lake Nyassa, the Rovuma, and the Lurio, and there is also a Zambesia Company. There is a railway from Delagoa Bay to Pretoria, and one from Beira to Fort Salisbury in the Transvaal. The coast-lands are low-lying and not very healthy, but in the region of the Namuli Mountains there is one of the finest and most beautiful tracts of country in the whole continent. There are several important rivers, including the Zambesi, Limpopo, Rovuma, Sabi, Pungwe, Lurio, Mtepesi, Lukuga, and many others. The most important towns are Lourenço Marques, Inhambane, Sofala, Beira, Quilimane, Chinde, Mozambique, Ibo, Zumbo, Tete, and Sena. Gold is found in the Manica region on the west, and has been worked by British capitalists.

East Africa Protectorate, British possessions in East Africa, extending about 400 miles along the coast north from Umba, at the mouth of the Umba River. The south boundary runs from Umba in a northwest direction to the intersection of the Victoria Nyanza with the first parallel of N. lat., skirts the north shore of the lake, and thence west to the boundary of the Congo Free State. The river Juba begins the north boundary, which from the intersection of the river with the 6th parallel of N. lat. runs to the 35th meridian E. lon., and follows that to its intersection with the Blue Nile; the Congo Free State and the west water-shed of the basin of the Upper Nile forming the west boundary. The total area is about 300,000 square miles, embracing a great part of Somaliland, the Equatorial province, Usoga, Unyoro, etc. It is subdivided so as to consist of seven provinces and a tract of unorganized territory in the northwest. The provinces are under a sub-commission, and are divided into districts and sub-districts. Nandi and Kericho were formerly under the eastern province of Uganda, but 1 April 1902, they were transferred to the East Africa Protectorate. Mombasa is the largest town and the capital of the whole Protectorate. Pop. of Mombasa 27,000. The population of the Protectorate is estimated at 4,000,000. The Imperial East Africa Company opened up the country, having in 1888 obtained a concession of territory from the Sultan of Zanzibar and a charter from the British government. An arrangement for buying them out, was, however, made in 1895. The chief ports are Mombasa, the capital, Lamu, Umba, and Kismayu.

The prevailing religious belief is paganism of some form, but a large number are Mohammedans. A number of Christian missions have been established, and elementary schools founded. Legislation is by ordinances made by the commissioner, the codes of India being followed as far as applicable. The higher courts are at Zanzibar and Mombasa. Slavery is legal on the 10-mile coast strip, but nowhere else under the Protectorate. The principal exports are ivory, rubber, grain, cattle, hides, horns, gum-opal, and fruits. The principal imports are: Manchester and Bombay goods, brass, wire, beads, and some provisions. Trade is chiefly under the control of the East Indian merchants. In 1901 the railroad from Mombasa to Kisumu on Lake Victoria was completed, and other railroads are in process of construction. Post-offices, telegraph lines and other public im-

EAST ANGLIA—EAST INDIA COMPANIES

provements have been introduced and are being extended. See EAST AFRICA, BRITISH.

East Anglia, an ancient kingdom of England, its territory corresponding to what is now Norfolk and Suffolk counties. Redwald was its first historical king (593-615).

East Aurora, N. Y., village in Erie County, on the Western N. Y. & P. R.R., 18 miles southeast of Buffalo. The place is noted as the home of the colony of Roycrofters. (See ROYCROFTERS). It is a residential suburb of Buffalo.

East Cape, the name of the southeastern extremity of New Guinea, in Goschen Strait, and of the most easterly headlands of Madagascar; also on the North Island of New Zealand; also in Siberia, on Bering Strait, in lon. 169° 38' W., in the eastern extremity of Asia. The latter is a bold, rocky promontory, almost cut off from the mainland by swamps and shallow lakes. On the north side is a village, Uéde, of less than 100 huts, with a population of about 260.

East Greenwich, R. I., town, county-seat of Kent County; on Greenwich Bay, and the New York, N. H. & H. R.R. The manufactories are cotton and yarn mills; it has also a large cotton bleachery. Pop. 2,825.

East Hampton, N. Y., town in Suffolk County, in the eastern part of Long Island; on the Long Island R.R., about 122 miles east of New York. The first settlement was made in 1649 and the place was considered as belonging to Connecticut from 1657 to 1664 when it came under the jurisdiction of New York. It was the home of John Howard Payne (q.v.). Pop. 3,800. Consult: Gardner, 'Records of East Hampton'; Hedges, 'History of the Town of East Hampton.'

East Hartford, Conn., town in Hartford County, on the New York, N. H. & H. R.R. The railroad shops and paper-mills give employment to a number of people. Large quantities of tobacco and garden vegetables are raised on the surrounding farms. Pop. 6,500.

East Humboldt Mountains, a range of mountains in Nevada, principally in Elko County. Fremont's Pass is in these mountains. Their slopes have more and larger trees than some of the other mountain ranges in the vicinity.

East India Companies, the various European trading companies chartered by their respective governments for the control of their trade in India and the adjacent countries and islands. From an early period, the Italian republics had established a flourishing trade with these eastern dominions, which was interrupted by the Moslem conquest of Egypt and Constantinople, and the establishment of Turkish rule in Africa and Europe. Under these circumstances arose that spirit of maritime exploration in the 15th century for the discovery of a new passage to the Indies which resulted in the discovery of America by Columbus while seeking a westward route, and in Vasco da Gama sailing around the Cape of Good Hope and reaching the Malabar coast in 1498. This latter discovery gave a new impulse and direction to commercial enterprise and in nearly all the leading nations of Europe, steps were taken to participate in the advantages prospectively revealed in the opening up of this new ocean highway. The 16th century was marked by the Portuguese establishing themselves in India; by English efforts to discover over-

land and northern passages to India, which while fruitless in the latter direction gave rise to commercial relations with the northern coast of Russia; by the union of Portugal and Spain in 1580, and the war with England which closed the Spanish-Portuguese avenues for Indian produce to that country; and by the revolt of the Netherlands against Spanish dominion which gave a parallel check to the Dutch Indian trade. These two latter events compelled Holland and England to seek direct communication with India; in 1582, a Capt. Stephens was the first Englishman to reach India via the Cape of Good Hope, and in 1586 Sir Francis Drake and Thomas Cavendish followed by way of Cape Horn. In the following decade the great historical commercial corporations known as the Dutch and the English East India companies, were organized, and later were followed by Danish, French and Swedish enterprises.

The Portuguese East India Company was organized in 1587, when, owing to laxity in the official management of the trade developed since 1498, it was entrusted to a company of Portuguese merchants in consideration of an annual payment. The company had a turbulent existence, chiefly of conquest by the Dutch until its dissolution in 1640, since when the unimportant Portuguese settlements have been under crown administration.

The Dutch East India Company formed at Amsterdam in 1595 as "a company for remote parts," in 1602 amalgamated with several minor companies and received a charter conferring the exclusive privilege of trade to the East Indies for 21 years, with the necessary civil and military powers. It had a wonderfully prosperous career and its charter was extended to 1644, when French and English competition had made itself so felt that the Dutch company had difficulty in raising the government subsidy for a 21 years renewal of the charter.

The peace of Westphalia in 1648, ensuring the independence of Holland, inaugurated a new era of prosperity; the company colonized the Cape of Good Hope between 1650 and 1670; in 1658 captured Ceylon from the Portuguese; the same year took Formosa, from which they were driven three years later by a Chinese adventurer; in 1663 obtained possession of the chief Portuguese settlements along the Malabar coast, and in 1666 monopolized the spice trade by the capture of Macassar. Their charter was renewed periodically until 1776; in 1781 owing to the expenses of the prolonged struggle against English encroachment, the company had to be assisted with a government loan, and in 1795 the proclamation of the Batavian republic terminated its existence; in 1798 the mother-country assuming the administration of the company's former possessions.

The English East India Company formed in 1599 and chartered by Queen Elizabeth in 1600, under the title of the "Governor and Company of Merchants of London trading with the East Indies," was the most important, commercially and historically of the East India companies. The trading limits assigned by the charter for 15 years were "all the islands, ports, havens, cities, creeks, towns and places of Asia, Africa, and America, or any of them, beyond the Cape of Bona Esperanza to the Straits of Magellan, with the exception of such places as are already in possession of any Christian prince in league

EAST INDIAN MANUFACTURES.

EAST INDIA HOUSE—EAST LIVERPOOL

or amity with the British crown who shall refuse his consent to such trade." The company comprised 125 stockholders, including a governor and 24 directors elected annually to supervise the company's business. The early voyages of Lancaster, Beal, Best and others resulted in large profits; in valuable commercial treaties being entered into with native princes; and in English prestige being considerably enhanced throughout the Orient by naval and political successes over the Portuguese. The establishment of factories in various stations, however, excited the jealousy of the Dutch, who in 1623 massacred the members of the English factory at Amboyna, an atrocity for which Cromwell in 1654 compelled the Dutch government to cede an island and to pay a sum of \$1,500,000 as compensation to the victims' families. This incident inaugurated the struggle which resulted in the loss to the Dutch of all their possessions on the Indian peninsula. With periodical renewals of its charter, the company, overcoming all rivalry and opposition, maintained its position. From 1745 to 1761 it was engaged in a crucial fight throughout the Carnatic for supremacy with the French company established in 1664, and which under La Bourdonnais and Dupleix had obtained almost paramount power in India; Clive (q.v.) brought it safely through the struggle. It was with reluctance, however, that the company accepted the position which their victories over the French and the native states was forcing upon them of territorial magnates, and unconsciously, of founders of the British empire in India; especially when their growing political importance inspired the home government with a desire to control their company.

In 1766 the right of the company to acquire territorial possessions formed a subject of inquiry in the British Parliament; and a year later a resolution of the proprietors to raise their dividend to 12½ per cent was vetoed. The question of the political rights of the company being thus raised, the British ministry acted on their view of it by sending a crown plenipotentiary to India, and after a protracted struggle, a regulating act was passed in 1773 remodeling the powers of the company and placing it under the control of Parliament. The constitution of the councils of the presidencies was regulated and their superintendence assigned to a crown official, Warren Hastings (q.v.) being appointed first governor-general. A further act introduced by Pitt in 1784 modified the political power of the company by a board of control, to superintend, direct, and control all acts, operations, and concerns relating to the civil and military government or revenues of India. From this time the political power of the company was little more than nominal, the right of nominating its officials still remained with the directors, but the absolute right of recall was vested in the crown. The company's charter was renewed with a few changes in 1793 and subsequently at intervals of 20 years; in 1813 they lost the monopoly of the Indian trade, which under certain restrictions was thrown open to all British subjects; their right of exclusive trade was restricted to China, but in 1833 this monopoly was also abolished. Their charter was renewed for the last time in 1853; the Indian mutiny, 1857-8, discredited the company's administration, and in 1858 a proclamation at Calcutta announced that Queen Victoria had assumed the government of

India. The company continued to receive and distribute the dividends guaranteed by the government until the East India Stock Redemption Act became operative in 1874 when the company was dissolved.

The Danish East India Company, founded in 1618, dissolved in 1634, reconstituted in 1670, again dissolved in 1729, was succeeded in 1732 by the Danish Asiatic Company. This company had a prosperous career until the war between Great Britain and Denmark in 1801, when its trade declined and ended with the cession of Tranquebar and Serampore to Great Britain in 1845.

The French East India Company, known as "La Compagnie des Indes Orientales," was founded in 1664 by Colbert, minister to Louis XIV. It had extensive privileges, and in 1675 made a settlement at Surat, and in the following year at Pondicherry. It had a long and prosperous career, notwithstanding the loss of trading privileges at various periods and its connection with the Mississippi Bubble (q.v.). It reached the height of its prosperity under Dupleix and La Bourdonnais (q.v.), extending its operations until the Deccan and the Carnatic were practically under French control, when antagonism with the English under Clive, the recall of Dupleix, and practical abandonment by the French government, led to the dissolution of the company by royal decree in 1769.

The Swedish East India Company, founded at Gothenburg in 1741, was reorganized in 1806. Consult: Bruce, 'Annals of the East India Company' (1810); Stevens, 'Dawn of British Trade to the East Indies' (1886); Castonnet des Fosses, 'L'Inde Française avant Dupleix' (1887).

East India House, the home of the East India Company in Leadenhall Street, London, well known during the 17th century. Charles Lamb, James Mill, and John Stuart Mill had clerkships at East India House. See EAST INDIA COMPANY.

East Indies, a name given to what was once called the peninsula of Hindustan and Farther India, and includes also the Malay Archipelago. This name was given to distinguish the Indies reached by sailing east from the Indies (West Indies) reached by sailing west.

East Lake, Ala., town in Jefferson County, about seven miles northeast of Birmingham. Howard College was established here in 1841, under the auspices of the Baptist Church. In 1902 there were in this college 10 teachers and 120 students. Pop. 3,150.

East Liverpool, Ohio, city in Columbiana County; on the Ohio River, and on the Pennsylvania R.R., 45 miles west of Pittsburgh. It has freight packet connections with all important Ohio river ports, extensive china, porcelain, earthenware, terra cotta and glass works, foundries, and machine shops. It has the largest pottery works in the United States, natural gas furnishes light and fuel, and the water-works are owned by the city. It has good schools, one business college, three national banks, and daily and weekly newspapers. Under the charter of 1882 the government is administered by a mayor and city council elected biennially. Pop. (1900) 16,485.

EAST LYNNE—EASTER

East Lynne, a novel by Mrs. Henry Wood, which appeared in 1861. It takes its name from the ancestral home of the heroine, Lady Isabel Vane. Several years after marriage, mistakenly doubting her husband's fidelity, she leaves him for another, but later returns in disguise as nurse to her own children, and on her death-bed receives his forgiveness. Although 'East Lynne' has little literary merit, it secured immediate popularity, has been through many editions on two continents, and proved extremely successful as an emotional drama.

East Main, a region of the Dominion of Canada which formerly belonged to the Hudson Bay Territory, but which is now in the Ungava District. It is a bleak and desolate country, yielding little to commerce but fish oil and a few furs.

East Orange, N. J., city in Essex County, on the main line of the Lackawanna R.R., and on a branch of the Erie R.R.; about 12 miles west of New York. It is a residential city, its population being made up largely of people who do business in New York and Newark. The city contains many handsome churches, and private residences, a public library, high and graded schools, a national bank, and weekly newspaper. Pop. (1900) 21,506.

East Providence, R. I., a town in Providence County, on the Seekonk River, and on the New York, New Haven & Hartford R.R. It lies directly opposite the city of Providence. East Providence and the town of Seekonk, Mass., were once a part of the old town of Rehoboth. The town has extensive chemical works, electrical and wire works, bleacheries, linen manufactures, and other industries. The government is administered by a town council, which elects a majority of the local officials. The council members are elected annually by popular vote. The town was incorporated in 1862. Pop. (1890) 8,422; (1900) 12,139.

East River, the strait connecting Long Island Sound and New York harbor, separating the boroughs of Manhattan and Brooklyn. It is about 10 miles long, and is navigable by the largest ships.

East River Bridge. See WILLIAMSBURG BRIDGE.

East Saginaw, Mich. See SAGINAW.

East Saint Louis, Ill., city in Saint Clair County on the Mississippi River and on the Baltimore & Ohio, Chicago, B. & O., the Illinois and other railroads, opposite Saint Louis, Mo., and connected with it by the Eads Bridge. This is an important railroad and industrial center, the converging point of all the railways, 22 in number, entering Saint Louis, Mo.; it is also the great livestock distributing center of the United States, there being large stock yards here, numerous packing-houses and kindred establishments. It also has the largest and most important horse and mule market in the world. As a manufacturing city it contains rolling mills, steel plants, iron works, locomotive and machine shops, glass factories, sugar mills, grain elevators, flour mills and manufactories of various wood products. Seven miles distant are the great fields of Illinois. In public buildings the City Hall, High School, Public Library, Roman Catholic Academy, and Business College are

notable examples. There are three national banks, and one daily and four weekly newspapers. The city has electric light, gas and water works plants and electric street car service, municipal and suburban. East Saint Louis was incorporated as a village in 1861, and as a city in 1865. It expended over \$5,000,000 for public improvements from 1890 to 1900. The city is governed by a mayor and city council, elected biennially. The minor municipal officials are likewise elected by the people. Pop. (1870) 5,664; (1880) 9,532; (1890) 15,000; (1900) 29,655; (1903) estimated 40,000.

JAMES W. KIRK,
Editor East Saint Louis Journal.

East/cheap, at one time a large market in the east of London. It occupied what is now Billingsgate and Leadenhall market. Several streets or roads converged at the great square, then called Eastcheap. Two of those highways were the old Roman roads which extended northeast and northwest out of the city. Some of the old taverns, notably "Boar's Head," mentioned by Shakespeare and others of the English writers, were at Eastcheap. At the north end of London Bridge there is now a small street called Eastcheap.

Easter, the festival commemorative of the resurrection of Jesus Christ, is called in the Greek and Latin and in the languages derived from them *Pascha*, *Pasch*, *Pasqua*, *Pascua*, *Pâques*, etc., from the Chaldee word *Pascha*, the equivalent of the Hebrew *Pesach*: and that name recalls the act of the Destroying Angel in "passing over" the households of the Hebrews when he smote the Egyptians (Exod. xii.). In languages of Germanic origin the festival has a name *Ostara*, derived from the goddess of spring, in Teutonic mythology. Besides being commemorative of the resurrection of Jesus Christ the Easter festival is a memorial of the Christian passover—of the atonement wrought by the death of Christ upon the cross. At first the Christian passover was celebrated on the same day as the Hebrew, the 14th day of the month Nisan. But before long in the Church of Rome and in other churches of the Latin world, the observance was transferred to the Sunday next after the 14th Nisan; this doubtless primarily to make the difference between Judaism and Christianity.

The churches of Asia and some in the West which were founded by missionaries from the East, were slow to adopt the usage of Rome, and the diversity of usage gave rise to no little controversy; the westerns taunting the easterns with subservience to Judaic custom, and the easterns accusing the westerns of innovation and departure from the ways of Jesus Christ and his apostles. It was not till the year 235 that a general law of the Church was enacted at the Council of Nice prescribing for the universal Church a day for this solemnity. To the bishops of Alexandria was committed in permanence the task of computing for all the churches the time of Easter, that city being the metropolis of science in those times. But the Alexandrine Paschal Cycles fixing the date of Easter for a long course of years were unsatisfactory, being both obscure and incorrect, and hence were not accepted generally; and as a result, in 444, Rome observed 26 March as Easter Day, while Alexandria observed 23 April; and earlier,

EASTER ISLAND — EASTERN QUESTION

in 387 Easter Day in Gaul was 21 March, in Italy 18 April, in Egypt 25 April. The churches in Great Britain and in Ireland were, like those of Gaul and Egypt, at variance with Rome, and from that circumstance has been rashly inferred an Oriental origin of the Gaelic, Scotie, and pre-Saxon British churches: in fact those churches were but adhering to an antiquated rule which they had received from Rome, but which Rome herself had abandoned having reformed her calendar. It was in 669 that Theodore, Archbishop of Canterbury, established the reformed Roman calendar in England. The movable feasts of the Roman Catholic and the Anglican churches are determined by the day of the month upon which Easter Day falls. (See CALENDAR.) The way by which Easter Day is now determined is that of the first Sunday after the paschal full moon (14th day of the calendar moon, or the full moon which happens upon or next after the 21st of March). If the full moon happens upon a Sunday then Easter Day is the first Sunday following.

Easter Island, an island in the South Pacific Ocean, lon. 109° 17' W.; lat. 27° 6' S. The surface is hilly and the soil fertile; yams and sweet potatoes are the principal crops. A number of remarkable sculptures have been found on this island, gigantic stone images. In 1888 Chile took possession of the island, and has since made it a penal settlement. Pop. about 1,500.

Eastern Empire, the ancient empire lasting from 394 A.D. to 1453 A.D., which had its metropolis at Constantinople as distinguished from the western empire with its capital at Rome. It is known also as the Byzantine empire, the Roman empire of the East, and the Greek empire. See BYZANTINE EMPIRE.

Eastern Question, The, the name originally given to the diplomatic and national interests affected by the gradual retrocession of the Turkish empire in Europe, and the problem of disposing of the territory thus left, or presumably to be left. Bulgaria, Rumania, Servia, and Greece are the new states which have naturally arisen on the withdrawal of the Turkish power, and their history in connection with the respective policies of England, France, Austria, and Russia toward them is the history of the phases of the "Eastern Question" so far. The Crimean war of 1854-6, with the Treaty of Paris which followed; the Russo-Turkish war of 1877-8, with the Treaty of Berlin; and the Greco-Turkish war of 1897, are among the notable events connected with this subject. British diplomacy on this question has mainly aimed at checking the attempts of Russia to extend her empire and strengthen her strategic position by the absorption of part or all of the territory now belonging to the decaying Turkish empire. Of late years, however, the meaning of the phrase has been much extended, and may now be said to embrace the problem of preventing the aggression of Russia, either in Europe or Asia, from becoming a menace to the authority or commerce of Great Britain. The Russo-Chinese phase of the subject is the most recent one, and arose after the Japanese triumph of 1895 had shown the essential military, naval, and administrative weakness of China. The Turkish atrocities in Armenia showed how jeal-

ous of each other the Great Powers are in connection with these questions.

Whenever any phase of the Eastern question is reopened, all the world is concerned, and Russia becomes particularly interested because the question affects her route to the sea, and what is more her relations with England, the United States, and others of the Great Powers. Austria is concerned because it affects her prospects among the Balkan states. France is concerned because it affects her commercial ambitions in the Orient, her claims in Africa, her route to the East, and the interests of Russia, her great ally. Germany is concerned because of her relations to Russia and France. England is concerned because of Russia and her own life-and-death interests as the maintainer of a world empire in the Suez canal. All the colonial interests in southern Asia and in Africa are concerned. International politics all over the world, whatever the apparent issue and habitat, are resolvable into some form of the Eastern question and stand in sensitive connection with this great political storm centre of the world, the *Ægean* and the Bosphorus. America is also concerned with the Eastern question in its larger bearings.

The struggle between Occidentalism and Orientalism, and who is to lead as champion of the former, constitutes what may be called the greater Eastern question. When one crosses the *Ægean*, which is at one part only 100 miles wide, or crosses the Bosphorus which is merely a broad river, deep and rich, flowing down out of the Black Sea, and comes to the shores of Asia Minor, one becomes aware that he has passed out of one world into another world. He has passed out of the Occident into the Orient. The contrast between them, one cannot mistake. The West is full of creation, progress, restlessness, achievement, failure, disappointment, exultation; the East abounds in quietism, resignation, and blissful stagnation. Those are the great outlines of the difference, but they are outlines which force an absolute frontier through life, through the nations of men. Greece stands there at the gateway, and whatever comes from Asia to Europe comes through it. This is the lesson of early European civilization; will, force, empire came down from the North; refinement and civilization moved back in the reverse of their track. The reaction from Alexander's onslaught on the East came late, but it came strong. It came in the form of Islam. Mohammedanism is inspired Orientalism. On came Islam in a mighty tide, seeming, as it were, to have gathered force from the strong impact of Alexander's onslaught a thousand years before, as well as from having been pent up under that tremendous pressure which the Roman empire urged on it for so long. It came on in a terrible tidal wave, swept across northern Africa, across Spain, half across France, all over Asia Minor, up into the map of Europe to the gates of Vienna, and buried old Greece under a terrible slavery for centuries.

That was the reverse tide. The reaction set in long ago. Spain was long since cleansed. The Balkan states have been freed; Greece since the twenties has been free. The Sick Man of Constantinople lingers there by slender footing. He stays where he is by the sufferance of the Powers, or rather as the Persian empire stood — namely, so long as the Greeks could

EASTERN QUESTION

not agree among themselves about the leadership of Occidentalism. That is what we are waiting for now. Who is to be the leader, who is to be the champion of Occidentalism in the 20th century? This is the practical form in which the greater Eastern question is stated to us now.

First of all, Turkey commands our attention. She still sits at the old-time gate by the Bosphorus, and her guns at the fort at Kum Kaleh still command the entrance to the Dardanelles. As a state, Turkey is a heterogeneous assemblage of people under the absolute sway of the sultan. It is a government lacking altogether a sense for the right of a community to choose concerning its own government. It thoroughly represents the Oriental idea whereby government is transcendent, a power above and outside the people, and not imminent, a power within the people. Herein lies the application of the Occidental-Oriental antithesis to political institutions. Turkey, though thoroughly Oriental in its political ideas, maintains its place on Occidental soil because the forces of Occidentalism cannot agree among themselves as to leadership.

Among the various peoples and races whom the fate of history has assigned to Turkish sway are the Armenians. Though their proper district is a province in northeastern Asia Minor, they are found scattered all through the Orient, nearly a quarter of a million of them living in Constantinople alone, and constituting nearly a quarter of its population. The Turkish empire, however, in its lack of sense for what we call distributed government, has no place for their individuality in its scheme. They are to the Turks, as far as they possess individuality and the tendency to use it, simply a plague spot in the empire. Crete is another plague spot on the Turkish map. The population of the island is essentially Greek. Of the quarter million inhabiting it there are perhaps 50,000 Mussulmans, but all speak Greek. Since the 17th century it has been in the hands of Turkey. The insurrection of 1866-8 stirred profoundly the sympathy of Christian people, but the governments of Europe as represented by the Powers insisted, even with a severe menace to Greece, in maintaining the *status quo* of Turkish possession. Repeated insurrections have taken place, notably those of 1891 and 1896; indeed the island has been in a perpetual state of unrest during most of the past century. Various promises of reformed administration have been at different times made by Turkey, but no satisfactory government has resulted. Turkey is unable to administer government. To the Turk the Greek is what the Armenian is—a nuisance. Similar conditions exist in the coast districts of Macedonia and in Epirus, though in the latter the discontent is not so acute or so well formulated. In both, the prevailing population is Greek, and the language, even of the Mussulman, in the latter, Greek. The unnaturalness of the situation teaches that postponement of a settlement can only be temporary. The greatest apprehension attaches to any consideration of any change whatsoever in the existing status. The moment the dismemberment of the Turkish empire in Europe begins, a long list of long-fled claims must be considered. They are unwilling to recognize preferred creditors. Crete, too, lies on

the route to the Suez Canal. It is possible there are other ambitions than those of Greece.

The Greeks are a people that must be reckoned with in the future settlement of Eastern questions. Commercial interests around the entire line of the Ægean are largely in Greek hands. More than one fourth of the population of Constantinople itself is Greek. Now that the Greek state has been created, it constitutes a rendezvous and point *d'appui* for the sentiment of nationality among the scattered millions of Greek blood and language. The Greek nation itself is bankrupt. The land offers no great hope of greatness under present day conditions. It is not suited to agriculture. It has neither water power, minerals in abundance, nor coal supply. But it has an energetic, active, optimistic, though restless and impulsive and, as yet, half-educated people. They are abstemious and thrifty. In foreign lands they accumulate wealth. They are profoundly patriotic. All the traditions of their glorious past are molded into the substance of their modern national life. They are thorough Occidentals, and their antagonism to Orientalism, both in spirit and in the concrete forms of Turkey and Turks, is thorough. The fight with them is on and it will last to the death, because it is grounded in an indestructible difference of thought, mood, and character.

Among the small states of the Balkan peninsula, Bulgaria is now the one developing most rapidly in strength and prestige. She has become the rival of Greece among the lesser states. They both look with greedy eyes toward Macedonia, whose inland population is Slavic, but whose coast population is Greek. Bulgaria is now reconciled with Servia and Montenegro, and by the formal act of allowing the baptism of the crown prince into the eastern Church sealed her acceptance of Russia's headship. As the Prince of Bulgaria said on the occasion of the baptism, "I turn my face toward the East." All the Balkan states, with the exception of Rumania, have, therefore, now virtually accepted the suzerainty of Russia. Rumania, in her isolation, has re-established friendly relations with Greece.

Austria of all the great powers fears most acutely the reopening of the Eastern question. The Slavic-Balkan states, consolidated now under Russia's protection, interpose between her and the Ægean a solid wall. It has been her eager ambition to secure a port on the Ægean (Salonica), and a right of way to it. She has now no chance. Any dislodgment of conditions in the Orient at this time could bring her no good, and would produce only relative injury.

Germany utilizes her influence as a power apparently in Russia's interest, so far as the Eastern question is concerned. She stands between France and Russia. If both are hostile she is lost. It is, therefore, her policy to trade the interests of the East for Russian favors. The failure of England's effort a year ago to extort reforms from the sultan was due more or less directly to Germany's duplicity. Germany played secretly Russia's game, with the result that Turkey became a province of Russia. This brings us to Russia.

Russia seems to-day the destined possessor. She was once at its gates, and only England's intervention kept her out. England's prestige in the Orient has suffered severe loss by the

collapse of her Armenian policy. Russia has made steady gains. The Slavic-Balkan states are her children, first by natal claims, for she freed them; now by formal diplomatic recognition. They are closing in steadily about Constantinople. Turkey herself has become virtually a Russian province. Russia has besides a natural geographic claim. So great a power as that cannot be cooped up away from the seaboard. The Bosphorus is her natural exit. She is a great world-power, bestriding Europe and Asia. France and China, as well as Turkey, are her allies, almost her provinces. She is immensely strong in her position for diplomatic aggression, because her whole power can be swung by a single hand. Safe in her position, unmenaced from the rear, she has only to bide her time, and as occasion offers to push forward. She is strong furthermore in a certain sympathy her semi-barbarism has with that of the border peoples of Asia. The peoples of the East always prefer the Russian to the Englishman. Russian diplomacy understands the Oriental use of language. Language is used by the Oriental for the purpose of producing kindly feeling or inducing another mortal to see things as you do, but certainly not for the purpose of reporting on objective verities. It is a mechanism for reporting on the greater subjective verities. The Englishman is not liked, though England is everywhere highly respected, feared, and trusted.

Constantinople has been for the last dozen years systematically fortified against the English but not against Russia. A Russian army can enter Constantinople at will. When the question of forcing the Dardanelles with an English fleet was agitated, the English naval authorities estimated that of the 19 ships lying at Salonica, 6 must be sacrificed to do it. The cards have been stacked for Russia. It looks to-day as if the ultimate occupation of Constantinople by Russia were a foregone conclusion. The opening of the Suez Canal has changed things, and as if by jealous interposition of geographic fate, drawn the issue back to the old fighting ground in the eastern Mediterranean. England must, if she is to hold India and Australia, control the Suez Canal and its approaches. England stands in political isolation, a grand isolation, strong not by alliances, but in and by her own intelligence, rectitude, and Anglo-Saxon grit. Within the last five years England has made up her mind that she must be strong enough, if necessary, to face all Europe single-handed. Within that time her navy has been doubled in strength. She is preparing for an inevitable conflict. The conflict concerns this question: who is to be the leader and champion of Occidentalism in the 20th century? Shall it be the Anglo-Saxon or the Slav?

The world is arraying itself in two great camps. Russia spans the north from China to France, and guiding the foreign policy of Germany rules in the last decision northern Asia and all Europe, except England and Italy. England spans the seas and holds in a mysterious bond of common interest and guaranteed justice the diverse elements of her world-empire. Russia's strength has been possibly greatly overestimated. The bonds which hold her empire together might weaken under the testing of adversity. Those which bind the British empire together would strengthen. The financial difficulties which Russia would face in the event

of a great struggle are an element of great weakness in her situation. England's resources are unlimited, infinitely varied and self-supplied. The power of the British empire as it is now organized has never been called to the test. It is no longer a question merely who shall hold Constantinople or who shall control the Suez Canal, who shall command the pass of Thermopylæ, or who shall control the oracle of Delphi. It is a larger question, and it concerns larger interests. It concerns the habitable globe.

BENJAMIN IDE WHEELER,
President University of California.

Eastern Rite, Churches of, a name given to various bodies of Eastern Christians who are members of the Roman Catholic Church, but who have been permitted to retain many of their ancient customs, which differ from those in general use throughout the world. The Armenians, Coptics, Greeks, Maronites, and some others belong to the Eastern Rite. They differ from the Latin Church in nothing doctrinal, only in some matters of discipline. Their liturgy is in the language first used by their bishops and priests, and in no case is the Mass said in their vernacular of to-day. For instance, the Syrians use now the Arabic language (in some places modified) but the Maronite liturgy is in the old Syriac language, as used at the time of Christ. (See MARONITES.) They differ as to the manner of administering communion; some using for consecration only the leavened bread, others only the unleavened, and some giving communion to the laity under the form of both bread and wine, others using only one of the species as in churches of the Latin Rite. The discipline of marriage for the clergy differs from the Latin Church. Candidates for the priesthood may marry before becoming deacons, not after. All points of difference between the Eastern and Latin Rites are of discipline, not of faith.

Eastern Shore, a name given to all that part of Maryland lying east of Chesapeake Bay, and also the counties of Accomac and Northampton in Virginia. Delaware is sometimes included in the Eastern Shore. The country is noted for its fruit and for its mild climate. Great quantities of oysters are taken annually from the waters of the Eastern Shore lands.

Eastern Star, Order of the, a secret society composed exclusively of Freemasons in good standing, and their wives, mothers, sisters, and daughters, and the widows of Freemasons. The order originated in New York 1868. In 1901 there were 28 grand chapters in as many States, and nearly 100,000 members. Its rites and services are conducted with all the impressive se-

EASTERN STATES—EASTMAN

crecy peculiar to Freemasonry. A five-pointed star, between whose points the word "Fatal" is inscribed, is the badge of the order.

Eastern States, in popular parlance, the six New England States—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; in the Mississippi valley the inhabitants refer to the Eastern States as that section lying east of the Alleghany Mountains.

Easthampton, Mass., town in Hampshire County; on the New York, N. H. & H., and the Baltimore & M. R.R.'s; 12 miles northwest of Springfield. The chief manufactures are cotton goods, yarns, buttons, shoe-web, rubber and elastic goods. Williston Seminary, a preparatory school for boys, is located here. Easthampton was settled in 1665; and on 13 May 1704 an Indian attack upon the settlement resulted in 19 killed and much loss of property. Three villages are included in the town of Easthampton. Pop. 5,700.

Eastlake, Sir Charles Lock, English artist: b. Plymouth 17 Nov. 1793; d. Pisa, Italy, 23 Dec. 1865. He entered the schools of the Royal Academy, where Haydon supervised his education. In 1816 he went to Italy, and for 14 years his home was at Rome, his Italian life being broken by visits to England and Greece. Pictures of banditti and other subjects exhibited in England procured him the associateship of the Academy in 1827. 'Pilgrims Arriving in Sight of Rome' (1828) became so popular that the artist became tired of repeating it in different versions. In 1830 he was made an R.A., his diploma picture being 'Hagar and Ishmael.' 'Escape of Francesco Carrara' (1834); 'Gaston de Foix' (1838); 'Christ Blessing Little Children' (1839); and 'Christ Weeping Over Jerusalem' (1841), were next among his noteworthy productions. 'Helena' (1849); 'Ippolita Torelli' (1851); 'Violante' (1853); may also be mentioned. He translated Goethe's 'Theory of Colors' (1840), and published in 1847 'Materials for a History of Oil-painting.' He became president of the Royal Academy in 1850, being knighted on the occasion; was keeper of the National Gallery in 1843-7, and director of the same institution from 1855 onward.

Eastlake, Charles Locke, English art critic: b. Plymouth, England. He studied in the Royal Academy schools, but subsequently devoted himself to literary work and design, and was keeper and secretary of the National Gallery 1878-98. He has published: 'History of the Gothic Revival in England' (1871); 'Hints on Household Taste' (4th ed. 1874), a book which exerted much influence in its day; 'Lectures on Decorative Art and Art Workmanship' (1876); 'The Present Condition of Industrial Art' (1877); 'Our Square and Circle' (1895); 'Pictures at the National Gallery' (1898).

Eastman, Charles Alexander, American homœopathic physician, and author: b. Redwood Falls, Minn., 1858. His father was a Santee-Sioux Indian, Many Lightnings (Jacob Eastman), and his mother a half-breed Sioux, Nancy Eastman. He was graduated at Dartmouth College 1887, and at the Boston University School of Medicine 1890. He married the poetess, Elaine Goodale, 1891. He served as government physician at Pine Ridge Agency 1890-3, being Indian secretary of the Y. M. C. A. 1894-7. He

acted as attorney for the Santee Sioux at Washington 1897-1900, later becoming government physician at Crow Creek, South Dakota. He published 'An Indian Boyhood: or Recollections of a Wild Life' (1901).

Eastman, Charles Gamage, American poet: b. Fryeburg, Me., 1 June 1816; d. Burlington, Vt., 1861. He published (1848) a volume of 'Poems' descriptive of rural life in New England, and edited the Vermont *Patriot* at Montpelier from 1846 until his death.

Eastman, Charles Rochester, American palæontologist: b. Cedar Rapids, Iowa, 5 June 1868. He was graduated at Harvard University in 1890. Subsequently he served on the United States and Iowa State geological surveys; and was an instructor in geology and palæontology in Harvard and Radcliffe colleges. He afterward took charge of the department of vertebrate palæontology in the Agassiz museum at Harvard. He published an English translation of Von Zittel's 'Palæontology' (1901). In 1901 he was tried for the murder of his brother-in-law, and acquitted.

Eastman, George, American inventor: b. Waterville, Oneida County, N. Y., 12 July 1854. As an amateur photographer in Rochester, N. Y., he turned his attention to the production of dry plates, which achieved an instantaneous success. In 1881 the Eastman Dry Plate Company was organized, which developed later into the Eastman Kodak Company. Eastman companies have also been established in London, Paris, Berlin, and elsewhere, and the business has now reached vast proportions.

Eastman, Harvey Gridley, American educator: b. Marshall, N. Y., 1832; d. 1878. In 1859 he founded the Eastman National Business School at Poughkeepsie, N. Y.

Eastman, John Robie, American astronomer: b. Andover, N. H., 29 July 1836. He was graduated at Dartmouth College in 1862; and became assistant in the United States Naval Observatory. In 1865 he was appointed professor of mathematics in the navy. He has been a member of several astronomical expeditions in the United States, and accompanied one to Sicily in 1870. Most of his observations, computations, and researches appear in the annual volumes of the 'Naval Observatory,' which, in 1872-82, were edited by him.

Eastman, Julia Arabella, American writer for juveniles: b. Fulton, N. Y., 17 July 1837. Among her writings are: 'Short Comings and Long Goings' (1869); 'Beulah Romney' (1871); and 'Young Rick' (1875).

Eastman, Joseph, American physician: b. Bleeker Mountains, Fulton County, N. Y., 1842. He learned blacksmithing, served for a time as a private in the Federal army during the Civil War, subsequently studied medicine, and has long been prominent as a physician in Indianapolis, his specialty being abdominal and pelvic surgery.

Eastman, Mary Henderson, American prose writer: b. Warrenton, Va., 1818. She has published: 'Dacotah or Life and Legends of the Sioux' (1849); 'Romance of Indian Life' (1852); 'Tales of Fashionable Life' (1856); and many stories and sketches.

EASTON—EATON

Easton, Nicholas, American colonial statesman: b. Wales 1593; d. Newport, R. I., 15 Aug. 1675. Emigrating to America in 1634 he was the first settler in Agawam, now Newbury, Mass., 1635. He built the first English house in Hampton, N. H., 1638, and the first one on the site of Newport, R. I., 1639, and was elected president of Providence Plantations 1649 and 1654. He was deputy-governor of Rhode Island for four years, and governor 1672-5.

Easton, ēs'tōn, Md., town, county-seat of Talbot County; on the Philadelphia, W. & B., and the Baltimore, C. & A. R.R.'s; about 28 miles southeast of Annapolis. The manufactures are chiefly iron machinery, fertilizers, carriages, wagons, lumber, flour, canned fruits, furniture, and shirts. Pop. 3,124.

Easton, Mass., town in Bristol County, on the New York, N. H. & H. R.R., about 25 miles south of Boston. There are several villages included in this town. The manufactures are chiefly shovels, machine-shop products, hardware, shoes, wire, and automobiles. Pop. 4,912.

Easton, Pa., city, county-seat of Northampton County; on the Delaware at the mouth of the Lehigh River; on the Pennsylvania, the Lehigh V., the Central of N. J., and other railroads; 75 miles southwest of New York, and 60 miles north of Philadelphia. The coal and slate found in the vicinity in large quantities affects the industries of the place. Its manufactures are mining implements, railroad supplies, boots, shoes, hosiery, organs, and other articles. The mayor is elected every three years. Pop. 25,300.

Eastport, Maine, city and port of entry in Washington County, on Moose Island, in Passamaquoddy Bay, and on the Washington County R.R.; 190 miles east-northeast of Portland. It is the northeast frontier city of the United States, and has a fine harbor, with daily steamship service with Boston, Calais, and Portland. The city has extensive fishing and ship-building interests, a sardine-packing establishment with 20 factories, public high school and library, national and savings banks, weekly newspapers, and electric lights. Pop. 5,500. Consult: Kilby, 'Eastport and Passamaquoddy.'

Eastward Position, the position assumed by many clergymen of the Anglican Church during part of the communion service, the clergyman being placed in front of the communion table with his back to the congregation. This position has been a cause of much controversy. It was decided, in 1870, that such a position during the prayer of consecration is illegal; but if the "manual acts" of the priest are visible, the position appears to be legal by a decision of 1891.

Eastwick, Edward Backhouse, English Orientalist, and diplomatist: b. Warfield, Berkshire, 13 March 1814; d. Ventnor, Isle of Wight, 16 July 1883. He was a voluminous writer on Oriental (especially East Indian) subjects, and rendered very important service to English literature by many translations from Persian and Hindu, for example: Sadi's 'Gulistan,' or 'The Rose Garden' (1852); and the version of Pilpay's fables called 'Anvār-i-Suhaili' (1854). He also wrote a 'Journal of a Diplomat's Three Years' Residence in Persia' (1864); and 'Ven-

ezuela,' or 'Sketches of Life in a South American Republic' (1868). Between 1878 and 1882 he brought out a sumptuous edition of the 'Kaisar-nama-i-hind,' or 'Lay of the Empress.' He was a frequent contributor to literary journals.

Eaton, Amos, American scientist: b. Chatham, N. Y., 1776; d. 1842. He was graduated at Williams College 1799; settled in Catskill, N. Y.; practised law, and engaged in civil engineering, while prosecuting studies in chemistry, geology and mineralogy. He made a survey of Albany and Rensselaer counties 1820, and later of the Erie Canal region. Among his works are: 'An Index to the Geology of the Northern States' (1818); 'A Manual of Botany of North America' (1833); and 'Geological Note-Book' (1841).

Eaton, Amos Beebe, American army officer: b. Catskill, N. Y., 1806; d. 1877. He was graduated at West Point, and after serving on the northern frontier received the brevet of major 1847. He served as purchasing commissary at New York during the Civil War, and was brevetted major-general 1865.

Eaton, Arthur Wentworth Hamilton, Canadian writer: b. Kentville, Nova Scotia. He was graduated from Harvard in 1880, entered the Episcopal ministry, and was rector of St. Andrew's Church, Chestnut Hill, Mass., 1885-7. Since 1888 he has been an assistant master in the Cutler school for boys in New York. He is the author of 'The Heart of the Creeds: Historical Religion in the Light of Modern Thought' (1888); 'Arcadian Legends and Lyrics' (1889); 'Letter Writing: Its Ethics and Etiquette' (1890); 'The Church of England in Nova Scotia, and the Tory Clergy of the Revolution' (1891); 'Tales of a Garrison Town' (with C. L. Betts) (1892); 'College Requirements in English' (1900).

Eaton, Charles H., American Universalist clergyman: b. Beverly, Mass., 15 Aug. 1852. He is a graduate of Tuft's College 1874, and of Tuft's College divinity school 1877. He was ordained at Palmer, Mass., 1877; and in 1881 became pastor of the Church of the Divine Paternity in New York 1881, succeeding Rev. E. H. Chapin.

Eaton, Charles Warren, American artist: b. Albany, N. Y., 22 Feb. 1857. He studied at the National Academy of Design, and the Art Students' League, New York, and in London; and is a member of the American Water Color Society, New York. He exhibited at the Paris Exposition 1900.

Eaton, Daniel Cady, American botanist: b. Fort Gratiot, Mich., 12 Sept. 1834; d. New Haven, Conn., 29 June 1895. He was a grandson of Amos Eaton (q.v.); was graduated at Yale College in 1857, and professor of botany there 1864-95. He accompanied the government expedition to the Wasatch Mountains in Utah. His best-known publications are: 'The Ferns of North America'; and 'Ferns of the Southwest.'

Eaton, Dorman Bridgman, American lawyer: b. Hardwick, Vt., 27 June 1823; d. New York 24 Dec. 1899. He was graduated at the University of Vermont in 1848, and at the Harvard Law School in 1850; was admitted to the New York bar; and later became widely known by his advocacy of civil-service reform. In 1883

he was appointed a commissioner of the United States Civil Service Commission, resigning in July 1885. He was reappointed in November of the same year, but again resigned in April 1886. In the latter year he drafted the laws which created the Metropolitan Board of Health of New York; subsequently those on which the present police courts were organized; and in 1883 the National Civil Service Act. His publications include: 'The Independent Movement in New York' (1880); and 'Civil Service in Great Britain' (1880). He also edited the 7th edition of Kent's 'Commentaries.'

Eaton, John, American educator: b. Sutton, N. H., 5 Dec. 1829. He was graduated at Dartmouth College in 1854; studied theology; and in 1862 became chaplain of the 27th Ohio Volunteer infantry. Subsequently he was appointed superintendent of freedmen for Mississippi, northern Louisiana, Arkansas, and west Tennessee, and remained on duty till May 1865. He was brevetted brigadier-general of volunteers in 1865. In 1871-86 he was commissioner of the United States Bureau of Education; in 1895 became president of Sheldon Jackson College at Salt Lake City; and in 1898 was appointed a special commissioner to arrange for the establishment of the American system of education in Porto Rico. His publications include: 'History of Thetford Academy'; 'Mormons of To-day'; 'The Freedmen in the War' (report); 'Schools of Tennessee' (report); and reports of the United States Bureau of Education.

Eaton, John Henry, American statesman: b. Tennessee 1790; d. 1856. He practised law in Nashville, and was secretary of war 1829-34, when he became governor of Florida. He was appointed minister to Spain 1836, and published a 'Life of Andrew Jackson' (1824).

Eaton, Margaret O'Neill ('PEGGY O'NEILL'): b. Washington 1796; d. 1879. As the wife of Major J. H. Eaton, Jackson's secretary of war, she was the subject of a social war in government circles owing to certain charges connecting her name with that of Major Eaton, while she was still wife of purser Timberlake, her first husband. It was said that from this social disturbance arose an estrangement between Gen. Jackson and Calhoun, leading to the nomination of Van Buren for the presidency 1836. After the death of her second husband she married a third, an Italian dancing-master, much her junior, from whom she was divorced.

Eaton, Seymour, American editor and author: b. Canada 1859. He served for five years as director in the Drexel Institute, and was director of the Home Study Circle of the Chicago *Record* for several years. He is widely known as the founder and president of the Book-lovers' Library. Among his works are: 'Business Forms'; 'How to do Business'; 'The New Arithmetic.'

Eaton, Theophilus, American colonial governor: b. Stony Stratford, Buckinghamshire, England, about 1591; d. New Haven, Conn., 1658. He came over to Massachusetts with the Rev. John Davenport, 1737, founding with Davenport the town and colony of New Haven, in 1638. He was chosen governor October 1639, and re-elected annually as long as he lived. He was prominent in the organization of the New

England Confederation 1634, and the so-called Connecticut "Blue Laws" were drawn up by him, assisted by Davenport, 1655.

Eaton, Thomas Treadwell, American Baptist clergyman, and author: b. Murfreesboro, Tenn., 16 Nov. 1845. He was graduated at the Washington and Lee University 1867; was ordained (1870) to the Baptist ministry, holding pastorates successively at Lebanon, Chattanooga, Tenn.; Petersburg, Va., and Louisville, Ky. Since 1887 he has been the editor of the 'Western Recorder.' Among his works are: 'The Angels' (1873); 'Talks to Children'; 'Talks on Getting Married'; 'The Bible on Women's Public Speaking'; 'Wives and Husbands'; 'The Theatre'; 'How to Behave as a Church Member'; 'Conscience in Missions'; and 'Faith of Baptists.'

Eaton, William, American officer: b. Woodstock, Conn., 23 Feb. 1764; d. Brimfield, Mass., 1 June 1811. He served in the army 1780-3, and then went to Dartmouth College, where he was graduated 1790. Becoming captain in the United States army in 1792, he served in campaigns against the Indians till 1798, when he was sent to Tunis as American consul. During the war against Tripoli in 1801 he resolved to re-establish Hamet Caramelli as Bey of Tripoli, but was not supported in his attempt by the American naval officers. He returned to America in 1803, and was subsequently appointed naval agent of the United States for the Barbary powers. Returning to Africa he captured the city of Derne 27 April 1805, but the United States concluding a treaty of peace with the usurper Yussuf, Eaton returned to America in the autumn of 1805. The State of Massachusetts granted him an estate of 10,000 acres in Maine.

Eaton, William Wallace, American politician: b. Tolland, Conn., 11 Oct. 1816; d. Hartford, Conn., 19 Sept. 1898. He received a common school education; became a lawyer; and settled in Hartford in 1850. During the Civil War he was called a "Peace Democrat," and urged resistance to any Massachusetts troops passing through Connecticut. He was a member of the United States Senate in 1875-81; and of the House of Representatives 1883-5.

Eaton, Wyatt, American artist: b. Phillipsburg, Quebec, 6 May 1849; d. Newport, R. I., 7 June 1896. After studying in New York, and abroad, he returned to the United States in 1876, and settled in New York. He was one of the founders of the Society of American Artists and later served as its secretary and president. His works include portraits of Bryant, Longfellow, Emerson, Whittier, Holmes, etc.

Eaton, Ohio, village, county-seat of Preble County, on the Pittsburg, C. & St. L. R.R. It is a trade centre for an agricultural section. Pop. 3,246.

Eatonton, ē'ton-tón, Ga., city, county-seat of Putnam County; on the Central of Ga. R.R.; about 68 miles southeast of Atlanta. It is the trade centre for a section in which are raised fruit, and cotton. Its manufactures are dairy products, and cotton goods. Pop. 2,000.

Eau, ô, a French word signifying water, and used in English with some other word for several spirituous waters, and particularly perfumes: (1) *Eau de Cologne*, a fragrant water

made originally and in most perfection in Cologne. It was invented by Farina. (2) *Eau Cr  le*, a highly esteemed cordial made in Martinique, West Indies, by distilling the flowers of the mammee apple with spirit of wine. (3) *Eau de Javelle*, a preparation of chloride of soda, used as an antiseptic, and a bleaching agent. (4) *Eau de Luce*, invented by a person named Luce, at Lille, in Flanders, is a volatile preparation, made from oil of amber, alcohol, and ammonia. It is a milky fluid, powerfully antispasmodic, and stimulant. Mixed with nitric acid it forms a substitute for musk. (5) *Eau de Paris*, a substitute for cologne, and which is sometimes taken in sweetened water as a cordial, and stimulant. (6) *Eau de Vie*, a brandy; specifically the less perfectly purified varieties, the best being called cognac. (7) *Eau de vie de Dantsig*, a white liqueur, or cordial, sweet and strong, in which are introduced for ornament small particles of gold-leaf. (8) *Eau de vie d'Hendaye*, a sweet French cordial, of which there are three varieties—white, green, and yellow.

Eau Claire,    kl  r, Wis., city, county-seat of Eau Claire County, at the mouth of the Eau Claire River, and the head of navigation of the Chippewa River, and on the Chicago & N.; Wisconsin C., and several other railroads; 85 miles east of St. Paul, and 150 miles northwest of Madison. It is the commercial centre for northwestern Wisconsin, and the outlet of the Chippewa lumber district, with extensive water power. It has a great trade in lumber, and manufactures over 300,000,000 feet annually. There are extensive manufactures of iron and linen goods, furniture, machinery, and shoes. The city is noted as a summer resort, and has electric railroads, and street lights, waterworks, public library, and high school. Sacred Heart Hospital, national and savings banks, daily and weekly newspapers. Pop. (1900) 17,600.

Eaux-Bonnes,   -b  n, France, a celebrated watering-place, department Basses-Pyr  n  es, at the bottom of a narrow gorge, about 25 miles south of Pau. The springs, which have a temperature of about 90  , are strongly impregnated with sulphur. About 6,000 to 10,000 visitors resort hither in the course of the season, which lasts from June to October. Pop. (1891), 735.

Eaux-Chaudes,   -sh  d, France, a watering-place in France, three miles southeast of Eaux-Bonnes. Some of its springs have the same properties as those of the Eaux-Bonnes, and others are more strongly impregnated with sulphur.

Eaves or Cliff Swallow, one of the familiar North American swallows (*Petrochelidon lunifrons*) common about buildings where, as explained under BARN-SWALLOW, it has taken up its residence as fast as the country became settled. It is to be recognized by the squareness of the tail (not deeply forked as in its larger associate, the barn-swallow), the chestnut rump, whitish belly and blue spot on the breast. It is most peculiar, however, in its nests, which are always attached to the outside of the building, and usually in close row under the protection of the eaves. These nests are made of pellets of mud; are shaped like bulbous flasks with a curved neck forming an entrance; and are attached by their base to the

wall. In the primitive wilderness these nests are attached in crowded colonies to the faces of cliffs, where whole masses would frequently scale off by reason of the weight or of the loosening action of rain. Much safer and better conditions are found under the protection of the eaves of buildings; and not only has this swallow everywhere taken advantage of this fact, but striking modifications in their architecture have followed. The eggs closely resemble those of the barn-swallow, and two broods are usually raised. The species abounds in suitable localities all over the continent, migrating to the tropics in winter.

Eaves'drip, an ancient custom, or law, corresponding to the well-known urban servitude of the Romans called stillicide, where a proprietor was not allowed to build to the extremity of his estate, but must leave a space regulated by the charter by which the property was held, so as not to throw the eavesdrop on the land of his neighbor.

Ebal,   'bal, a mountain in Palestine, nearly 3,000 feet in height; 35 miles north of Jerusalem, situated north of Mount Gerizim, from which it is separated by a narrow valley containing the town of Nablus, anciently Shechem. Here the Israelites were commanded, on their entrance into the Holy Land, to set up an altar to Jehovah of hewn stones. The fulfillment of this is recorded in Joshua (viii. 30-35). From Mount Ebal the curse for disobedience to the law was pronounced, the blessing for obedience being given from Mount Gerizim, which lies across the valley. The modern Arabic name of Ebal is Jebel Eslamiyah.

Ebel'ians, German sect, named after Ebel, a Prussian archdeacon, one of the founders. It arose in K  nigsberg, Prussia, about 1836, the Archdeacon Ebel and Dr. Diestel being its leaders. They believed in spiritual marriage. In 1839 sentence was passed against their leaders, who were charged with unsound doctrine and impure lives, but it was removed in 1842. Their enemies called the sect Mucker, that is, in German, hypocrites.

Ebeling,   'bel-ing, **Christoph Daniel**, German scholar: b. Garmissen, near Hildesheim, Hanover, 20 Nov. 1741; d. Hamburg 30 June 1817. He was noted for his extensive knowledge of Oriental languages, of classic and foreign literature, and of history and geography. He published a history and geography of North America (1796-1816), for which he received a vote of thanks from the United States Congress. He paid special attention to the geography of the New World, and collected about 10,000 maps and nearly 4,000 books, all relating to America. This library was purchased in 1818 by Israel Thordike of Boston, and presented by him to Harvard College.

Ebenezer,   b-  -n  'z  r (Heb. "the stone of help"), commonly used as any memorial of divine assistance, originally the name of a field where, at Samuel's request, the Lord discomfited the Philistines with thunder, etc. On this occasion Samuel set up a stone, and gave it this designation, to indicate that the Lord had helped them. The site has never been definitely ascertained.

Ebensburg, Pa., borough, county-seat of Cambria County; on a branch of the Pennsyl-

vania R.R., about 79 miles east of Pittsburg. The manufactories are woolen-mills, tanneries, saw-mills, and iron-works. It is about 2,300 feet above sea-level. Pop. 1,621.

Eberhard, a'bër-härt, Christian August Gottlob, German poet and descriptive writer: b. Belzig 12 Jan. 1769; d. Dresden 13 May 1845. His verse is a reminiscence of the 18th century style and of the school of Gleim, the idyl 'Little Hans and the Cookie' (1822); and 'Various Poems' (1833), eminently so. His best prose is in 'Italy as It Impressed Me' (1839).

Eberhard, Johann August, yō-hän ow'-goost, German philosophical writer: b. Halberstadt 31 Aug. 1739; d. there 6 Jan. 1809. He first attracted attention with a 'New Apology of Socrates' (1772), an attack upon the narrow theology of the day, to which succeeded 'Universal History of Philosophy' (1788); 'Handbook to Æsthetic' (1803-5); and other works from a Wolffian standpoint, in harmony with Leibnitz and in opposition to Kant.

Eberle, a'bër-le, Robert, German artist: b. Meersburg 22 July 1815; d. Eberfing, near Munich, 19 Sept. 1860. He was a pupil of Biderman and later of Van de Velde. His talent was particularly displayed in painting sheep. One of his works, 'A Shepherdess,' is in the Modern Gallery, Munich.

Eberlein, Gustav, German sculptor: b. Spierkershausen, Hanover, 1847. His chief work is a long frieze ornamenting the façade of the Ministry of Cults, Berlin, with 50 figures attending religion. He did other decorative work for the University of Kiel. Among his works are: 'Drawing out a Thorn'; 'Greek Flute Player'; 'Psyche,' and the 'Archer.' From his hand also are five allegorical groups at Stuttgart, and monuments of William I. at Elberfeld, Geisslingen, Mannheim, Altona, and Ruhrort, and one of Frederick I. in Berlin. He is the author of 'Aus Eines Bildners Seelenleben, Plastik, Materie und Poesie' (1892).

Ebers, Emil, a'mël ä bërs, German artist: b. Breslau 14 Dec. 1807; d. Beuthen 1884. He studied at the Academy of Düsseldorf and early turned his attention to dramatic subjects such as scenes of battle in the Middle Ages, brigandage, sailors, fishermen, etc. In later years, after traveling much and visiting the shores of the North Sea, Holland, and Normandy, he devoted himself to marine painting exclusively. Among his works are: 'Smugglers About to Land' (1830), in the National Gallery, Berlin; 'Fisherman's Hut' (1831); 'Smugglers Surprised' (1832); 'Smugglers in Tavern' (1835); 'Repressing Revolt'; 'Dutch Smugglers on Coast of Normandy' (1842); 'Prussian Hussars Maltreating French Peasants' (1843); 'Life Boat' (1844); 'Pilot Boat' (1845); 'Storm on Inland Sea' (1845); 'Mutiny on Brig' (1848); and some historical paintings, such as 'St. Goar converting the Rhine Provinces.'

Ebers, Georg Moritz, gā-örg mō'rīts, German Egyptologist and novelist: b. Berlin 1 March 1837; d. Tutzing, Bavaria, 7 Aug. 1898. About 1859 he began to devote himself almost exclusively to Egyptological studies, and in 1868 was appointed extraordinary professor of the language, history, and antiquities of ancient Egypt at Jena. In the following year he traveled in Egypt, Nubia, and Arabia, and on his

return in 1870 became ordinary professor of Egyptology at Leipsic. Another visit to Egypt in 1872-3 resulted in the discovery of the important medical papyrus, now known by his name. Among his published contributions to Egyptology are: 'Disquisitiones de Dynastia vicesima sexta Regum Agyptiorum' (1865); 'Ägypten und die Bücher Moses' (Vol. I., 1868, not completed); 'Durch Gosen zum Sinai' (1872); 'Papyrus Ebers' (1875); 'Eine Galerie antiker Portraits' (1889); 'Die hieroglyphischen Schriftzeichen der Ägypter' (1890); and 'Ägypten in Bild und Wort' (1878-9), translated into English as 'Egypt, Descriptive, Historical, and Picturesque' (1880). Besides these works he published many novels, mostly dealing with Egyptological subjects, among which are: 'Eine Ägyptische Königstochter' ('An Egyptian Princess' 1864); 'Uarda' (1877); 'Homo Sum' (1878); 'Die Schwestern' ('The Sisters' 1880); 'Der Kaiser' (1881); 'Serapis' (1885); 'Josua' (1889); 'Per Aspera' (1892); 'Kleopatra' (1894); and 'Arachne' (1897). He also published a poem called 'Elison' (1888), and an autobiography (1892), entitled 'Die Geschichte meines Lebens.' A collective edition of his works was published at Stuttgart (1893-7).

Eberswalde, ä-bërz-väl-de (ancient NEUSTADT-EBERSWALDE), Germany, town on the Finow Canal, about 28 miles northeast of Berlin. It is a busy industrial centre, having a number of machine-shops, saw-mills, paper-mills, and iron-works, and doing a considerable trade in lumber and coal. There is here a royal academy of forestry. Eberswalde is a favorite summer resort for the people of Berlin. Pop. 18,500.

Ebert, ä'bërt, Karl Egon, Austrian poet and dramatist: b. Prague 5 June 1801; d. there 24 Oct. 1882. He began with dramas of Bohemian history, many of which were staged but only one printed, 'Wratislav and Jutta' (1835). As a lyric poet and balladist he was more successful; his 'Poems' (1824) contain fine lyrics, and 'Schwerting the Saxon Duke' is still high in popular favor. His longer poems — 'Vlasta: a National Hero-Poem of Bohemia,' and 'The Monastery,' are fluent in style as well as pure and elegant in language. 'A Monument to Karl Egon, Prince of Fürstenberg,' consists of a garland of sonnets; 'Devout Meditations of a Man of the World' is a didactic poem.

Ebionites, ē'bi-ōn-its, a sect composed of Jewish believers in Jesus of Nazareth as being the Christ or Messiah, who nevertheless retained many of the practices and beliefs of their ancestral religion. Their name, Ebionites, seems to be formed from the Hebrew word *ebionim*, poor folk; but some of the ancient writers, unacquainted with the history of the primitive church of Jerusalem and Judea and with the Hebrew language, derive the name from that of a supposititious heresiarch Ebion. If the name was originally *ebionim*, 'the poor,' the sect will have chosen for itself in effect the same name as the mediæval sect of the Poor Men of Lyons. The Ebionites are by many authors confounded with the Nazarenes or Nazarites, another body of Christians Jewish by race and in a measure also Jewish in religion. The rise of the Ebionite sect is commonly referred to the time of Trajan, when, the whole Jewish race being excluded

from Ælia Capitolina (as Jerusalem was named anew), these people, despised alike by Jews, Christians, and pagan Romans, migrated to Peræa, the country beyond the Jordan, and there freely developed their religious tenets and practices. They were Jewish rigorists, zealots, with some tinge of Christian belief, in that they held Jesus to have been the Messiah; but they held him to be only man and begotten like other men. The Mosaic law they believed to be of everlasting obligation upon all believers in Jesus Christ whether of Jewish or Gentile race. St. Paul they regarded as a traitor and arch-apostate for his having declared Mosaism superseded by the law of Christ. Of the Christian sacred books they held the Hebrew gospel of St. Matthew to be the only one given through Divine inspiration.

Eblis, or **Father of Devils**, in Arabian mythology, the ruler of the evil genii or fallen angels. Before his fall he was called Azazel or Hharis. When Adam was created, God commanded all the angels to worship him; but Eblis replied: "Me thou hast created of smokeless fire, and shall I reverence a creature made of dust?" God was very angry at this insolent answer, and turned the disobedient angel into a Sheytân (devil), and he became the father of devils. He is described as of enormous size, with a red-striped skin, a ring-pierced nose, long hair, large flapping ears and a very long tail. See **DEVIL**.

Ebner-Eschenbach, äb'nër ësh'en-bähr, **Baroness Marie von**, Austrian author: b. (COUNTESS DUBSKY) Castle Zdislavice, Moravia, 13 Sept. 1830. Beginning in 1860 as a playwright, her 'Mary Stuart in Scotland' (1860), and the tragedy 'Marie Roland,' with the one-act dramas 'Doctor Ritter,' 'Violets,' and 'The Disconsolate One,' were but moderately successful. Turning to fiction, 'The Princess of Banalia' (1872), a satiric tale, made little impression; but 'Two Countesses' (1885), a story of Austrian high society, met with striking favor. Her other writings include: 'Tales of Village and Castle'; 'The Child of the Parish' (1887); 'The Rival'; 'Aphorisms' (1880); and 'Parables, Stories and Poems' (1892).

Eb'nite, or **Vulcanite**, a name given by Goodyear for what is generally known as hard rubber. It is a vulcanite with a larger proportion of sulphur and certain added ingredients. The proportion of sulphur is from 30 to 60 per cent, and to this may be added certain amounts of shellac, gutta-percha, sulphates of zinc, antimony, or copper. It is used of many colors, as may be gathered from the above list of ingredients, and of hardness and consequent facility for taking polish. The compound, despite its name, may resemble horn, ivory, bone, wood, etc. See **VULCANITE**.

Ebony, various kinds of wood obtained from several species of *Diospyros*, a genus of trees of the natural order *Ebenaceæ*. The most valued and most frequently used varieties are very close-grained, hard and dark-colored, the best qualities black. This grade is obtained from *D. ebenus*, a native of the eastern tropics, especially India. It is a large tree from which logs containing a cylinder of the dark heart wood more than 18 inches in diameter are often obtained. The sap wood is less valued, being of

lighter color and less hard. The wood is especially valued for inlaying, cabinet work, musical instruments, etc. Various other names are given to certain varieties of ebony obtained from other regions, as calamander wood, cadoobergia wood, etc. Occasionally specimens of *D. virginiana*, popularly known throughout the southern United States as the common persimmon, furnish a fair grade of ebony. Several other trees, especially of the genus *Maba*, yield varieties of ebony, as do also a few trees of the order *Leguminosæ*. Bastard ebony is obtained from species of Jacaranda, Brazilian trees. Imitations of ebony are sometimes made by dyeing hard, close-grained woods so as to resemble the genuine ebony.

Eboracum, ē-bŏr'a-kŭm, the Latin name of York. Hence New York is styled in Latin works "Novum Eboracum."

Ebro, ā'brō (Lat. *Iberus*), a river in Spain, once the boundary between the territory of Rome and Carthage, has its source in the province of Santander, 10 miles west by north of Reynosa. Pursuing a southeast course of about 500 miles, it flows into the Mediterranean by two mouths. It is navigable for boats up to Tudela, about 180 miles from its mouth, but is obstructed by shoals and rapids, to avoid which a canal, about 100 miles long, has been constructed south of and nearly parallel to the river.

Ebs'worth, **Joseph**, English dramatist and musician: b. London 10 Oct. 1788; d. Edinburgh, 22 June 1868. He wrote, adapted, or translated many successful plays; among them 'The Rival Valets' (1825), a comedy drama, and 'The Crusaders' (1850-1), a drama. He was an adapter rather than a creator. His songs, learning, and versatility made him a distinguished figure in Edinburgh circles. He wrote also in collaboration with his wife, Mary Emma (Fairbrother).

Ebullition, ēb-il-lish'ŏn, the bubbling up or agitation which results from the action of heat on a liquid. The escape of vapor from water depends not merely upon the temperature, but upon the presence of gases and other bodies, upon the vessel, and a variety of circumstances, so that a strict definition is necessary. The usual statement is that ebullition is the conversion of a liquid into a vapor or gas having the same tension or elastic force as the air. This conversion takes place at different temperatures for different substances, but it is so constant for each substance that the fixity of the boiling-point of a fluid is regarded as a very good test of its purity. In determining what that point is, it is of course necessary to ascertain what the atmospheric pressure is, to see that it does not vary during the experiment, and to fix upon some standard pressure for comparison of results. The pressure is estimated by the barometer. It is possible to heat water 20° F. above its boiling point without ebullition. See **HEAT**.

Eça de Queiroz, José Maria, hō-sā' mā-rē'ä ā'sā-dā-kā'rōs, Portuguese novelist: b. Póvoa do Varzim 25 Nov. 1845; d. Neuilly, France, September 1900. At first a journalist, he traveled and was in the consular service in many parts of the world. He introduced the naturalistic school into Portugal. His powers of observation and description are extensive, and in his novels — 'The Crime of Father Amaro'

(1874, rewritten in 1880); 'The First Monk of St. Basil' (1877); 'A Relic' (1886) — he portrays in master strokes the failings of Portuguese society. His strange, half realistic, half fanciful story, 'The Relic,' weaves into a narrative of Oriental travel a dramatic representation of the Passion of Christ in the form of a dream. In collaboration with Ramalho-Ortigão he wrote the spirited tale of adventure, 'The Mystery of Cintra Street.'

Écarté, ā-kār-tā, from the French, meaning discard, a game at cards for two persons. The game is played with a piquet pack, that is 32 cards, the small cards, from 2 to 6, being excluded. For convenience of dealing, two packs are generally used. The players cut for the deal; the lowest card (in France the highest) deals. The dealer gives 5 cards to each player, 3 and 2 at a time, and turns up the 11th card as trump (French, *atout*). If the turn-up is a king he scores 1, and if a king turns up in the hand of either player the holder may score 1, but in each case this must be announced before the first trick by saying, "I mark king." The king is the highest card, the queen next, then knave, ace, 10, etc. Trump takes all other suits. In playing the non-dealer leads; the other player must follow suit, and take the trick if he can; if he cannot follow suit, he must play trump, if he holds one. The winner of the trick leads again till the 5 tricks are exhausted. Three tricks count 1 point, 5 tricks 2 points. Five points make a game. The player, according to the French game, must announce the suit he plays, and if he plays differently, can be compelled to play as he announces, or if he cannot, as his adversary pleases.

Ecbatana, ěk-bāt'a-na, the chief city or ancient metropolis of Media, built, according to Pliny, by Seleucus. It was the summer residence of the Persian and Median kings, and existed in great splendor at a very early period in the history of the world. There are no traces now remaining of the site of this celebrated city.

Eccard, Johannes, German composer: b. Mühlhausen, Thuringia, 1553; d. Berlin 1611. He became Kapellmeister to the Margrave of Brandenburg at Königsberg in 1589, and in 1608 became Kapellmeister in Berlin. He is noted as a composer of hymns and other church music.

Ecce Homo, ěk'sē hō'mō ("Behold the Man"), the rendering, in the Latin Vulgate, of the words with which Pilate presented Christ, in scarlet robe and crowned with thorns, to the populace. The figure of Christ in this scene is the subject of a celebrated painting by Correggio which is preserved in the National Gallery of Painting in London. Other great painters have chosen the same subject, among them Guido Reni, whose 'Ecce Homo' is in the Picture Gallery of Dresden.

Eccentric, or **Eccentric Circle**, in ancient astronomy, a circle whose centre was supposed to be displaced from the centre of motion. It was a makeshift to try to account for the motions of the planets before Kepler's discovery of their true motion in ellipses with the centre of attraction at one of the foci of the ellipse. Also, in mechanics, a term applied to contrivances for converting circular into reciprocating rectilinear motion, consisting of variously shaped disks attached to a revolving shaft.

Eccentricity, deviation from a centre; the state of a circle without reference to its circle; also applied to persons, as oddity, whimsicalness, etc.

Ecchymosis, ěk-ī-mō'sīs, a subcutaneous hemorrhage due either to bruising or some form of external injury, or occasionally the result of a peculiar blood disease hæmophilia. Ecchymoses usually result in varying grades of discoloration, and are best treated by means of hot water, locally applied.

Ecclefechan, ěk-l-fēn'ān, Scotland, village of Dumfriesshire, nearly a mile from a station on the main line of the Caledonian R.R., 20 miles northwest of Carlisle. Its interest is that it is the birth- and burial-place of Thomas Carlyle, and is unmistakably the "Entepfuhl" of his famous spiritual autobiography, 'Sartor Resartus.' The house in which he was born, 4 Dec. 1795, still stands, and in the west corner of the churchyard around the United Presbyterian Church, which represents the old Secession Church, he was laid, as he wished to be, beside his father and mother. Pop. 750.

Eccles, Robert Gibson, American chemist: b. Scotland 1 Jan. 1848. He came to the United States in 1862 and became chemist in the Bureau of Indian Affairs; and professor and dean in the Brooklyn College of Pharmacy. He has discovered calycanthic acid and the alkaloids calycanthine, glaucusine, etc., and devised the official method of assaying pepsin and investigated the effects of drugs on peptic digestion. He also exposed numerous fraudulent medicines, among them the Scotch oats essence. He has written more than 100 articles on philosophic and scientific subjects.

Eccles, England, a municipal borough in Lancashire, four miles from Manchester, of which it is a suburb. There are here numerous cotton-mills. Pop. 34,369.

Ecclesfield, England, a township in the West Riding of Yorkshire, six miles north of Sheffield. The chief manufacture is cutlery, then flax, linen, paper, and nails; while in the vicinity there are coal and iron mines. Pop. 26,000.

Ecclesia ("convocation"), a popular assembly, especially that of Athens, where the people exercised full sovereignty, and at which every citizen of 20 years of age was entitled to vote. The people voted either by show of hands or occasionally by ballot, the latter method being by white and black pebbles. Beside the legislative powers of the assembly, it could make inquisition into the conduct of magistrates, and in turbulent and excited times exercised a power resembling that of impeachment, as in the cases of Demosthenes and Phocion. The assembly was sometimes suddenly broken up at the occurrence of an unfavorable omen, as thunder and lightning, sudden rain, or any unusual natural phenomenon. The Athenian ecclesia held originally 4, ultimately 40, ordinary meetings in the year. The term was also applied by the Septuagint translators to the Jewish commonwealth, and so was naturally adopted by New Testament writers to designate the Church.

Ecclesiastes, or **The Preacher** (Heb. *Kohaleth*, "assembler"), one of the didactic books of the Old Testament canon, professing to be the words of the preacher, the son of David,

king in Jerusalem. It contains allusions to the writer's riches, palaces, and parables, and its sententious style reminds one of the author of the Proverbs. Yet its diction is marked by Chaldaisms and linguistic usages which are thought not to have been introduced into the Hebrew language till about the period of the Babylonian captivity. The authorship of the Ecclesiastes has been attributed to Solomon, whose claims have often been challenged and always defended; and if it be not his, it must remain entirely uncertain, for no writer of the Babylonian period is known so nearly resembling him in wisdom and wealth of thought. The book consists of philosophical reflections upon human life, and while it affirms: "Vanity of vanities, all is vanity," it also comes to the conclusion of the whole matter in the words: "Fear God and keep his commandments, for this is the whole duty of man." Some entertain the opinion that its original form must have been a dialogue in which the sage carries on a discussion with a skeptic and a libertine. Yet it is more commonly regarded as the monologue of a Hebrew moralizing on life and searching for the highest good, scanning the perversities and follies of man, and at length, after a review of the evidence, declaring the verdict that obedience to God is the only real and substantial good.

Ecclesiastical Commissioners, for England, are a body corporate with a common seal, perpetual succession, and power to hold real estate, constituted by acts 6 and 7. Will. IV. chap. lxxvii., 3 and 4 Vict. chap. cxiii., and 13 and 14 Vict. chap. xciv. It consists of all the bishops of the Church of England, the deans of Canterbury, St. Paul's, and Westminster; the chief justices, 5 cabinet ministers, and other legal dignitaries, and 12 lay members appointed by the crown and the archbishop of Canterbury. This body has extensive powers in regard to the organization of churches, the distribution of episcopal duties, revenues, etc. The schemes adopted by the commission, on being laid before the king in council, approved of, and gazetted, acquire the force of acts of Parliament.

Ecclesiastical Titles Act, a law of the British Parliament, enacted in 1850 (14 and 15 Vict. chap. 60) to prohibit, under penalty, the assumption of ecclesiastical titles (for example: Archbishop of Westminster, Bishop of Clifton, Dean of Sheffield) by any persons not duly appointed to such stations according to the laws of the realm touching the Church establishment. There was already in the statute book a law of 10 Geo. IV., chap. 7, which provided that any person who should assume or use the name, style or title of archbishop of any existing ecclesiastical province, or bishop of any existing diocese, or dean of any existing deanery of the Established Church of Great Britain, and Ireland, the same not having due legal right to such name, etc., should for each violation of the act forfeit £100. But in the year 1850 Pope Pius IX., by apostolic brief, instituted an ecclesiastical province or archbishopric comprising all England and Wales, with Nicholas Wiseman (afterward cardinal) as archbishop, with the style and title of Archbishop of Westminster, and with 12 suffragan bishops presiding over dioceses named: Beverley, Birmingham, Clifton, Hexham, Liverpool, Newport and Menevia, Northampton, Nottingham, Plymouth, Salford, Shrewsbury and Southwark; none of

these towns was then the see of any bishop of the Established Church; and therefore the prohibition of the statute of George IV. did not apply. But the announcement of the setting up of these Roman Catholic dioceses provoked a fierce anti-popery agitation, and the prime minister, Lord John Russell, introduced in the Parliament a bill, which was speedily passed, extending the penalty of the act of George IV. to persons who should assume the titles archbishop, bishop or dean "in respect of any places within the United Kingdom." The new dignitaries ignored the act, assumed their titles, braved prosecution, and not one of them was ever called into court for contumacy. After the act had stood on the statute book as the law of the realm during 20 years it was amended by the act of 34 and 35 Vict., chap. 53. The penalty was dropped, but the so-called repealing act recited again the legal grounds for the penal enactment and declares that "no ecclesiastical title of honor or dignity derived from any see, province, diocese, or deanery recognized by law, or from any city, town, place or territory, within the realm can be validly created"; and that "no pre-eminence or coercive power can be conferred otherwise than under the authority of Her Majesty"; decisions of law that had never been impugned in England since the time of Henry VIII.

Ecclesiology, the science of the Church as an organized society, a branch of knowledge which deals with ecclesiastical antiquities, such as buildings, rites, vestments, etc.

Ec'cleston, Samuel, American Roman Catholic prelate: b. Kent County, Md., 27 June 1801; d. Georgetown, D. C., 21 April 1851. He was educated in St. Mary's College, Baltimore, and ordained to the priesthood of the Roman Catholic Church 1825. He subsequently served St. Mary's College as vice-president and president; became archbishop of Baltimore in 1834; and established the College of St. Charles in 1850. He was president of five provincial councils and inaugurated the movement which resulted in the laws for the transmission of church property from a bishop to his successor and for the excommunication of any Roman Catholic who, after being divorced by the State, should marry again.

Ecdysis, the process of casting the skin (see **MOLTING**). The term is used mainly in reference to the exuviation of the pupa of insects, and of the outer cuticle of lower invertebrates, as crabs.

Ech'ard, or Eachard, Laurence, English clergyman and historian: b. Barsham, Suffolk, 1670 (?); d. Lincoln 16 Aug. 1730. His 'History of England from the First Entrance of Julius Cæsar and the Romans to the End of the Reign of James the First' (1707) contains a wealth of information, including the particulars of Cromwell's interview with the Devil on the morning of the battle of Worcester. Other historical and scholarly works increased his reputation.

Echegaray, José, hō-sā' ā-chā''gā-rā'ē, Spanish dramatist: b. Madrid 1832. He is author of several treatises on mechanics and civil engineering, and was for a time minister of commerce and of public instruction. Since 1874, when the production of 'The Avenger's Bride' opened a new and brilliant life for the Spanish

stage, he has given himself wholly to the drama; producing in a few years 30 plays rich in imagination, dramatic force, and lyric talent, though with the true Spaniard's love of the horrible. Of his greatest pieces may be named: 'The Great Galeotto'; 'Madman or Saint'; 'Conflict Between Two Duties'; 'A Merry Life and a Sad Death.' See Zacher, 'Don José Echegaray' (1892).

Echellen'sis, Abraham, Maronite scholar: b. Ekhel in the Maronite country of Mount Lebanon; d. 1664. He was an alumnus of the College of the Maronite nation at Rome, and was called to the chair of Syriac and Arabic in the College of the Propaganda. From 1630 till 1642 he was engaged at Paris in making Arabic versions of books of Scripture for a Polyglot Bible; afterward, from 1652 till his death, he was employed in similar work under the auspices of the Congregation de Propaganda Fide at Rome. He made Latin translations of numerous works in Arabic.

Echelon, esh'elōn (Fr. "a ladder or stepping stone"), used in military language. A battalion, or regiment, marches *en échelon*, or *par échelon*, if the divisions of which it is composed do not march in one line, but on parallel lines. The divisions are not exactly behind each other, but each is to the right or left of the one preceding, so as to give the whole the appearance of a stairway. This order is used if the commander wishes to bring one part of a mass sooner into action and to reserve the other. If the divisions of the *échelon* are battalions, these are generally from 100 to 200 steps from each other. An *échelon* is said to be direct if its head maintains a position perpendicular to the original line, as in direct attack or retreat; it is said to be oblique when it deviates from the line, as in changing the order of formation.

Echeneis, ek-ē-nē'is, a genus or family of fishes. See REMORA.

Echenique, José Rufino, hō-sā' roo-fē'nō ā-chā-nē'kā, Spanish-American soldier and statesman: b. Puno, Peru, 1808; d. Arequipa 18 Oct. 1879. He joined the Patriotic party as a boy, rose to the rank of colonel and induced the revolted troops of Gamarra and Bermudez to return to their allegiance in 1833; at the battle of Yungay 1839, he fought on the side of Vera Cruz, in 1845 was a member of Castillas council of state, and in 1851 was elected president of Peru. In 1854 he was charged with financial irregularities and Domingo Fias led a revolt against him which terminated in the battle of Saraija 1854. He was defeated in a second revolt, at the bridge of Iscuchacha, 2 Aug. 1854, retired to Lima, was again defeated at the battle of La Palma, 5 Jan. 1855, and driven into exile. He was permitted to return as a private citizen and was even a presidential candidate in 1872, but spent the last years of his life in retirement.

Echeverria, ā-chā-vā-rē'ā, Estaben, Argentine poet: b. Buenos Ayres, Argentina, 1809; d. Montevideo, Uruguay, 1851. He was educated in France and was banished from Argentina by Rosas. Among his works, which are in great repute among his countrymen are: 'Consuelos' (1834); 'Rimas'; 'Cautiva' (1837), containing delightful descriptions of the pampas; 'Guitarra' (1842); and 'La Insurreccion del Sud' (1849).

Echid'na, or **Spiny Ant-eater**, an Australian monotreme animal of the family *Echidnidae*, or *Tachyglossidae*, closely related to the duckbill, but very different in outward appearance. Echidnas are spiny, porcupine-like creatures, 12 to 18 inches long, with broad bodies, stout legs terminating in large, strong claws well suited for digging, and a small head, ending in a slender snout. The mouth is toothless but the palate bears a number of recurved spines, which answer the purpose of teeth; the tongue is extensile and glutinous. The animal resembles the hedgehog in that it curls up when in danger, presenting its long spines, and protecting by this method its naked belly. It lives in burrows and feeds chiefly on the juicy larvæ of ants, into whose hill its digs with its great claws. Like the duckbill, the echidna lays eggs, but little is known as to their hatching. The creatures are docile and are easily tamed, becoming playful in captivity and exhibiting considerable intelligence. They are nocturnal in habits, and spend periods of drought curled up in their burrows. The common echidna (*E. aculeata*) is found in Tasmania and New Guinea. It is so variable in color and size that it is sometimes held to form two species, differentiated by their general size and habitat. The "nodiak" of Papua (*Proechinida* or *Acanthoglossus bruijnii*) is a kindred animal hunted by the natives for food.

Echinades, ẽk'n'a-dẽz (modern KURZOLARI), a group of islands at the entrance of the Gulf of Corinth, and now in part united to the mainland by deposits brought down by the Achelous River. It was near these islands that the Battle of Lepanto was fought in 1571. See LEPANTO, BATTLE OF.

Echinocactus, ẽ-kĩ-nõ-kak'tũs, a genus of plants of the natural order *Cactaceæ*, characterized by globular or shortly cylindrical forms with prominent ribs and strong spines. Over 200 species, mostly Mexican, have been described; about 40 species are natives of the southwestern portion of the United States, extending as far north as southern Utah, Colorado, and Nevada. The flowers, which are highly colored, mainly in shades of yellow and red, are borne just above the areas producing the youngest spines and are succeeded by dry or succulent fruits of no economic use. The plants are raised with comparative ease from seeds, given abundant light, but not direct sunlight, which tends to dry the little seedlings, supplied moderately with water before the soil has a chance to bake, and kept in a temperature of about 60 degrees. When about two inches in diameter they may occupy single pots as specimens. About 50 species are cultivated in American greenhouses, and are among the favorite plants of their order.

Echinococcus, ẽ-kĩ-nõ-kõk'us, a small tapeworm (*Tania echinococcus*), to which is due the disease called "hydatids" in man and in various animals. See TAPEWORM.

Echinoc'ereus, a genus of plants of the natural order *Cactaceæ*, with generally low, thickly clustered stems, mostly short funnel-formed, brilliantly colored flowers of various tints, and globose or ellipsoidal fruits which are spiny until they reach maturity. By some botanists the genus is united with *Cereus*, from which it is distinguished mainly by technical characters that are present in some species of

ECHINODERMS.

ECHINODERMATA — ECHINOIDEA

each group. About 25 pieces are general favorites in American greenhouses. They are cultivated in about the same way as *Echinocactus* and *Cereus* (qq.v.).

Echinodermata, ĕ-kī-nō-dēr-ma'-ta, or **Echinoderma**, one of the most distinct phyla of the animal kingdom, embracing the crinoids, sea cucumbers, sea urchins, and starfishes. On account of a predominating radial symmetry Cuvier united them with the *Cœlenterata* in his type *Radiata*. Leuckart was the first to clearly perceive that only a superficial resemblance exists between the members of these two great groups and to him is due the elevation of the *Echinodermata* to the importance of a distinct phylum. The skin is always more or less indurated by the deposition of calcium carbonate in the form of variously shaped spicules, spines, disks or plates, either isolated or united to form a reticulum or a continuous test. There is a principal axis around which most of the organs of the body are repeated five times in a radial manner. While this pentamerism is generally predominant, certain organs (madreporic plate, stone canal, "heart") occur in but one radial axis which, therefore, lies in a median plane to which all other organs are bilaterally related. Of the repeated organs the digestive glands, radial canals, nerves, various vessels, the eye-spots, and some others, are radial, the genital organs (single in *Holothuroidea*) and polian vesicles interradial in position. The partial suppression of one ray or two rays, and among the starfishes a multiplication of rays, may take place; furthermore, in some *Echinoidea* and *Holothuroidea* certain of the organs or rays may shift so extensively with regard to the principal axis and the median plane that the original pentamerism becomes obscured. There is a well-developed coelom or body cavity and a closely connected "blood" or pseudohæmal system which consists of an axial organ or "heart," a circumoesophageal ring, radial vessels, and a more or less extensive system of lacunæ. In addition to the blood vascular system there is a very characteristic water-vascular system which, when typically developed, consists of a median madreporic or sieve plate and stone canal, a circumoesophageal canal bearing polian vesicles and other diverticula, and giving rise to radial canals which in turn bear rows of ampullæ and tube feet. The latter are the chief organs of locomotion, and the most important function of the water-vascular system is to provide for their distention by means of the water which is strained through the madreporic plate and enters the stone canal. In some cases the tube feet assume an exclusively respiratory function. With few exceptions the sexes are separate and, following fertilization in the water external to the body, a free swimming larval form develops, except in a few cases, from the egg. This is always bilaterally symmetrical, has a curved alimentary canal with mouth and anus, and a more or less complicated ciliated tract of cilia or separate circles of cilia, and a pair of coelomic pouches. Older larvae often develop irregular processes and a larval skeleton. The larvae of the several classes differ considerably in structural details and have been named auricularia, bipinnaria, pluteus, etc. The Echinodermata are exclusively marine. Four classes may be recognized, as follows:

Crinoidea, usually fixed to the sea bottom by the aboral surface; the mouth uppermost and the viscera all contained in the central disk or theca. When arms are present they are solid and usually branched. Stone lilies or crinoids. Here belong also the extinct blastids and cystids which are often regarded as forming separate classes.

Stelleroidea, never fixed to the sea bottom; the mouth or oral surface always in contact with the surface over which they are moving; tube feet confined to the oral surface; form stellate. There are two quite distinct sub-classes, the *Ophiuroidea*, or brittle stars, serpent stars, and basket stars; and the *Asteroidea*, or true starfish.

Echinoidea, never fixed to the sea bottom; ambulacral areas with the tube feet extending more or less over the aboral surface; form compact, more or less discoid or spheroidal. Sub-classes, *Regularia*, or regular sea-urchins; and *Irregularia*, or irregular sea-urchins.

Holothuroidea, never permanently fixed to the sea bottom; water-vascular system with a circle of oral tentacles; more or less elongated along the principal axis to a cucumber or wormlike form; skeleton in the form of separate plates or sometimes totally wanting. See CUCUMBERS.

For further information consult: Lankester, 'Treatise on Zoology,' (Part III.), and articles on the several classes.

Echinoidea, ĕk-ī-noi'de-a, or **Sea Urchins**, a class of *Echinodermata* with a more or less spheroidal or discoidal body enclosed in a continuous test or shell composed of polygonal pieces of various shapes accurately fitted together and arranged in radial rows. Alternating ambulacral and interambulacral areas, usually repeated five times, may be recognized. The former exhibit rows of perforations for the tube feet, generally reaching to the aboral pole. The skeletal plates support movable spines which sometimes attain a great size and are used in defense and to a certain degree in locomotion. In addition, the integument bears the remarkable structures known as pedicellaria, which are three-jawed pincers borne on movable stalks, which by continually snapping and bending carry away particles of faecal matter and secure cleanliness. The beginning of the digestive canal is frequently provided with a complicated masticatory apparatus known as Aristotle's lantern, and the canal itself is tubular and looped, usually not pouched. The gonads are interradial with outlets to the exterior near the aboral pole. Development may be direct or through the larval form called pluteus, which is provided in its later stages with long processes supported by movable spicules. The number of known Echinoidea is very great, many of them being fossil. There are two sub-orders:—*Regularia*, form regular, spheroid; mouth and anus at opposite poles of the central axis, and the latter usually surrounded by small skeletal plates; in only a few cases are external gills present. Here belongs the common sea-urchin (q.v.). *Irregularia*, form markedly bilateral; anus always displaced from the apical pole into the posterior inter-radius and the mouth frequently in the opposite direction, in which case the form is sometimes heart-shaped. Examples are the sand-dollar and heart urchin (qq.v.).

Echinorhynchus, ě-kī-nō-rīng'kūs, a parasite worm. See **ROUNDWORMS**.

Echo, from the Greek, meaning "sound," noise; a sound repeated by reflection, or a sound heard again at its source. The waves of sound on meeting the surface are turned back in their course according to the same laws that hold for reflection of light. Even clouds are capable of producing echoes, as is observed at sea when a gun is fired off under a dense cloud. Echoes from the clouds also, in all likelihood, play an important part in the long rolling of thunder. In order that the echo may return to the place from which the sound proceeds the reflection must be direct, and not at an angle to the line of transmission, otherwise the echo may be heard by others but not by the transmitter of the sound. This may be effected either by a reflecting surface at right angles to the line of transmission, or by several reflecting surfaces which end in bringing the sound back to the point of issue. To make a distinct echo the reflected sound must be concentrated rather than diffused. To this result a degree of concavity in the reflecting body is conducive. If the sound is repeated several times, which is the case when it strikes against objects at different distances, many echoes are heard. The reflecting surface must be at a certain distance, in order that the echo may come to the ear after the sound, and be distinctly separated from it. Sound travels about 1,100 feet in a second; consequently, an observer standing at half that distance from the reflecting object would hear the echo a second later than the sound. Such an echo would repeat as many words and syllables as could be heard in a second. This is called a *polysyllabic* echo. If the distance is less, the echo repeats fewer syllables; if only one is repeated, then the echo is *monosyllabic*. The most practised ear cannot distinguish in a second more than from 9 to 12 successive sounds, so that a distance of not less than 60 feet is needed to enable a common ear to distinguish between the echo and the original sounds. Echoes at least distances, as from the walls of churches and public halls, are liable to mix with and destroy the distinctness of the original sound.

Echo, in classical mythology, a nymph (one of the Oreads), who, according to fable, was changed by Hera (Juno) into a rock, because her loquacity prevented Hera from listening to the conversation of Zeus with the nymphs. The use of her voice, however, was left her so far as to be able to repeat the last word which she heard from others. Another account is that Echo fell in love with Narcissus, and because he did not reciprocate her affection she pined away until nothing was left but her voice.

Echo Cañon, a gorge in northern Utah, not far from Salt Lake, through which the Union P. R. R. passes. The high almost vertical walls of the cañon have fantastic carvings made by the elements, principally water. The peculiar echo heard within the gorge has given it its name.

Echolalia, ěk-ō-lā'li-a, a peculiar form of verbal repetition which occurs in certain nervous, hysterical, and insane people. It consists in the ceaseless repetition of words that rhyme,

or apparently rhyme, or the continued utterance of some definite sentence or parts of a sentence. A like symptom termed *verbigeration* is frequently found in terminal dementias and allied mental states, and is to be distinguished from *echolalia*, which it closely resembles, by the repetition of meaningless and disconnected phrases. *Echolalia* is seen to best advantage in hysteria and in a peculiar type of mental disease known as *catatonia* (q.v.).

Echter, ěh'tēr, Michael, German painter: b. Munich 5 March 1812; d. there 4 Feb. 1879. He studied at the Munich Academy, as a pupil of Hess, Zimmermann and Olivier. He assisted Kaulbach in work on the mural paintings in the Berlin Museum, painted the 'Battle of Lechfeld' for the Maximilianeum; the 'Betrothal of Frederick Barbarossa with Beatrice of Burgundy' and 'The Burial of Walther von der Vogelweide' for the National Museum in Munich; and 30 scenes from the 'Nibelungenlied' for the royal residence. He was appointed professor in the School of Industrial Arts, and was a member of the Munich Academy.

Echtler, ěht'lēr, Adolf, German painter: b. Dantzig, Prussia, 1843. He studied at the Venice Academy under Karl Blaas, and at the Munich Academy, and took the gold medal at Berlin 1875. Among his works are: 'A Difficult Problem'; 'Peaceful Company'; 'Honi Soit qui mal y pense' (1877); 'Souvenir of Italy'; 'Those whom I have always loved' (1879); 'The Kiss' (1880); 'Neapolitans in Normandy'; 'In the Morning' (1881); 'Repentant Sinners' (1882); 'Ruin of a Family'; 'All is Vain'; 'Souvenir of Venice' (1884); 'Five Orphans' (1885).

Echuca, ě-choo'ka, Australia, town in the colony of Victoria, on a peninsula at the junction of the Campaspe with the Murray River. It is opposite Noama, in New South Wales. It has a trade, partly by the river, in timber, wool, and wine, and the vine is cultivated in the neighborhood. Pop. about 5,000.

Ecija, ā'thē-hā (Rom. ASTIGI; AGUSTA FIRMA), Spain, a town in the province of Seville, on the Genil, 42 miles northeast of Seville. It is of very ancient origin, and according to tradition was visited by the apostle Paul. At a very early period it became an episcopal see, and its importance under the Romans is attested by many ancient remains. The climate is so hot that Ecija is often called the "Oven of Andalusia." Pop. in 1887 23,615.

Eck (Eccius), Johann Maier von, a Catholic theologian, life-long adversary of Luther: b. Eck, Suabia, 13 Nov. 1486; d. Ingolstadt 1543. His father, a peasant named Maier, assumed the name Maier von Eck or Maier of Eck, after becoming bailiff of his village. Johann, at the age of 11 years, entered the University of Heidelberg whence he passed to the University of Tübingen and there at the age of 14 years took the degree of master of arts. He now successively at Tübingen, Cologne, and Freiburg universities studied divinity, jurisprudence, and mathematics, and at the same time was instructor in philosophy. He was appointed professor of theology in the University of Ingolstadt (1510). While on his travels in Italy (1515) he took part in a public disputation in

the University of Bologna and won high distinction; in 1516 on a similar occasion at Vienna he had a like success. In 1518 he published a pamphlet, 'Obelisci,' in defense of the Catholic doctrines attacked in Luther's celebrated 'Theses' of 31 Oct. 1517. Eck was now chancellor of the University of Ingolstadt and Luther put forward Carlstadt as a defender of the 'Theses'; Carlstadt not only replied to Eck in print, but challenged him to a public disputation. Eck accepted the challenge, and the disputation was held at Leipsic, with Eck as the champion of Catholicism against both Carlstadt and Luther. The disputation was commenced 27 June 1519, and lasted till 15 July. Upward of a year previously Luther in a letter to one of his friends credited Eck with eminent scholarship and great natural gifts, but after the disputation he was for Luther "a pitiful theologian" and "a miserable sophist." The numerous audience and the townsmen with unanimity awarded the crown of victory to Eck, and Luther in a private letter to his intimate friend Spalatinus, confesses defeat. Eck, stimulated by his success, devoted himself thereafter wholly to working for the overthrow of his adversaries. He procured from the universities of Cologne and Louvain a condemnation of Luther's writings and was honored at Rome with the commission to publish in Germany Pope Leo's bull *Exsurge Domine* against Luther. But he was received with manifestations of popular enmity almost everywhere; even at Leipsic the bull was solemnly committed to the flames by the students and the populace. On several notable occasions afterward—at the diet of Augsburg (1530), the conferences at Worms (1540) and those at Ratisbon (1541), he was again a principal champion of Catholicism. Some of his works are a German translation of the Old Testament, and a revision of Luther's translation of the New Testament. His pamphlets and books against the doctrines of Luther are included in 'Operum Johannis Eccii contra Lutherum.'

Eckels, James Herron, American financier: b. Princeton, Ill., 22 Nov. 1858. He was graduated at the Albany, N. Y., Law School 1880, and practised law at Ottawa, Ill., 1881-93. From 1893 till 1897 he was United States comptroller of currency. He is a Gold Standard Democrat, and president of the Commercial National Bank of Chicago.

Eckermann, Johann Peter, yō'hān pā'tēr ēk'ēr mā, German poet: b. Winsen, Hanover, 21 Sept. 1792; d. Weimar 3 Dec. 1854. He has a permanent place in literature through his record of 'Conversations with Goethe in the Last Years of his Life' (1823-32); which has been translated into nearly all the languages of Europe, even Turkish. He edited the 40-volume edition of Goethe's works (1839-40).

Eckert, Thomas Thompson, American telegrapher: b. St. Clairsville, Ohio, 23 April 1825. In 1852-9 he was superintendent of the telegraph line between Pittsburg and Chicago; in 1859-61 superintendent of a gold-mining company in North Carolina; and in the latter year was appointed superintendent of the military telegraph department of the Potomac, with the rank of captain. Subsequently he was general superintendent of the military telegraph of the army, and was brevetted brigadier-general of volunteers for his services. In 1864-6 he

was assistant secretary of war; in 1866-75 general superintendent of the eastern division of the Western Union Telegraph Company; in 1875-81 president of the American Union Telegraph Company, and in 1892 became president and general manager of the Western Union Telegraph Company. He retired in 1902.

Eckford, Henry, American naval architect: b. Irvine, Scotland, 12 March 1775; d. Constantinople 12 Nov. 1832. He became a ship-builder in New York, in 1796; designed and constructed a fleet of war vessels for the United States government in 1812-14; built the Robert Fulton, which made the first voyage by steam to New Orleans and Havana; became naval constructor at the Brooklyn navy yard in 1820; and built several war vessels for European and South American governments.

Eckhart, ěk'hārt, Johannes ("MEISTER ECKHART"), the first of the German mystics in order of time and among the foremost in rank; the probable place of his birth is Cologne, and the year 1260 or a little earlier; d. 1329. He studied philosophy and theology in the University of Paris and joined the order of the Preaching Friars, or Dominicans, in which he was promoted to offices of high responsibility, for example, that of vicar-general of the Dominicans for Bohemia, provincial of the order in Saxony. In these places he effected many reforms in the houses of the order and was in high estimation as a preacher notwithstanding the abstruseness of his mystical speculations. Toward the end of his life this dissemination of his mystical views touching the nature of God and the relations between Deity and the human soul brought him under suspicion of being in sympathy with the Beghards, the Brethren of the Free Spirit, the Apostolic Brethren, and other fanatics, and 1327 he was cited before the court of inquisition at Cologne to make answer to charges of heretical teaching based on passages in his sermons. There he defended the inculcated propositions as entirely orthodox, but expressed his readiness to repudiate them if in the judgment of the head of the Church they were in conflict with the Church's creeds. In 1329 the decision arrived from Rome: 28 propositions contained in his sermons were condemned as heretical and Eckhart was ordered to recant; but he was now dead.

Whether these 28 propositions were or were not formally heretical, contradictory of the express teachings of the Church, they certainly contain doctrines that never have been put forth in any of the Church's formularies. However extravagant, they might have been tolerated or ignored, had they been entertained or discussed merely in the schools of theology and philosophy; but proclaimed from the pulpit and addressed to the common people, some of them ignorant, they were incitations to rebellion against all Church authority in teaching. His doctrine concerning the Godhead is plainly pantheistic-agnostic. For him there is no real being but God. God is the unknown and the unknowable. We cannot validly affirm anything of the Godhead; to predicate anything of Deity is to limit infinity. Yet though God is unknown and unknowable, and though we cannot predicate anything of him, still we can know the true God, the personal God, the Father; in this personal God, the Godhead it-

ECKHEL — ECLECTICISM

self. The triune God, Father, Son and Spirit, is evolved from the Godhead. And the Father comes to know himself in the Son; the return of the Son into the Father is the Spirit. In begetting the Son—who is coeternal with the Father—the Father brings into existence the universal world of things. As all things have sprung from the Father, so all things return to him. In the consummate union of man with God man is one with God; its will is God's will, its acts God's acts. Therefore it cannot sin. Having gone to such lengths of mystic speculation it is highly improbable that Master Eckhart could have recanted sincerely; but refusal to recant would have cost him his life or at least, his liberty. It was well for his fame that he died before he would have to make the election. His death occurred a little while before the arrival of the Pope's condemnation of his doctrines.

Eckhel, ěk'ĕl, **Joseph Hilary**, Austrian numismatist: b. Enzersfeld, Austria, 1737; d. 1798. After becoming a member of the society of St. Ignatius he was appointed keeper of the imperial cabinet of medals and professor of archæology at Vienna. Eckhel may be regarded as the founder of the science of numismatics, the principles of which are elaborately developed in his treatise, '*Doctrina Nummorum Veterum*' (1792-8). He also published catalogues of the ancient coins and gems in the imperial cabinet, and other learned treatises.

Eckstein, ěk'stĕn, **Ernst**, German humorist, poet, and novelist: b. Giessen 6 Feb. 1845. From the university he went to Paris, and there completed his comic epos '*Check to the Queen*' (1870), and wrote '*Paris Silhouettes*' (1873), the grotesque night-piece '*The Varzin Ghosts*,' and the '*Mute of Seville*.' Later he wrote the stories: '*Margherita*'; '*At the Tomb of Cestius*'; '*The Mosque at Cordova*.' He was editor of a literary and critical journal, '*Hall of Poets*,' and of a humorous weekly, '*The Wag*,' at Leipzig for some years, and in 1885 settled in Dresden. He is a very prolific and inventive writer, and a master of technique. Besides a multitude of brilliant humorous sketches, he has written many stories of ancient classic life, as '*The Claudii*'; '*Aphrodite, a Story of Ancient Hellas*'; '*Decius the Flute-player: a Merry Story of a Musician in Ancient Rome*.'

Eck'storm, Fannie Hardy, American author: b. Brewer, Maine, 18 June 1865. She was graduated at Smith College 1888, and was married to Rev. J. A. Eckstorm 1893. She has published '*The Bird Book*' (1901); '*The Woodpeckers*' (1901).

Eclampsia. See PUERPERAL ECLAMPSIA.

Eclampsia Infantum. See INFANTILE CONVULSIONS.

Eclectic (from the Gr. *εκλεκτικός*, select), selecting, choosing; relating to the Eclectics, certain philosophers of antiquity, who, without attaching themselves to any particular system, or forming one of their own, professed to select from the various existing systems what they believed to be true, and thus to construct a new and complete whole. The name originated with

the Alexandrian philosophers, or Neo-Platonists, who professed to gather and unite into one body whatever was true in all the systems of philosophy. The chief representatives of this school are Plotinus, Porphyry, Iamblichus, Proclus, and Clemens Alexandrinus. Modern eclecticism is considered to have taken its rise in the 17th century with Bacon and Descartes; but in the 19th century it received a fresh impetus through the labors of the German philosopher Hegel, and the term eclectic has come to be specially applied to a number of French philosophers who differ considerably from one another. The earliest were Royer-Collard and Maine de Biran; but the name is more appropriately given to the school of which Victor Cousin, Théodore Jouffroy, Damiron, St. Hilaire, Rémusat, Garner, and Ravaisson were the most distinguished members. The views of Cousin varied considerably at different periods of his life, and he not only adopted freely what pleased him in the doctrines of Laromiguière, Royer-Collard, and Maine de Biran, of Kant, Schelling, and Hegel, and of the ancient philosophers, but he expressly maintained that the eclectic is the only method now open to the philosopher, whose function thus resolves itself into critical selection and nothing more.

Eclecticism, a term applied at the present day, to the principles and practice of an ancient as well as a modern school of medicine. It is derived from a Greek word meaning "to select" and was well applied to the ancient school. In the modern school, however, "selecting the best," has played but a minor part in comparison to doctrines originating within the school, such as the theory of specific medication, a doctrine distinctly its own. In the early centuries a number of distinct schools of medicine arose. Among these were the dogmatic, methodic, pneumatic, and empiric. From these arose the Eclectic, or episynthetic. The physicians of this sect wished it implied that they had made a rational selection of all that was best in the other medical schools. The practice of Areteus, who, though not the founder, did the most to consolidate its doctrines, was simple, rational, and by far the most judicious of the ancients up to his time.

Modern Eclecticism, in the United States, embodies the principles and practice of the Eclectic, or American school of medicine founded by Dr. Wooster Beach in New York city, in 1825. It was first known as the American Reformed school. While it employs most largely remedies of vegetable origin it must not be confounded with Thomsonianism, a popular form of botanic practice taught and practiced by Dr. Samuel Thomson in New England in the early part of the nineteenth century, the peculiar theories and extreme measures of which were never adopted by the Eclectics. Among the most bitter antagonists of the latter were the followers of Thomson. As students and developers of indigenous materia medica the American Eclectic practitioners have been the most assiduous in all history, and in this field they have won the admiration of the rival schools of medicine. The majority of Eclectics of the present day adhere to the doctrine of specific medication, the basic theory of the

ECLIPSE

modern school, promulgated by Dr. John Milton Scudder, of Cincinnati, Ohio, in 1869. The Eclectic or American school of medicine of today is distinctively a school of specific therapeutics. (See MEDICINE, ECLECTIC.)

H. W. FELTER, M. D.

Eclipse (Gr. *ἔκλειψις*, from *ἐκλείπειν*, to forsake the accustomed place, to fail to appear), an obscuration of the light of a heavenly body by another, effected either, directly, by its intervention between the body and the observer, or, indirectly, by its interception of the source of light which illumines the body. The earth, by means of its shadow, may indirectly cause an eclipse of the moon. Similarly, eclipses of the Jovian satellites are caused by immersion in the shadow of Jupiter, and for the system of Saturn a more complicated result arises on account of its ring. When the shadow of a satellite falls upon either of these planets it is called a transit of the shadow. Eclipses are not observable in the other planetary systems, since, in the case of Mars, the satellites disappear in the light of the planet, and with the more distant planets the shadow cone extends too slight a distance beyond the disk. Again, our moon can by its direct interposition between the sun and the earth produce eclipses of the sun. Similar occurrences are observed in the Jovian and Saturnian systems and are then called transits of the satellites, but in the outer planets have not as yet been observed. The moon may interpose itself between the stars or planets and occult them (see OCCULTATION), and the other bodies of the solar system may act similarly. The eclipses of the sun by the inner planets are designated transits (see TRANSITS), but the obscuration of satellites and stars by the disks of planets are called occultations. The most important of these phenomena are the eclipses of the sun and moon.

Eclipses of the Moon.—A lunar eclipse is caused by the interposition of the earth between the sun and the moon and the moon's consequent immersion in the shadow of the earth. This can occur only when the moon is in opposition to the sun on the heavens, at the time of full moon, and both sun and moon are near the moon's nodes, i. e. the points where her orbit crosses the plane of the ecliptic. Let the sun, earth and moon be regarded as spherical bodies and their centres ranged in a right line. Then the sun will project beyond the earth a conical shadow called the *umbra*, in which the moon is centrally immersed. The surface of this cone will be described by a line tangent to the same side of both sun and earth and moving about the line joining their centres. The apex of the shadow cone, or of the *umbra*, is on the average about 157,000 miles beyond the earth's centre, and the diameter of the umbral cone at the point where the moon crosses it on the average about two and two thirds the diameter of the moon, with a variation from scarcely twice to more than three times the lunar diameter. If, again, two lines tangent on opposite sides of the sun, and crossing between sun and earth, move about the line joining the centres of these bodies, these lines will describe the surface of two cones of which the one extending beyond the earth is that of the *penumbra*. Unless the moon be near one of her nodes at the time of full moon, she will not strike the shadow, but pass

below or above it. If the sun is less than 4 days from a node of the moon's orbit, an eclipse must occur; if more than 14 days from a lunar node, an eclipse is impossible. These are called the lunar eclipse limits. Since the moon must be quite near her node to produce a lunar eclipse, it may happen that an entire year may elapse without an eclipse of the moon. The lunar eclipses may be either partial or total according as the moon is immersed either partly or entirely in the earth's shadow cone. The phenomena of a total lunar eclipse are of a simple character. The immersion of the moon in the penumbra can be observed only with difficulty. The edge of the shadow itself presents a hazy outline when seen in a telescope, and the times of contact cannot be observed with accuracy. When completely within the earth's shadow, the moon is usually still plainly visible in a dull copper-colored illumination which is produced by the sunlight shining through the earth's atmosphere, suffering absorption of its higher tints, and experiencing deflection into the shadow cone through refraction. Lunar eclipses have, however, occurred in which the moon was almost entirely invisible during the total phase. The obscuration of the earth's atmosphere by clouds accounts for these dark eclipses. Specially bright lunar eclipses have, on the other hand, been attributed to terrestrial auroras occurring at the same time. The most interesting physical observations effected during its eclipse concern the luminous and heat radiations of the moon. Valuable astronomical observations then possible are the determinations of the times of occultation of faint stars whence precise values of lunar position, diameter, and parallax may be derived.

Eclipses of the Sun.—Solar eclipses can occur only at the time of new moon. If the sun be more than 19 days from a node of the moon's orbit, an eclipse is impossible, if less than 10 days, a central solar eclipse is inevitable. These are the solar eclipse limits. The sun causes the moon to project toward the earth at new moon, umbral and penumbral shadow cones differing in the main only in size from those which the earth projects toward and beyond the moon at full moon. The method of conceiving the generation of the shadow cones of the umbra and of the penumbra are the same in solar as in lunar eclipses if the moon be substituted for the earth. The shadow cone of the moon may strike the earth's surface, but on the average does not. Two distinct cases may arise. First, the axis of the shadow cone strikes the earth's surface, and upon it the right line joining the centres of the solar and lunar disks, traces the curve of centrality. Here three cases result: (1) The apex of the shadow cone reaches the earth's surface and a central *total* eclipse occurs. (2) The apex of the shadow cone does not reach the earth's surface and there occurs a central *annular* eclipse. (3) The apex of the shadow cone reaches the earth's surface only at a middle stretch of the curve of centrality and there occurs a central *annular-total* eclipse. Secondly, the axis of the shadow cone does not strike the earth's surface but the earth still enters the shadow cone, or shadow cone produced, and there occur total, annular, and annular-total eclipses, all of which are of a non-central character. The

ECLIPSE

path of a total eclipse on the earth cannot exceed 167 miles in width and is often not over 135 miles, but it may traverse a length from west to east of several thousand miles. An annular eclipse has also a "path of the annulus" in which the annular phase is visible. Outside of both of these paths the sun is only partially eclipsed. The least number of eclipses, solar and lunar, which can occur in a year, is two, and these must be central eclipses of the sun, while the maximum number occurring is seven, two of the moon and five of the sun. The average number hardly exceeds four. The minimum number of two eclipses is determined by the fact that the sun in its annual path crosses both nodes of the moon's orbit. The retrograde motion of the moon's nodes around the ecliptic continually changes the two eclipse seasons of the year, and is also responsible for the famous cycle of eclipses discovered and used long before its physical explanation was possible. A simple record of the date and character of the eclipses revealed to early astronomers the fact that after a period of about 18 years, eclipses again recur in the same order and kind whether solar, lunar, total, or partial. This cycle, called the saros, is one of 223 lunar months, each of a little more than 29.5 days, and is precisely 6,585.32 days in length. Depending on the number of leap years, 5, or 4 intervening, this is equal to 18 years, 10.32 days, or 11.32 days. At the end of the saros, the relative positions of the sun, moon, and node of the moon's orbit are nearly the same as at the beginning, and other favoring factors of the motions of the sun and moon also recur, as Newcomb first pointed out, to nearly original values. The excess of one third of a day in the cycle causes the eclipse to be thrown about eight hours of longitude farther west on the earth's surface. Hence only after three cycles does the eclipse again recur in approximately the same longitude. If the intervening leap years be regarded, the application of the saros to various series of solar eclipses of the following table may readily be made.

Ancient eclipses are chiefly of value in historical and chronological investigation (see TIME). The records of the supposed eclipses of the ancient historians are usually very uncertain as to place, time, and character of the occurrence, and hence have proved of questionable value to the astronomer. The precise circumstances of an eclipse occurring centuries ago can readily be computed from the modern tables, but the comparison with the vague historical references has apparently contributed but little to science. Ginzel has, in his 'Special Canon of Eclipses,' collected a splendid array of ancient eclipse literature, and this has been used to derive corrections to the lunar tables, but Newcomb seems justly to question the validity of the results. The eclipses observed by the older astronomers and carefully recorded are of great value. And in later times the description of eclipses has been so accurately interwoven with even historical accounts as to furnish unquestionable data for chronology. The terror and apprehensive uncertainty associated with an eclipse in ancient times has given place to a lofty appreciation of the grand occasion, and to a careful and inspiring scientific study of the phenomena.

The annexed table of total solar eclipses

occurring during the present century has been prepared with the aid of the memoirs of Oppolzer and Mahler, and is a complete list of all the eclipses of the century having a total phase, however brief. The first column gives the date for the point on the earth where at noon the eclipse is central. The second column gives the Greenwich civil time of the conjunction of the sun and moon in longitude. The next column states the greatest interval in minutes during which the most favored place may experience the total phase. The fourth column gives the latitude and longitude of the place where the eclipse is central at noon. The last column indicates the areas traversed by the moon's shadow. Several of the eclipses, occurring in the polar regions, have no noon-point and hence, for these, the place of the beginning or end of the eclipse, lowest in latitude, is placed in the fourth, and the corresponding time, sunrise or sunset, in the last column. The nine annular-total eclipses of the century are indicated by a *, and in these the duration of total phase may be but a few seconds. Two of the list, namely 1928 and 1967, are non-central in character, the moon's shadow just grazing the pole of the earth.

It is not likely that the brief duration of total phase of a number of these eclipses will bar their astronomical use, particularly in the direction of spectroscopic and photographic investigations. The ever increasing importance of a thorough study of the rare and intricate phenomena of total solar eclipses, attested alike by the marvels still awaiting explanation, and by the progress already made, demands that every second of totality available shall be turned to the highest scientific uses.

The Phenomena Observed in Total Solar Eclipses.—As totality approaches, a pale purple coloring spreads over the landscape. Within a minute of the total phase the phenomena begin to succeed each other so rapidly that no single observer can note them all. By those glancing at the landscape in the direction of the approaching shadow a majestic darkness will be seen to sweep forward with a swiftness truly impressive. Those looking at the earth, and away from the eclipsing sun, will see a succession of flitting bands, alternately dark and bright, known as the *shadow bands*, which for many decades remained an unexplained puzzle. About 15 seconds before the total phase, the moon, with its sharp irregular outline, due to the elevations and depressions in its surface, will have diminished the solar crescent to such an extent that the remnant of it usually begins to be crossed by black lines.—the mountains on the moon's edge connecting the limbs of moon and sun. Then it rather suddenly presents the appearance of a string of detached brilliant points, irregular in size and spacing. These are the well-known *Baily's beads*, seen by Francis Baily on the occasion of the annular eclipse of May 15, 1836, and in an extended memoir on the remarkable phenomenon fully described. The explanation of the appearances was rightly suggested, as due to irradiation which alike exaggerates the length and thinness of the projected lunar mountains and the size of the resulting bright points or *beads* of the disappearing solar crescent. On each side of the point of disappearance, the chromospheric arc may be observed as a scarlet "sierra."

* Annular Total Eclipses.

ECLIPSE

Totality, the appearance of the prominences, whether *red* or *white*, along the moon's edge, and the presence of the radiant, outspreading corona, are simultaneous. The phenomena of the earlier eclipses were recorded in the most general manner. Hasty drawings of the streamers of the corona, accompanied by descriptions reflecting but the dawn of scientific method, are the chief results. It was not until the application of the spectroscope and the photographic camera that the astronomer attained real insight into the stupendous phenomena.

The great eclipse of July 8, 1842, may be said to mark the beginning of serious and accurate attention to the complex physical features of total solar eclipses. Then the path of totality swept from Spain across France, Italy, Austria, Russia, and central Asia, and thus permitted many expert European astronomers to view and record the marvelous phenomena. It is noteworthy that in reports of this eclipse the red solar prominences were first described with precision, three large ones having been seen on the upper edge of the moon. The corona was also described as of a brilliant white luminosity and extending at least 15' from the moon's edge. Among the many phenomena observed, the objects of special speculation were the newly discovered *red flames* or *protuberances* which Baily considered as "evidently forming a portion of the corona," and no less an authority than Airy, who had observed the eclipse through clouds, attributed to "some irregularity in the density of the cloud's edge."

The total solar eclipse of July 28, 1851, carrying the moon's shadow across Greenland, lower Sweden, and Russia, is notable as being probably the first for whose observation distinct aid was given by government authority, since with the assistance of the admiralty, the British astronomer royal, Airy, was able to conduct an important expedition to Sweden. Both the corona and the prominences were observed in greater development than in 1842, and by several observers a scarlet *sierra* or reddish arc of light was noted near those parts of the lunar disk where the rays of the sun had disappeared, or else were about to appear. The observers for the most part became certain that the prominences were true solar appendages, because they were apparently uncovered by the moon's edge on the western edge, and extinguished on the eastern limb. A precious photographic achievement was the single successful daguerreotype taken by Barowski with a telescope of 2.4 inches aperture, attached to the Königsberg heliometer, and with an exposure of 84 seconds. It distinctly pictured the corona and several prominences, and thus became the first unchallenged record of these features of an eclipse.

It was, however, at the eclipse of July 18, 1860, which traced its total path across northern Spain, the Mediterranean, and northeastern Africa, that photography was first applied with marked scientific success. Mr. Warren De la Rue, stationed at Rivabellosa with the Kew photo-heliograph, and Padre Secchi, at Desierto de las Palmas, with the Cauchoix refractor, each secured good representations of the prominences; the former also faint traces and the latter good portrayal of the corona. Comparison of these photographs set at rest, once for all, any doubt

still existing as to the true solar character of the prominences. The moon was undeniably shown to pass over them, and all the speculation which had attributed these strange scarlet projections either to lunar, or to terrestrial origin, was at an end. Many sketches of the corona, or of parts of it, had been made during this eclipse, some showing its extension to fully one degree. But Padre Secchi's plates, although depicting the corona as scarcely a quarter of a degree in width, exhibited the whole of it in great delicacy of tone and as traversed by curious dark rifts. The method of making hasty sketches and drawings of the corona had, as shown by the results of this and previous eclipses, brought no end of contradiction and had permitted comparison only in some of the most pronounced features. It was therefore destined more and more to fall into discredit, and to have its results accepted only as rude and preliminary. The photographic method of attacking the problems arising in total solar eclipses was from this time firmly established. Its progressive development was determined chiefly by three elements: First, increase in the sensitiveness of the plates; second, knowledge of the exposure times required; and third, necessary advancement in practical optics. The gelatin emulsion process introduced by Maddox in 1871, and given the touch of great sensitiveness by Bennett, in 1878, secured the first. Successive failure and success, coupled with scientific method in photometric study, brought the second. And, finally, refined theoretical discussion of the principles of optics as applied to celestial photography, coupled with marked improvements in optical manufacture, supplied the third. So that now by separate and regulated exposures, with specially designed instruments, either the outer long, delicate, coronal wings may be pictured to an extreme limit, or the intensely brighter parts of the inner corona, shown with all their involved filaments and rich tracery, and with many a curious relation to the prominences and chromosphere.

The unknown nature of the brilliant red prominences, boldly projecting beyond the moon's edge during an eclipse, had for a quarter of a century remained an unaccepted challenge. And hence the first and highly successful application of the spectroscope to their study during the total solar eclipse of Aug. 18, 1868, will always be memorable. Tracing its course across the Indian and Malayan peninsulas, and affording a total phase of more than five minutes and a half, this eclipse was spectroscopically observed by Janssen, Major Tennant, Lieutenant Herschel, Pogson, and Rayet. The light of the prominences was recorded by each of these experts as consisting of several bright lines clearly indicative of the gaseous nature of those remarkable objects. The hydrogen lines C and F were certainly identified, and a yellow line, thence to figure famously in astronomy as D₅ and as due to *helium*, was too hastily assigned to sodium. Another notable result of this eclipse was the discovery, by Janssen, of a method by which the bright lines of the prominences could be observed apart from any eclipse whenever the sky was sufficiently clear. "During the total obscurity, I was struck by the vivid splendor of the light of the protuberances; the thought immediately came to me that it would be possible to see them irrespective of eclipses," his

ECLIPSE

famous report begins. On the day following the eclipse he was able successfully to apply the new method; to demonstrate beyond controversy that the bright lines of hydrogen prevailed in the protuberances; and to make a third discovery always to be associated with this great Indian eclipse, namely, that of pronounced and rapid changes of form occurring in the prominences. Lockyer in England had for some time been at work on the same method for observing the bright prominence lines, and his final success was reported to the French Academy at the same meeting at which Janssen's achievements were announced. The coincidence was evidently rather determined by the progressive advancement of spectroscopic science than by accident. Huggins, who had previously indicated the theory of the Janssen-Lockyer method now suggested the widening of the spectroscopic slit as a means of disclosing the entire form of a prominence in a spectroscope of considerable dispersive power. The spectrum of the corona of this eclipse was generally observed as a faint continuous one without lines dark or bright. Rayet, indeed, noticed a certain bright line near E as extending above the prominences. The polariscopic observations of Lieutenant Campbell and Captain Branfl proved that the coronal light was polarized in planes passing through the sun's centre. The inference thus seemed doubly plain that some solar light was reflected by the corona, although the absence of the dark Fraunhofer lines required explanation.

The path of the moon's shadow during the total eclipse of August 7, 1869, lay diagonally across North America from Bering's Strait to North Carolina. The spectroscopic observations made in Iowa, at Burlington by Professor Young, and at Des Moines by Professor Harkness, established the existence of a bright green line crossing the continuous spectrum of the corona. It was estimated by the former as coincident with an iron line at 1474 of Kirchhoff's scale, or of a wave-length (λ) of 5317 ten millionths of a millimetre; and by the latter as at $\lambda 5300 \pm 14$. Professor Young's reading for the line of the unknown *coronium*, as it came to be designated, was practically that of a bright chromospheric line of approximately the same wave-length, shown by his observations some time prior to this eclipse. Young in 1876 by means of a higher dispersion proved 1474 K to be double. But it remained for the photographic records of the powerful spectrographs applied to the eclipses of 1896 and 1898 to furnish the data according to which Lockyer, Campbell, and Evershed could place the famous coronal line definitely at $\lambda 5303$ and thus separate it from its neighbor in the chromosphere.

The eclipse of December 22, 1870, trailing its path of totality over southern Spain, Sicily, and Greece, was of particular interest to the American observers who had studied that of 1869, and this resulted in the despatch of two large parties to Europe, one directed by the United States Naval Observatory and the other by the officers of the Coast Survey. If there remained any doubt as to the gaseous nature of the inner corona it was to be dissipated by the fine drawing and description of the inner corona furnished by Professor Watson of Ann Arbor, stationed at Carlentini, Sicily, and observing this gaseous shell to an elevation of about 5'; and by Profes-

sor Young's observations in Spain at Jerez de la Frontera, of the now familiar green line of coronium, visible plainly in this area, and traceable as far as 16' from the solar limb. The bright hydrogen lines C and F and the helium line D₃ were seen projected on the moon, and also about 5' outside of the lunar limb by Young. Plainly the light of the prominences and chromosphere must have been reflected from the earth's atmosphere, and possibly also from the corona itself, and commingled with its intrinsic radiation. This eclipse will, however, always be peculiarly famous for Professor Young's discovery of the *reversing layer* as a thin shell lying immediately above the photosphere. Kirchhoff's theory had demanded the existence of a solar atmosphere of vapors above the photosphere, which by its elective absorption should produce the dark lines of the solar spectrum. Janssen had expected to see the reversed solar spectrum in 1868, but in his notable report was obliged to say: "It must be admitted either that this atmosphere does not exist, or that its height is so meagre that it has escaped observation." Peculiarly interesting then for this time, and for the future, was Young's observation of a sudden bursting forth, at the disappearing solar edge, of innumerable bright lines having the general arrangement of the familiar dark lines of the spectrum. The existence of the reversing layer has since 1870 been repeatedly verified visually, and more recently by photographic records. The layer comprises an envelope of glowing vapors of an estimated depth of about 600 miles lying at the base of the chromosphere. Its thinness causes the bright lines to appear for but a few seconds, or as a brief *flash*, unless the observation be made at some station near the edge of the lunar shadow. Photographs of this eclipse taken by Willard in Spain, and by Brothers in Sicily, exhibited the corona as divided by the same rifts as shown in Watson's drawing, and, although differing in extent of corona depicted, markedly agreed in all details to be expected in plates exposed for different intervals and in cameras of widely different light-grasp. Incidentally the advantage of large angular aperture in a camera intended to trace the considerable extent of the corona became evident. In photographs by Brothers, at Syracuse, the corona was traceable to a height of at least 40' above the sun's limb.

The eclipse of December 12, 1871, whose path lay across southern India, and northern Australia, was photographed with similar instruments according to a consistent plan by Davis at Baikal, and Tennant at Dodabetta, and these photographs subsequently studied with consummate skill by Ranyard and Wesley, and the delicate results reproduced in detail with masterful accuracy. (Vol. XLL, 'Memoirs Royal Astronomical Society.') Here for the first time was available a representation of the corona in all its complex glory of spaced polar rays, dark rifts, filaments straight, curved, and interlacing, and of stupendous *synclinal* structures with rich nebulous mottling. The delicate portrayal of the wet-plate process was only equaled by the scientific and artistic appreciation of Ranyard and Wesley in integrating the noble results. Double charm and value was added to the photographic achievements by the vivid and accurate descriptions of the corona

ECLIPSE

at Baikal by Lockyer, at Dodabetta by Captain Herschel, and at Shoolor by Janssen. In the spectrum of the corona four hydrogen lines and 1474 K were seen both by Lockyer and Janssen, and in it the latter also found the dark line D and several faint dark lines in the green.

The eclipse of April 16, 1874, was visible only in southern Africa, and observed at Klipfontein by Mr. E. J. Stone, the astronomer royal of the Cape Observatory. He confirmed Young's observation of the reversal of the Fraunhofer lines near the photosphere, and traced the main, green coronal line to more than a degree from the moon's edge. The corona exhibited extended equatorial wings, covering in some parts more than three lunar diameters. The spectroscopic character of the corona, and its unchanged features, as viewed from different stations in Africa, led Stone to insist on the solar origin and cosmical nature of the outer corona.

The eclipse of April 6, 1875, traced its total path across Siam and French Indo-China, and in the former country was observed by Lockyer, Schuster, and Janssen, who obtained photographs of the corona showing that its extent increased rapidly with increasing times of exposure. Photographs were also secured with a prismatic camera which for the upper corona gave apparently H γ , and for the lower parts of the corona, a strong continuous spectrum. The corona was of a type similar to that of the previous year, exhibiting a marked symmetry, and four synclinal groups making angles of more than 45° with the sun's axis.

The path of the total solar eclipse of July 29, 1878, lay diagonally across North America from Bering's Strait to the Gulf of Mexico, and afforded a memorable opportunity to many American and foreign astronomers. The direction of the line of totality across the Rocky Mountains permitted several astronomers to observe the phenomena at extraordinary altitudes. Langley on Pike's Peak, at an altitude of 14,100 feet, traced the corona in the direction of the ecliptic for a distance of at least 12 lunar diameters, and felt great confidence in saying that this, though covering a range of over 10,000,000 miles, was "but a portion of its extent." The eminent astronomer Newcomb, although observing at a lower level, Separation, Wyoming, made his very careful estimate of the length of these coronal wings "as six degrees from the disk." The polar rays and filaments of the inner corona received careful study from such experienced observers as Ormond Stone, Boss, Paul, Trouvelot, and Upton. The dry-plate photographs obtained by Professor Hall's party at La Junta, and by Professor Harkness' party at Creston, were in remarkable agreement as to the details of the inner corona, the same intensities of shading, to great delicacy, being in common, and the pronounced filamentous character of the polar rays, as well as the marked curvature and brightness of the equatorial extensions being clearly shown in both sets of plates. A photograph made by a member of Professor Holden's party by means of a small camera showed the east wing of the corona as extending 50' from the moon's edge. It was the concurrent opinion of many observers that although the corona exhibited vast wings, it lacked, particularly in its inner portions, the brilliancy of the corona of 1869.

As to the spectroscopic observations made by himself and others, Professor Young distinctly announced that they demonstrated a profound modification of the coronal spectrum; the bright lines of former eclipses, especially the 1474 K, having proved to be very faint and difficult of observation. The gaseous corona manifested, as it seemed, a pronounced sympathy and intimate relation with the eleven-year sun-spot period, giving faint spectroscopic lines at the minimum, 1878, and brilliant ones at the maximum, 1869, 1870, and 1871, of the period. Ranyard in his report on this eclipse, inspired by his recent observations and by his former masterful study of previous eclipses, made the deduction that "a greater development of the corona in the equatorial than in the polar regions is one of the characteristics of coronas which have been observed during periods when there were few sun-spots." The search made by Watson and Swift for an intra-Mercurial planet proved to be doubtful in result.

The total eclipse of May 17, 1882, visible in the Sudan, upper Egypt, and across to China, was in Egypt observed by Sir J. Norman Lockyer, Professor Schuster, Professor Tacchini, and by a French expedition equipped by M. Bischoffsheim. The photographs of the corona reproduced the form which it had in 1871, also near a sun-spot maximum, being most extended at points away from the solar equator and with no special structure at the poles. It was thus distinguished from the coronas of 1878 and 1867: near sun-spot minima, which were greatly elongated along the sun's equator and of marked structure at the poles. A striking object was a bright comet near the sun, photographed, as well as observed by the naked eye, and the first discovered on such an occasion. The spectral lines, C, F, D $_3$, H, and K, were observed in the corona. A photograph made by Lockyer with a prismatic camera gave continuous rings corresponding to 1474 K and D $_3$ for the corona. Professor Tacchini, through observations made during the eclipse on the size of the prominences, found that these appeared approximately twice as high and twice as wide at the base as the same prominences had prior to the eclipse, as observed by himself in Egypt, and by Professor Ricco at Palermo.

The eclipse of May 6, 1883, carried the track of the moon's shadow across the south Pacific. It was observed from Caroline Island, an atoll in the Polynesian group, by a number of astronomers from Europe and America. Professor Holden was in charge of the American expedition, and devoted himself to a careful search, during the long totality of 5 minutes 23 seconds, for an intra-Mercurial planet, with a negative result. Palisa of Vienna, assisted by Trouvelot, also engaged in the same search, and with like result. Professor Hastings having under view simultaneously the spectra of the eastern and of the western sides of the corona, observed the green line at beginning of totality as extending brilliantly about 12' from the eastern limb, but fainter and about 4' from the western limb; and at the end of totality these conditions reversed. He also saw the D line dark in the corona. Janssen, devoting himself specially to the detection of the dark Fraunhofer lines in the coronal spectrum, saw not only the principal lines, notably B, b, E, etc., "so marked that there was

ECLIPSE

no possible doubt in that respect," but all told, "about 100 lines." Tacchini observed two lofty, finely silvered sheaves which he designated, *white prominences*, "protubérances blanches." He also thought he had detected the cometary carbon bands in the coronal plumes.

The eclipse of September 9, 1885, was visible on land in New Zealand only, and owing to bad weather yielded scarcely any scientific result. The corona was of a stellate character, the streamers extending in many directions. A brilliant prominence reported as *white* as well as *red* by different observers shot out near the main rift.

The eclipse of August 29, 1886, was visible in its total phase in a path extending from the Isthmus of Panama, across the Atlantic Ocean, and South Africa, to the Indian Ocean. It was observed by American, English, and Italian astronomers in the West Indies. Professor W. H. Pickering, of the Harvard College Observatory, made a valuable investigation in the photographic photometry of the corona, the result of which led Holden to employ a similar method in the two eclipses of 1889. The values obtained are given in connection with the later eclipses. The Harvard photographs of the eclipse were taken with a variety of cameras, the short exposures giving the details of the inner corona, and one, of long exposure, showing the corona as extending 90' from the moon's limb. In the largest prominence of the eclipse, rising in a somewhat spiral form to the altitude of 150,000 miles, W. H. Pickering photographed only H and K lines with a faint trace of an ultra-violet line, while in the other prominences the hydrogen lines also were present. By means of this prominence Tacchini verified his discovery of *white* prominences and immediately announced to the Academy of the Lincei at Rome: "That during a total solar eclipse of the sun there may be seen most beautiful prominences not visible in full sunlight; that the prominences visible only during totality are white, especially in their more elevated parts, and have a special filamentous character, the threads being thin, long, and blunt at the top; that the luminous intensity of the white prominences is feeble, and for this reason they are not visible to the naked eye, unless their height surpass that of the more brilliant parts of the corona; and that the other prominences visible in full sunlight appear much wider and higher in a total eclipse, and,

spectrum showed many lines which on comparison with those of 1882 exhibited a great alteration in intensity. The hydrogen lines were visible in the corona only in the parts overlying strong prominences, while the H and K lines, though elsewhere visible, were stronger on the side of the corona having many prominences at its base. A drawing of the corona by W. H. Wesley, and one of the richest products of this eclipse, is based on seven negatives by Maunder, and five by Schuster, and exhibits a stellate distribution of the streamers.

The eclipse of August 19, 1887, whose line of totality lay across Russia and Japan, was notable for the extensive and complete preparations made to observe it, and for the general failure through cloudy weather. In this disappointment shared Struve's plan of measuring the precise ratio of the apparent lunar and solar diameters by means of a series of co-operative observations along the northern and southern boundaries of the shadow. A comparison of photographs of the corona taken at Petrovsk, Russia, and those taken two hours later at Youmei-yama, Japan, was probably too careless to prove the supposed displacement of one of the streamers.

The total eclipse of January 1, 1889, was visible in a path that lay across California and Nevada, and was successfully observed by many American astronomers. The photographs taken are notable alike for the fine detail of the inner parts of the corona registered, and for the immense extent of the streamers imprinted. A particularly fine negative by Barnard permitted Holden to trace rays similar in typical character to the polar rays all round the limb of the sun and to present a detailed study of the filamentous character of the corona. Professor Holden also drew the conclusion that: "Coronal forms seem to vary periodically as sun-spots and auroræ, and the coronas of 1867, 1878, and 1889 are of the same strongly marked type"; thus confirming Ranyard's previous deduction. Professor Charropin's negatives disclosed the corona out as far as 100' or more, and confirmed many of Barnard's delicate details in the filaments and the trumpet-shaped extension of the outer corona. The outlines of the coronal wings were shown in the photographs of Ireland and Lowden as far as 135' and 165' respectively. Señor Valle was able to trace the streamers, with the naked eye, to a distance of more than three degrees. The coronal spectrum was character-

Photographic Photometry of the Solar Corona	August 1886 Pickering	January 1889 Holden	December 1889 Holden

when of considerable height, have their summits white." Captain Darwin, using an instrument designed by Huggins for testing the possibility of obtaining photographs of the corona at other times than during eclipses, secured negative results. Schuster's photographs of the coronal

ized by simplicity and consisted of few lines other than those of coronium and hydrogen.

The eclipse of December 22, 1889, was observed by Burnham and Schaeberle at Cayenne, South America, and by Father Perry in the Salut Islands, French Guiana. This devoted astrono-

ECLIPSE

mer died, a few days after the eclipse, from the exposure to the dangerous malarial climate. The American and English expeditions at Cape Ledo, Africa, experienced cloudy weather. The main results of the measures in the photographic photometry of the corona made by Professor W. H. Pickering in 1886, and those deduced by Professor Holden from the eclipses of January and December 1889 are based on a standard giving fairly comparable results, and are presented in the preceding table. The photographs of January 1889 are the only ones of the group taken in a clear sky, and this the photometric results clearly indicate.

From a thorough study of his photographs of the eclipse of 1889, Prof. Schaeberle published 'A Mechanical Theory of the Solar Corona,' in which he holds that the "corona is caused by light emitted and reflected from streams of matter ejected from the sun by forces which, in general, act along lines normal to the surface of the sun; these forces are most active near the centre of each sun-spot zone." "The perspective overlapping and interlacing of the streamers cause the observed apparent variations in the type of the corona." From a study of his plates of the eclipse of 1893 he so modifies his theory as to conclude that the stream lines of the corona coincide with "elliptical arcs having one focus at the sun's centre; the origin of the streams being, in the main, confined to the spot-zone regions." Professor Schaeberle applies his theory to the location of half a dozen solar areas productive of the actual streamers photographed in the eclipse of 1893. Whatever the merit of the particular theory, it has had the advantage of pointing out the importance of dynamical and spatial study of the coronal streamers.

The eclipse of April 16, 1893, traced its course of totality from Chile northeast across South America and the Atlantic Ocean into West Africa. It was observed both in Africa and Brazil by English and French astronomers. At Mina Bronces, Chile, Professor Schaeberle, of the Lick Observatory, as Bigelow and Davis in 1889 at Cape Leds, employed a long focus telescope (5 inches aperture and 40 feet focal length) in the photography of the corona. This he set up in the direction of the computed place of the eclipsed sun and obtained notable delineation of the protuberances and the corona near the solar limb. A comet formed a fairly conspicuous feature of the corona on Professor Schaeberle's plates. Professor Hale, from a detailed comparison of photographs of the prominences made in full sunlight by himself at Chicago, and of eyetracings made by Fényi at Kalosa, with those taken during this eclipse by Schaeberle in Chile, and by Fowler at Fundium, Africa, demonstrated the resemblance of the prominences as photographed in the K line to those of the eclipse, and marked differences in those as seen in H α . Professor Hale also indicated that the *white* prominences probably appear so from the intense character of the H and K light. Prismatic cameras of considerable light-grasping power were used by Fowler in Africa, and Shackleton in Brazil, and from a comprehensive discussion of the photographs, Lockyer concluded that the spectrum of the corona in 1893 consisted, besides that of coronium with a wave length of 5303, of at least seven rings of $\lambda\lambda$ 3987; 4086; 4217; 4231; 4240; 4280; and 4486, which had also

been seen in slit spectroscopes in 1886 and at other eclipses. The H and K lines, as well as those of hydrogen and helium, seen hitherto in the corona, by a number of observers, must therefore be attributed to a scattering of the prominence light by the earth's atmosphere, and possibly by the corona itself but not to the intrinsic coronal light. The English photographs also permitted the determination of the wavelengths and intensity of several hundred chromosphere and prominence lines. Abney and Thorpe made photometric observations of the corona which disclosed a close agreement with those made by them in 1886, and indicated a brightness of the corona not dissimilar in both eclipses. Deslandres sought to determine the rotation of the corona by photographing its spectrum on both sides of the sun, but through his use of the H and K lines only, his result, of a speed almost equal to that of the solar surface and corresponding to a distance of 20' from the limb, cannot be regarded as conclusive. De la Baume Pluvinel photographed at least 15 Fraunhofer lines in the coronal spectrum, and thus confirmed Janssen's previous observation. The form of the corona was described by several astronomers as that peculiar to the epoch of the maximum of sun-spots. Bigourdan explored the neighborhood of the sun for intra-Mercurial planets with negative result.

The eclipse of August 9, 1896, was visible in its total phase in Norway, Nova Zembla, and northern Asia. Notwithstanding the unfavorable character of the weather, excellent photographs were secured by Baden-Powell and by several Russian astronomers. The report of Hanksy on the fine photographic results led him to a clear exposition of the relations of the forms of the corona to the sun-spot period, which has won marked attention and approval. His general prediction of the form of the corona of the eclipse of 1900, as made in his memoir, has been verified. Belopolsky adds another dynamical conception of the corona, in that he infers that, by the general eruption at the sun-spot maximum, matter is ejected into the surrounding corona and thus communicates its higher speed of rotation to the outer corona so that gradually the polar regions are laid bare and by the time the minimum sun-spot period arrives the coronal figure has broadened out into vast equatorial extensions. Both Russian and British photographs show some of the prominences with dark borderings or outlines, and in the former these veins suggest the dark interstices of a series of hoods above the prominences. Shackleton, with signal success, photographed the spectrum of the *reversing layer*, and demonstrated the coincidence of many of the lines with the Fraunhofer spectrum. It was thus for the first time that Professor Young's observation was photographically confirmed.

The path of the total eclipse of January 22, 1898, lay across east central Africa, India, and the Chinese empire. The eclipse was successfully observed by many astronomers and furnished a great wealth and variety of photographic material. Campbell, of the Lick Observatory, in the Crocker eclipse expedition to Jeur, India, employed an objective-grating spectrograph which was so arranged as to give a continuous photographic account of the changes in the solar

ECLIPSE

spectrum at second and third contacts. Many interesting results of differences of level and of intensity of radiation in the lines were obtained. An exposure for the coronal ring at $\lambda 5303$ gave it in a very remarkable form which shows its principal masses to lie in the sun-spot zones. Professor Campbell also found that the source of the continuous spectrum of the corona had the same form as the monochromatic ring just mentioned. It is from the results of this eclipse that Campbell, and later Evershed, deduced the wave-length 5303 for coronium, now universally accepted. The British results obtained with the large prismatic cameras permitted Lockyer to give the wave-lengths of 45 coronal rings arranged in three groups defined by the position angle in which they have their greatest brightness. The different forms of the coronal rings seemingly indicate that they are due to at least three substances whose typical wave-lengths are at 5303, 3987 and 4359. A table of wave-lengths of more than 900 lines in the spectrum of the chromosphere resulted from the photographic spectra. With a small prismatic camera Evershed obtained highly valuable results. His spectra gave measured values of 29 of the hydrogen lines closely agreeing with the values computed by Balmer's formula. A remarkable band of continuous spectrum shown by the prominences and lower chromosphere and beginning in the ultra-violet end of the Balmer hydrogen series (see SPECTROSCOPY), he attributes also to hydrogen. In the flash spectrum the position of almost all the bright lines appears to coincide with dark lines in the solar spectrum, but the relative intensities of the lines in the two spectra are widely different. The dissimilarity in the relative intensities of lines of different elements in the two spectra is attributed to the unequal heights to which the gases of the various elements ascend in the chromosphere, and Mr. Evershed hence concludes, that "the wide divergence between the flash and Fraunhofer spectra with respect to intensities, would appear, therefore, to afford no ground for abandoning the original interpretation of the flash proposed by Young from his observation in 1870, and the evidence of these photographs certainly indicates that the flash does in fact represent the upper, more diffused portion of a true reversing stratum." Professor Campbell's Jeur photographs of the corona made with the 40-foot telescope show a great wealth of detail. One of two seconds' exposure, clearly indicates the ultimate relation of the prominences with the synclinal structure of the corona; another, of eight seconds, gives a fine representation of the polar rays and rifts with a coronal form already clearly influenced by the approaching sun-spot minimum. Professor Burckhalter, using a special appliance for regulating the relative exposure given to the inner and outer portions of the corona, obtained a good representation of its entirety, which, however, still showed over-exposure for the inner details. A fine photographic representation of the four principal streamers of the corona was obtained by Mrs. Maunder, which showed them to distances from the moon's centre of three, four, four and a half, and six diameters respectively.

The total solar eclipse of May 28, 1900, will always be famous for its long course through

civilized territory, its path crossing the United States from Texas diagonally to Virginia, and finally threading its way across Spain. It is chiefly memorable for the fine weather which prevailed along the track of totality, and for the magnificent array of optical and physical appliances employed in its observation. The chief American parties were those of the Lick, Yerkes, Allegheny, Smithsonian, Princeton, Brown, Harvard, and United States Naval observatories, conducted respectively under the direction of Campbell, Hale, Wadsworth, Langley, Young, Upton, W. H. Pickering, and S. J. Brown. Long focus telescopes either directly pointed at the sun or fed by cœlostats for coronal photography, huge Rowland grating spectrographs for photographing the flash, and the delicate bolometric appliances of Hale and of Abbot characterized the instrumental attack. The large photographs of the corona by Campbell with telescope of 40 feet focus, directly pointed, by Barnard with lens of 61.5 feet focus, and by Smillie with lens of 135 feet focus, gave a fine representation of the inner corona and prominences. The great prominence in the southwest quadrant was a mass of filaments. Its white summit in eruptive activity was visually observed by the writer. Striking changes in this prominence and in others are seen on comparing the American photographs with those of Christie, the astronomer royal, taken at Ovar, Portugal, and of Lockyer, taken at Santa Pola, Spain, about two hours later. The study of the form of the corona as presented by the photographs was of special interest since Professor Bigelow's precise forecast seemed in the main to be verified when compared with Jewell's fine drawing reproducing the corona from photographs. Already in 1891 Bigelow had computed the direction of the coronal streamers for the corona of 1878 and for the two coronas of 1889 on a "polarization theory" in which the coronal lines were shown to lie in the direction of the lines of force surrounding a spherical magnet. Such magnetization of the sun, although suggested, was then not necessarily assumed. The progress of physical science later made it probable that matter on the solar surface was electrically ionized after the manner of the cathode streams of the Geissler tubes. And these electrified particles, or electrons, required then only to be directed by a supposed magnetic field of the sun. Bigelow's "Magnetic Theory of the Corona," supported by Eberts' experiments, seems likely both from the natural assumptions made, and from the deductions allowable, to furnish the master-key to the mysteriously definite arrangement of the corona at the sun's minimum of activity, so characteristic of the eclipses of 1900 and 1901. The modifications yet necessary to account for all the probable solar phenomena as pointed out by Bigelow, Schaeberle, Scheiner, Ebert, Perrine, Abbot, Arrhenius, Dr. Lockyer, and others cannot be foreseen, but it seems likely that we are rapidly approaching conceptions which will correlate not only all coronal, but all solar phenomena satisfactorily. Professor Burckhalter, by means of his method of regulating the relative exposure of inner and outer parts of the corona, attained remarkable success in photographically depicting the details of the entire corona.

ECLIPSE

The spectroscopic observations were manifold and in the main successful. Professor Frost, of the Yerkes Observatory, operating with a prismatic camera of very high dispersion, and two grating spectrographs, photographed and measured some 800 lines. He regards spectra of the cusps taken within 30 seconds of the contacts, and as produced by the powerful instruments he employed, as valuable as those taken at the precise instant of contact. A red sensitive plate was exposed to the coronal spectrum by Professor Frost, and registered rings at $\lambda\lambda$ 4230, 4341, and 4358. Professor Lord, employing a prismatic camera, obtained excellent photographs of the flash, which enabled him to determine the accurate wave-lengths of several hundred chromospheric lines. Professor Wadsworth's photograph of the flash spectrum by means of a concave grating objective spectroscope of special type induced his thorough investigation of the optical theory of such appliances which ranks among the very choicest results of the memorable eclipse of 1900. Indeed, Wadsworth's masterful discussions are inseparable from the proper estimate of results of previous observers and furnish a trustworthy guide for future spectroscopic work, of a high degree of accuracy, in eclipses. Sir Norman Lockyer, observing in Spain, determined the wave-lengths of many prominence lines and the heights of the various chromospheric vapors. His comparison of the green coronal ring with the inner and outer corona showed that there is no apparent connection between the points of greatest brightness of the coronal rings and the positions of the prominences, and that the brightest parts of the green coronal ring correspond intimately with the brightest parts of the inner corona, but are not in apparent relation with the outer corona. Professor Evershed, observing in Algiers, just outside of the path of totality, obtained photographs of the flash spectrum in high solar latitudes, and concludes that, in its main features, it is the same as in low latitudes. He verifies the essential identity of the flash spectra as photographed by Shackleton in 1896 and those obtained in 1898 and 1900, and infers that "the flash spectrum is probably as constant a feature of the solar surface as is the Fraunhofer spectrum." In discussing the detailed spectroscopic results of the flash layer, Evershed infers that the abnormal intensities of the enhanced lines characteristic of all levels and all latitudes of the flash is due to a continuous circulation of the solar gases in a radial direction, while the cooler, more diffused gases, in their subsidence, determine the character of the absorption spectrum. His final conclusion is "that the flash spectrum represents the emission of both ascending and descending gases, while the Fraunhofer spectrum represents the absorption of the descending gases only." Professor Deslandres, by means of spectrographs with optical parts of Iceland spar and quartz, photographed the entire ultra-violet spectrum of the reversing layer from λ 4000 to λ 3000, the entire ultra-violet spectrum of the upper chromosphere, and the entire spectrum of the corona with two new coronal rings. Deslandres, observing visually with a powerful grating, inferred from the inclination of the green coronal line on the east side of the equator that the corona appeared to have a more

rapid rotation than the disk. He remarked the feebleness of the green line characteristic of minimum solar activity. Professor Dyson, of the Portugal expedition of Christie, the astronomer royal, with spectroscope of quartz lenses and prisms, obtained a fine series of spectra of the sun's limb near the beginning of totality, and spectra of the corona. Professor Turner secured photographs, in polarized light, of the corona, permitting of a quantitative investigation. The polarization of the corona was radial and was "not only shown in the outer streamers, but right up to the moon's limb." An important bolometric measure of the heat of the corona was conducted by Abbot and Mendenhall, of the Smithsonian Observatory, which led to the conclusion that the corona neither reflects much solar light nor in the main gives light of its own on account of high temperature, "but seems rather to be giving light in a manner not associated with a high temperature, or at least with the preponderance of infra-red rays usual in the spectra of hot bodies." This result plainly points to the electrical character of the coronal light and is also in harmony with Bigelow's magnetic theory. Deslandres, using "a very sensitive Melloni pile" for detecting the heat of the corona, reports positive indications which are in strange contradiction with Abbot's results and intensify the regret at the accident which befell Hale's bolometric appliances at the critical moment. The heat measures in future eclipses will have an exciting interest in relation to coronal theory. The shadow bands were perhaps more systematically observed at this eclipse than at any other. The United States Weather Bureau carried out an extensive system of observation from which Professor Bigelow drew the conclusion that "the shadows were crescent-shaped and had a flickering motion, as if struggling through two or more conflicting movements in the atmosphere itself." Professor Elihu Thomson, observing at Barnesville, saw the bands "curved and broken, not complete lines," and immediately after totality, two sets of bands moving in opposite directions "as if due to opposing air currents at different altitudes." As a further confirmation that the bands are due to different air currents, the larger bands were seen to move in the direction of the wind. The different sets of shadow bands are probably produced by the shifting refraction due to the waves of warm and cool air at the different altitudes.

The total eclipse of May 18, 1901, traced its path across southern Madagascar, the Indian Ocean, Sumatra, Borneo, the Celebes and New Guinea, and, on account of its long duration of over six minutes and the high altitude of the sun at the best points of observation, attracted expeditions from the Netherlands, the United States, Great Britain, France, Russia, and Japan. The general weather conditions unfortunately proved to be unfavorable. At a few of the eclipse stations, however, observations of great value were made. Professor Perrine, observing at Padang, Sumatra, through a partly clear sky, obtained excellent results. His photographs showed "conspicuous series of coronal hoods," and also "a remarkable coronal disturbance resembling an inverted cone of considerable angle" and unlike anything previously recorded. This disturbance associated with a long thread-like

ECLIPSE

prominence, Professor Perrine, subsequently, by means of the Greenwich solar negatives taken at Dehra Dûn, India, traced to a sun-spot and associated facule, near the solar limb on the day of the eclipse, and thus plainly exhibited faculæ, prominences, coronal disturbance, and sun-spots in a common origin and intimate relation. This wonderful phenomenon was without doubt due to a solar eruption which took place near the solar limb and at, or just prior to, the time of the eclipse. The spectrographs specially designed and prepared for photographing the delicate Fraunhofer lines of the corona by Professors Campbell and Wright proved very efficient in the hands of Perrine and gave a band of continuous spectrum for the inner corona, 35 Fraunhofer lines between H β and H for the outer corona, and bright H and K lines extending entirely across the moon's disk, as well as 40' east of the sun's limb. The latter indicates clearly that prominence radiation is diffused in the earth's atmosphere. The photographs of Mr. Peters, of the United States Naval Observatory, taken at Fort de Kock, Sumatra, confirm Perrine's results as to the formation of hoods or envelopes above some of the prominences, and are replete with structural detail. The corona, according to Perrine's photographic negatives, was polarized in the portions 10' beyond the solar limb in all position angles including the polar regions. In negatives of the English astronomer, Newall, some of the streamers showed greater extension in the polarized than in the unpolarized light.

The spectroscopic results of this eclipse were not unimportant. Dr. Humphreys used a concave grating of 30 feet focal length without slit or lens and was able to present accurate wavelengths of nearly 400 lines in the chromosphere, assign their intensity and character, and identify the substance in most cases. Hydrogen, helium, and the H and K light, generally attributed to calcium, but by Trowbridge to oxygen, gave arcs showing a height 34", or greater than the solar diameter. Humphreys' investigations point to "a very extensive distribution of the elements in the chromosphere with no narrow separating boundaries producing distinct layers of any kind," and show that "in general the heavier and, only the heavier, Fraunhofer lines appear as bright lines in the flash, and that the relative intensities in the two cases are roughly comparable." Dr. S. A. Mitchell, using a Rowland flat grating of 15,000 lines per inch and a quartz lens, secured measures on some 480 bright lines for the flash at third contact. The theory of Sir Norman Lockyer that lines stronger in the spark than in the arc spectrum, known as "enhanced" lines, are found in the spectrum of the chromosphere, has been critically examined by Dr. Mitchell, by means of the spectroscopic data furnished by his photographs, and he concludes, "From these comparisons it would seem that there is no close connection between 'enhanced' lines and the bright lines of the chromosphere seen in the flash." In the special work on the corona contemplated by Professor Barnard's long exposure of a very large plate, and by Dr. Abbot's second attempt to measure the coronal heat bolometrically, there was universal interest among astronomers and universal regret at the compulsory postponement to a future eclipse on account of the clouds. A

photographic search for an intra-Mercurial planet was conducted by Perrine using four lenses covering a stretch of 19° on either side of the solar equator. The faintest stars on the plates range from 6.5 to 9.3 visual magnitude, and Perrine infers that "unless at the time of the eclipse the planetary bodies were directly in line with the sun or with the brightest portion of the corona, there is no planetary body as bright as 5.0 visual magnitude within 18° of the sun, whose orbit is not inclined more than 7¼° to the plane of the sun's equator."

Bibliography.—The general theory of eclipses and the methods for their computation have been developed by Bessel in the 'Astronomische Nachrichten,' Nos. 151 and 152, but with the utmost rigor in his 'Astronomische Untersuchungen,' Vol. II.; and by Hansen in 'Astronomische Nachrichten,' Nos. 339–342, and in complete treatment in 'Abhandlungen der math., phys. Classe der Königlich Sächsischen Gesellschaft der Wissenschaften,' Vol. IV. The most reliable general tables for the computation of eclipses are those of Newcomb, 'Astronomical Papers of the American Ephemeris,' Vol. I. Oppolzer's 'Syzygientafeln für den Mond' (Publication der Astronomischen Gesellschaft, XVI.), and his 'Tafeln zur Berechnung der Mondesfinsternisse' (Denkschriften der K. Akademie der Wissenschaften zu Wien, Vol. XLVII.), are based on Hansen's 'Lunar Tables' and are employed in the production of that rich storehouse of eclipse knowledge: Oppolzer, 'Canon der Finsternisse,' published as Vol. LII. of the 'Denkschriften' of the Vienna Academy. It contains the elements of 8,000 solar and 5,200 lunar eclipses occurring between the dates —1207 Nov. 10 (Julian) and 2161 Nov. 17 (Gregorian), and the accompanying charts show the approximate path of each eclipse on the earth's surface. A valuable accessory to Oppolzer's 'Canon' is found in Dr. R. Schram's 'Tafeln zur Berechnung der näheren Umstände der Sonnenfinsternisse,' published in Vol. LI. of the Vienna 'Denkschriften.' Dr. Eduard Mahler, in Vol. XLIX. of the Vienna 'Denkschriften' has published valuable elements and tables entitled 'Die Centralen Sonnenfinsternisse des XX. Jahrhunderts.' Ginzel, in the 'Sitzungsberichte' of the Vienna Academy, LXXXV., LXXXVII., and LXXXIX., and in his 'Spezieller Canon der Finsternisse,' published by the Berlin Academy, has brought together a large array of references to ancient eclipses, and compared them with computation. The papers of Airy, Williams, Maguire, and S. J. Johnson in the 'Monthly Notices' of the Royal Astronomical Society are of interest. The physical data and problems of total solar eclipses are treated in a vast modern literature mostly issued by the observatories and learned societies. A highly important compend of physical information concerning total solar eclipses is that of Ranyard, 'Memoirs of the Royal Astronomical Society,' Vol. XLI. For the later eclipses the most valuable discussions are to be found in the publications of the United States Naval, Harvard, Lick, Yerkes, and Smithsonian observatories, in the 'Astronomische Nachrichten,' the 'Memoirs,' and the 'Monthly Notices' of the Royal Astronomical Society, and in the 'Astrophysical Journal.'

MONROE B. SNYDER,

Director of the Philadelphia Observatory.

ECLIPTIC—ECSTASY

Eclip'tic, in astronomy, the sun's path, the great circle of the celestial sphere, in which the sun appears to describe his annual course from west to east. The Greeks observed that eclipses of the sun and moon took place near this circle; whence they called it the *ecliptic*. The sun does not always rise to the same height in the meridian, but seems to revolve round the earth in a spiral, and is in the equator twice a year, about 22 March and 22 September. The points of the equator at which the sun is stationary on these days are at the intersection of the equator with the ecliptic. On 21 June the sun reaches its greatest height in the heavens, and 21 December it descends the lowest. The ecliptic, like all circles, has two poles, which move about the poles of the earth every 24 hours, and in this manner describe the polar circles. What appears to be the path of the sun, however, is in reality the path of the earth. The planets and the moon revolve in different planes; but these are inclined at only a very small angle to the plane of the ecliptic; hence these bodies can be but a small distance from the ecliptic. The plane of the ecliptic is very important in theoretical astronomy, because the courses of all the other planets are projected upon it and reckoned by it. By the obliquity of the ecliptic we understand its inclination to the equator, or the angles formed by the planes of these two great circles. This angle is measured by the arc of a third great circle, drawn so as to intersect the two others perpendicularly, in the points at which they are farthest apart. The ancients endeavored to measure the obliquity of the ecliptic. According to Pliny, it was first determined by Anaximander; according to Gassendi, it had been ascertained by Thales. The most celebrated measurement of this obliquity in ancient times was made by Pytheas, at Marseilles. He found it, 350 B.C., to be $23^{\circ} 40' 23''$. A hundred years later, according to Ptolemy, Eratosthenes found it to be $23^{\circ} 51' 20''$. Various measurements have subsequently taken place, even down to our own time; and it is remarkable that almost every measurement makes the angle less than those which preceded it. See DAY; NUTATION.

Eclogite, *ĕk'lō-jīt*, or **Eklogite**, a crystalline rock composed of the grass-green amphibole called smaragdite, and red garnet. Another variety of eclogite is composed of omphacite, a grass-green granular variety of pyroxene, and garnet. Eclogite is not an abundant rock; it is usually associated with the older crystalline schists, but as a rule is not itself schistose. It is found in Norway, Greece and in parts of the German empire.

Eclogue, *ĕk'lōg*, in poetry, the name is given to poems of the same form; thus the satires of Horace were called eclogues. Since Virgil's *Bucolics* received this name (from grammarians probably, and not from the poet), the term eclogues has usually been applied to what Theocritus called *idyls*—short, highly finished poems, principally of a pastoral nature. See IDYL.

Ecole des Beaux Arts, *ā-kōl dā bō-zār*, (School of Fine Arts), the French government school in Paris, founded by Mazarin in 1648, and provided with an extensive staff of teachers. The competitions for the *grands prix de*

Rome take place at this school. All artists between the ages of 15 and 25, whether pupils of this school or not, may compete, after passing two preliminary examinations. The successful competitors receive an annual allowance from the state for three or four years, two of which must be passed at Rome.

Ecology. See BIONOMICS; PLANT GEOGRAPHY.

Economic Association, American, organized 1885 for the encouragement of economic research, the publication of economic monographs and the encouragement of perfect freedom of economic discussion.

Economic Development of the United States. See UNITED STATES—ECONOMIC DEVELOPMENT OF THE.

Economic Entomology. See ENTOMOLOGY, ECONOMIC.

Economics. See POLITICAL ECONOMY.

Economists, a name given to certain French writers of the 18th century, who maintained that agriculture is the only fountain of wealth, and therefore clamored for a land tax. Persons versed in the science of political economy, as Malthus, an English economist. Also applied to officers in some cathedrals in the Church of Ireland, who are appointed to manage the cathedral fund, to make payments, etc.

Economy, Pa., village in Beaver County, on the Ohio River, and Pittsburg, Ft. W. & C. R.R.; 20 miles northwest of Pittsburg. The first settlements were made by a colony of "Harmonists" who had formerly lived in Pennsylvania, then moved to Indiana, but returned and founded Economy in 1825. Pop. 1,062. See HARMONISTS.

Ecrevisse, *ā-křev-ēs*, **Peter**, a Flemish novelist: b. Obbicht, Limburg, 1804; d. 1879. In 1860 he withdrew from a promising political career and devoted himself to literature. He is noted for his power of description and his simple earnest style. Among his numerous historical novels may be mentioned: 'The Destruction of Maestricht'; 'The De Witt Brothers.' He was author also of some novels of society: 'The Cancer of Cities'; 'The Stepson'; 'The Servingman of Kempen.'

Ecrévisse. See CRAYFISH.

Ec'stasy, a state of consciousness, in which the natural powers or faculties are transcended by absorption in a fixed object or idea beyond normal cognition. In its theological aspect the term ecstasy is generally used as equivalent to rapture. Distinction should be made between true religious ecstasy and its simulations. Saint Thomas Aquinas, the great theologian of the Middle Ages, says that it may arise from three causes; first, bodily, as when a person is alienated from his senses by disease; secondly, it may be preternatural, as when it is wrought by the agency of devils; and lastly, and this is the case of true religious ecstasy, when it comes from the Spirit of God. Many instances of this latter are recorded in the Old and the New Testaments, and we also have accounts of this supernatural phenomenon in the lives of the Saints. Mystical writers describe this state as the complete suspension of the senses, the body being, as it were, dead, while the will, as Saint Teresa points out, retains its full power and is completely absorbed in God. Ec-

ECTHYMA—ECUADOR

stasy arising from disease is described in the terms of modern science as a "condition of the nervous system and mind characterized by immobility, suspension of normal sensory and motor functions, and rapt concentration upon a limited group of ideas." There is little question but that ecstasy of this latter kind is a manifestation of the hysterical temperament. It is closely allied to hypnotism, catalepsy, trance, etc. Consult Maudsley, 'Pathology of Mind'; Tuke, 'Dictionary of Psychology'; Janet, 'Mental State of Hystericals'; Baldwin, 'Dictionary of Philosophy and Psychology' (1901); Mantegazza, 'Estasi Umane' (1887); James, 'Varieties of Religious Experience' (1902).

Ecthyma, ĕk-thí'ma, a complication of a number of general disorders manifesting itself as a form of pustular inflammation of the skin, particularly distributed on the extremities, the lower especially, the neck and trunk also often being affected. As a rule the affection begins as a small pimple which takes a rounded outline unless scratched. This pimple develops into an ulcer which is covered over with a thick dark crust. The ulcer heals slowly and there is a small scar resulting. The development of the disease is slow, usually running a fortnight, and the pimple may be single or appear in crops. There is burning and pain. The common cause of ecthyma is diminished bodily resistance, such as is found in starvation or in syphilis, tuberculosis, diabetes or anæmia. The common organisms causing the actual pustulation are streptococcus and staphylococcus. The initial injury is often brought about by scratching due to the bites of some house-pests, or the itching of diabetes, or senile itching, or some form of local skin irritation. Soap and water, good food, and antiseptic dressings, such as hydrogen peroxide, nitrate of silver, and sulphur ointment, are usually sufficient, with proper general hygiene, to bring about a cure.

Ec'toderm. See EMBRYOLOGY.

Ectozo'a, animals parasitic on the outside of living bodies, as distinguished from *Entozoa*, animals parasitic within them. Both terms are general and have no taxonomic significance.

Ectro'pion, or **Ectropium**, a Greek term meaning an everted eyelid, a turning outward; an abnormal eversion of the eyelids.

Ecuador (properly, *La República del Ecuador*: The Republic of the Equator), a country of South America. According to the claims of its own government, it is bounded on the east by Brazil, extending from the Pacific Ocean, at lon. 82° 55' W., to lon. 72° 12' W., and from lat. 1° 50' N. to lat. 5° 30' S., but nearly all of the region east of the Andes is claimed by Peru, and the boundary with Colombia is also in dispute (see COLOMBIA). Therefore, it is bounded on the north and northeast by Colombia, and on the southeast and south by Peru, according to the adverse views entertained by those competing governments. The area in its actual possession is about 120,000 square miles; the total area, if we include disputed territory and the archipelago of Galápagos, is nearly 276,000 square miles.

Political Divisions.—The country is divided into 16 provinces (counting as one the undefined eastern region), as follows: (1) Province of Pichincha, including the *cantones* of Quito, Cay-

ambe, and Mejía. Its chief town, also capital of the republic, is Quito, with 80,000 inhabitants: seat of the central government, the archbishopric, the university, the supreme and superior courts, etc. (see below, *Judiciary*), headquarters of army corps, general commanding district, and superintendent of police. Quito's principal buildings and institutions are: The palaces of the president, of the archbishop, of the government, of the School of Arts and Trades, and of justice; city hall, university, three seminaries, astronomical observatory, Institute of Sciences, Medical School, two chemical laboratories, two museums of natural history, two botanical gardens, 33 churches with convents, six additional convents, four colleges, three schools for young women (116 schools in the canton), five public libraries, six asylums, two houses of refuge, two houses of correction, five cemeteries, four barracks and an arsenal, two public promenades, five squares with statues, the Sucre Theatre (which holds 2,000 spectators), and two banks. There are 16 journals. Industries of the province are: cattle- and sheep-raising, manufacture of cloth, candles, cheese, chocolate, etc. There are 22 mills. The embroideries and laces made by the women of Quito are famous. The city, built on the flank of the mountain which gives its name to the province, has beautiful suburbs: thanks to its elevation above sea-level (9,250 feet), the climate is temperate. The Alameda is a fine park, planted with oaks, eucalyptus, and other large trees. (2) The province of Carchi: principal town Tulcan (5,000 inhabitants), residence of the governor, police commissioner, commander of the military force of province, and municipal authorities. Industries are: cattle-raising and the cultivation of cereals in the higher and middle (temperate) regions. The products of the lowlands are sub-tropical—sugarcane, etc. (3) The province of Imbabura. Its chief town, Ibarra, which was destroyed by the earthquake of 1808, has now 5,000 inhabitants. It is the residence of a bishop, in addition to the civil and military authorities located in every province—those mentioned under Carchi. Principal buildings are the palace of the government, Roman Catholic schools, churches, and convents. Products of the region are cereals, sugarcane, cotton, and cattle. (4) Province of León: its principal town, Latacunga, has 12,000 inhabitants. Products are as given in 2 and 3; there are also potteries. The highest active volcano in the world, Cotopaxi (19,614 feet) is in this province. (5) Province of Tungurahua: the principal town, Ambato, has a population of 8,000. Special products of the region are wine, porcelain, and hats. It includes the Tungurahua volcano. (6) Province of Chimborazo, with five *cantones*. The principal town, Riobamba, which was destroyed by an earthquake in 1799, has 12,000 inhabitants. A leading product is cinchona, or Peruvian bark. The mountain which gives its name to this province is often called "the king of the Andes," though it is not equal to the highest peaks in Bolivia. (7) Province of Bolívar, a salt-producing region; chief town Guaranda (6,000). (8) Province of Cañar, with gold-mining as one of its industries; principal town Azogues (4,000). Ruins of a palace dating from the period of Inca supremacy are found in this province. (9) Province of Azuay: its principal city, Cuenca (q.v.), with 30,000 inhabitants, is a centre of literary

ECUADOR

and artistic life in the republic. (10) Province of Loja: its principal town, also called Loja, has 10,000 inhabitants. This province adjoins Peru, and its boundary with that country is disputed. It contains the ruins of the palace of Villamarca. (11) Province of El Oro, which has gold mines at Zaruma, and produces cacao and coffee on the lands along the Pacific coast. There are also fisheries. Chief town Machala, with 3,200 inhabitants. (12) Province of El Guayas, of which Guayaquil (pop. 60,000) is the commercial metropolis. The local authorities are: the governor, bishop, municipal council, general commanding the troops of the district, chief of police, justices of the superior court and judge of commerce, the consular corps, and the superintendent of the custom-house. Noteworthy buildings or institutions are: the city hall, palaces of the governor, bishop, and commanding general, cathedral, seminary, nine churches, several chapels, municipal library, civil and military hospitals, schools of medicine and law, university, chemical laboratory, national college, a ladies' philanthropic society, a school of arts and crafts, Convent of the Sacred Heart School for Young Women, orphan asylum, Olmedo Theatre, circus, etc. There is a statue of the poet Olmedo in the avenue which bears his name, and an equestrian statue of Bolivar in Seminario Park. A dozen newspapers are published in the city. Products of the region are: cacao, coffee, sugarcane, cereals, cotton, rubber, vegetable ivory or corozo, construction and cabinet woods, articles manufactured with sugar, tropical fruits, cattle, horses and mules, tobacco, beer, artificial ice, and mineral waters, chocolate, liquors, alcohol, soap, candles, hats, hammocks, and several varieties of fish. There are two banks of issue and a savings bank, four clubs and German and Spanish casinos. Guayaquil was partly destroyed by fire in 1896, but has been rebuilt. It has improved in appearance, and perhaps also in the matter of sanitation; yet it has not a good reputation for healthfulness. The climate is very hot. The city is lighted by gas, and has potable water, the source of supply being in the cordillera. (13) Province of Los Rios: its chief town, Babahoyo, has 3,000 inhabitants. (14) Province of Manabi; principal towns Portoviejo (5,000) and Jipijapa (6,000). The finest of the so-called "Panama" hats are made exclusively in Ecuador, especially in Jipijapa. Other products of this region are sarsaparilla, vanilla, and pearls from a small island. (15) Province of Esmeraldas, where tobacco is grown that is comparable with the Cuban product. Population of the chief town, also called Esmeraldas, about 6,000. (16) The vast, insufficiently explored Oriental province, with settlements at Napo, Archidona, Tena, and Canelos, and Indian tribes, the Jibaros, etc. A governor and chief of police represent the authority of the republic. Chapels have been built, and missions established. The soil is supposed to be uncommonly fertile, and it is watered by large rivers. (17) Galápagos Archipelago (q.v.), now called the Archipelago of Colón by some Ecuadorian writers who wish to create the impression that it is an attractive field for immigration. It was formerly a penal settlement, and was especially used as a place of banishment for political offenders. The population of Chatham Island was said to be about 2,000 in 1900; the other islands are nearly uninhabited. The authorities

are the territorial governor, a priest, and a military commander. Products: the giant tortoises (Spanish, *galápagos*), whalebone, etc.

Topography and Physical Geography.—The cordilleras of the Andes traverse Ecuador, running nearly north and south, with elevated plains between the eastern and western mountains—some of the latter forming a sequence that has suggested to geographers two parallel chains; and it is, indeed, true that the eastern and western limits of the broad band of Ecuadorian upland roughly parallel each other. (See *CORDILLERAS*.) There are four facts of special interest: First, Though we do not find here the highest single peaks in the world, or even in South America, there are nowhere else so many peaks of very great height, forming a group. Second, their equatorial situation gives to these masses of granite, gneiss, schist, trachyte, porphyry, and volcanic detritus wholly exceptional contrasts in temperature (see below, *Climate*). Third, this region has been in the past, and is probably today, more subject to volcanic disturbances than any other in South America. Fourth, as an offset to the group of high peaks, the Andean ridges sink downward, forming the lowest pass that exists at any point between Colombia and the southern end of the continent. The principal rivers of the lowlands of western Ecuador, running from the central region of mountains and high plains to the Pacific, are the Guayas and the Esmeralda. The former empties into the Gulf of Guayaquil, one of the best harbors on the western coast of South America. In the eastern lowlands, the Napo and its tributaries belong to the Amazon River-system.

Mineral Resources.—Salt, mineral pitch, and gold are produced. The Zaruma mines, province of El Oro, were reported as being worked on an extensive scale in 1903. That district contains numerous gold-bearing quartz veins, which were worked by the Spaniards 100 years ago.

Climate.—The mean temperature of the coast at Guayaquil, etc., is 28° C.; that of the interior ranges from 35° C. in the lower valleys to 18° or even 10° C. on the plateaus, according to the altitude. The lower slopes of the mountains are torrid; the highest crests are snow-clad. The climate of the capital is temperate and spring-like throughout the year, with little variation, and it is said to be one of the best in the world for the cure of tuberculosis. (See also *CUENCA*.) There are two seasons only, the rainy and the dry.

Agriculture.—The cultivated area is limited, owing to the lack of laborers; nevertheless Ecuador produces more cacao than any other country, and not a little coffee. These products, with sugarcane and tobacco, are found in the lowlands of the coast and Amazon basin; cereals and vineyards in the elevated valleys. (See also *Political Divisions* for products of the different provinces.)

Exports and Imports.—In 1901 the total value of exports was 16,392,333 *suces*, and the total value of imports for the year 15,126,281 *suces* (value of *sucre*, \$0.487). On the import list of the country the United States ranks first, Great Britain second, and Germany third. Imports from the United States in the fiscal year 1901 were valued at \$2,015,085; exports to the United States \$1,424,840. Shipments of cacao from Ecuador in 1901 amounted to 23,179,095 kilograms, showing a marked increase over those

2. A Pass in the Andes; Guayaquil and Quito Railway.

ECUADOR

of 1900. Ecuador exported in 1900 through the port of Guayaquil 1,733 tons of coffee, with a value of \$121,500. Imports are: cloth (cotton, woolen, silk), foodstuffs, boots and shoes, oils, alcohol, wines and liquors, beer, mineral waters, preserved and fresh fruits, and live-stock.

Railways, etc.—Sixty miles of the railway from Guayaquil to Quito were built before 1880, that is, from the coast to the village of Chimbo, at the base of the cordillera. There the enterprise was checked by the difficulties of construction. A company organized in the United States undertook to complete the road, and by 1903 had succeeded in laying rails from Chimbo to Guamote, on the plateau, a distance of 58 miles. There are 1,221 miles of telegraph, with 50 offices. The Ecuadorian landing-station of the Central and South American Telegraph Company's cable is at Salinas, which was declared open as a minor port by executive decree 21 Aug. 1902. Quito and Guayaquil have telephone services; the latter a street-car system. The mails are carried twice a week to all parts of the republic; to foreign countries once a week. Twenty passenger steamers ply on the Guayas River, and between Guayaquil and the other coast towns. English steamships of the Pacific line, and vessels of the Chilean line plying between Valparaíso and Panamá call regularly at Guayaquil.

Banks.—(At Guayaquil and Quito: see *Political Divisions*.)

Government.—Congress meets at Quito every two years, usually on 10 Aug., for 60 days. There are two chambers: the senate (two senators from each province; term, four years) and the chamber of deputies (one deputy for each 30,000 inhabitants; term, two years). Both senators and deputies are elected by direct popular vote. Eleven constitutions have been promulgated since 1830; that of 12 Jan. 1897 is now in force. The president and vice-president of the republic are elected for four years by direct vote of the people; they cannot be re-elected until eight years have passed after expiration of their terms of office. The president cannot go out of the country, either during the continuance of his functions or for a year after they have ceased. There were formerly five ministries, but the number has been reduced to four, namely, those of the interior, police, and public works; foreign relations, public instruction, justice, and worship; finance; and war and navy. The council of state is a body composed of the vice-president of the republic, the ministers, two officials of the law courts, the rector of the university, two senators, two deputies, and two citizens not holding other office. Governors of provinces are agents of the executive, appointed by the president; agents of the governors are the "political chiefs"; and agents of the latter are "political lieutenants," one for each parish, who have the rural authorities under their charge.

Finances.—The budget for 1902 showed the following sources of revenue for the government: customs 9,640,700 *sucre*s (the chief items being, duties on imports with surtax 6,400,000, and duties on exports with surtax 1,800,000 *sucre*s); receipts from industries controlled by the government, that is, salt and powder, 450,000 *sucre*s; sundry taxes 2,868,804.25; public lands, etc., 423,000 *sucre*s; and leases 36,000 *sucre*s. Disbursements were: congress 111,780 *sucre*s; the president of the republic 43,632 *sucre*s; the

vice-president 9,600 *sucre*s; council of state 1,500 *sucre*s; department of interior, police, and public works 3,603,168 *sucre*s; department of foreign relations, etc., 2,168,034 *sucre*s; department of finance 2,821,694.32; department of war and navy 3,691,502.18; additional public works 1,068,802.80 *sucre*s. Total disbursements 13,319,764.30; surplus 98,739.95 *sucre*s. The foreign debt, chiefly a relic of loans contracted by the old republic of Colombia, at the time of the union of Ecuador, Venezuela, and New Granada, was approximately \$3,355,000 in 1901; the internal debt is much larger. The gold standard has been adopted in accordance with the law of 4 Nov. 1898.

Army and Navy.—In time of peace, the army consists of: infantry, about 3,690 men; artillery, 1,362; cavalry, 468; national guard (on paper), 95,329. The national guard includes companies of firemen—organizations which are especially numerous and influential in Guayaquil. The naval vessels are, one torpedo boat and a transport.

Population.—The boundaries of the republic being in dispute, and a large part of Ecuador's claim being unexplored territory, estimates of the total number of inhabitants vary, naturally. The Ecuadorians usually say about 1,500,000, including uncivilized Indians.

Education.—Primary instruction is gratuitous and obligatory for children between 6 and 12 years of age. Among the subjects taught, beside the familiar elementary branches, are morality and religion, and urbanity. In the boys' schools the constitution of Ecuador is added; in those for girls, sewing and domestic economy. In 1900 there were more than 80,000 pupils in the public schools, as compared with 47,913 in 1885. The number of schools increased from 789 in 1885 to nearly 1,250 in 1903. Secondary instruction is provided in 37 "colleges," with 371 professors and 4,500 students; the school year beginning 10 October and ending 30 July. The university at Quito—with associate universities at Cuenca and Guayaquil, has faculties of philosophy, belles-lettres, law, medicine, physical and natural sciences, mathematics, and agriculture. An officially authorized publication states that "a large number of primary and secondary schools have been confined hitherto [before 1900] to the religious orders, who have acquitted themselves of their task with zeal and success." Schools of arts and crafts are found in the provinces of Pichincha, León, Chimborazo, Azuay, Loja, and Guayas. Bahia has a commercial school.

Literature.—José Joaquín de Olmedo (b. Guayaquil 1780) and Juan Montalvo (b. Ambato 1833) are esteemed by loyal Ecuadorians, the former the greatest poet, the latter the greatest prose writer, of South America. Ecuador was also the birthplace of José Mejía, the "American Mirabeau," and of many historians, theologians, poets, romancers, and critics whose works are as highly regarded in Spain as in America. The Ecuadorian Academy (founded 1875) is the chief of the literary associations of the republic. Liberty of the press is guaranteed by the constitution. In painting and music the progress is less noteworthy.

Judiciary.—Ecuador's courts are: the supreme court, at Quito (five justices, attorney-general, two secretaries); superior courts at Quito, Guayaquil, Cuenca, Riobamba, Loja, and

Portoviejo; court of account, at Quito (seven judges); municipal civil tribunals of the first instance at Quito, Guayaquil, and Cuenca; fiscal judges for each province; judges of commerce in large towns; judges of mines, police, and parishes. In criminal cases, trial by jury is provided for, but only in the larger towns.

Local Government.—This is controlled, as we have shown, by the central government. Chief towns of *cantones* have municipal councils, commonly of five members. There are rural (mounted) and urban police, with a director or chief in each provincial capital.

History.—The Quito Indians, who held the country near the present capital, were conquered, perhaps in the 10th century, by a more warlike race led by chiefs called Scyris. These in turn yielded to the Incas of Peru. On the death of Inca Huayna-Capac, the empire was divided between his two sons, Atahualpa and Huascar. The former, whose mother was a Scyri princess, revived the Quito kingdom; Cuzco and the southern empire were given to the latter. War broke out between the brothers shortly before the Spaniards under Francisco Pizarro arrived upon the scene, and this civil strife made possible the conquest of a great nation by a handful of adventurers (see Cuzco and PERU). Benalcazar, the famous Spanish captain, completed the conquest of the Scyri kingdom, and seized the city of Quito (1534). Between 1564 and 1820 this region was administered as a presidency; and 36 presidents exercised authority there as representatives of Spain before the series of "presidents of the republic" began. Quito's first demonstration in favor of independence, 10 Aug. 1809, was quickly and savagely repressed; Guayaquil was more fortunate in her belated attempt (9 Oct. 1820). A campaign which resulted in the capture of Quito, after the battle of Pichincha, was organized by a triumvirate whose members were the poet José Joaquín de Olmedo, mentioned above, the merchant, F. Roca, and the soldier, Rafael Jimena. The battle of Pichincha was won for the patriots by the Venezuelan general, Antonio de Sucre, Bolívar's lieutenant: the territory thus liberated was naturally drawn into the Colombian federation, which Bolívar dominated for a time (see COLOMBIA). In 1830, after the dissolution of that greater Colombia, Ecuador was constituted as an independent republic. The convention of Riobamba placed Gen. Juan José Flores at the head of the government. His successor (1835-9) was Vicente. Flores was again in power from 1839 to 1845, and, with the approval of many partisans, tried to secure a much longer term and dictatorial powers. A second triumvirate, composed of Olmedo, Roca, and Noboa, carried on the government until a convention was held at Cuenca. This convention elected Vicente Ramón Roca, who served as president from 1845 to 1849. Vice-President Acásubi assumed the presidency when congress and the country could not agree upon a candidate; the country, however, continued to be disturbed until 1851, when Diego Noboa was chosen by a constituent assembly. In the following year he was displaced by Gen. José María Urbina, at the head of a successful revolution. Urbina was president until 1856. Slavery was abolished during his term. Gen. Francisco Robles followed (1856-9). During the next two years the country had a varied experience:

war with Peru, the dictatorship of Gen. Franco, and the provisional government of Gabriel García Moreno. The convention of Quito elected García Moreno to the presidency (1861-5). Jerónimo Corrión, elected in 1865, retired in 1867. Javier Espinosa served from 1868 to 1869. García Moreno, as the leader of an insurrection, took office again (1869-73), and in 1873 secured re-election by the use of force. He was assassinated 6 Aug. 1875. Antonio Borrero, his successor, was driven from office by Gen. Ignacio de Veintemilla in 1876. After the expiration of the legal period, President Veintemilla made himself dictator. José María Placido Caamaño was president from 1884 to 1888; Antonio Flores from 1888 to 1892; Luis Cordero from 1892 to 1895—when he resigned to put an end to bloodshed. Gen. Eloy Alfaro, at first "supreme chief," was legally elected in 1897. Gen. Leonidas Plaza succeeded him in 1901.

Bibliography.—American Republics, International Bureau of the, 'Monthly Bulletin,' Washington, 1902-3; Cevallos, 'Geografía del Ecuador' and 'Resumen de la historia de Ecuador'; Church, 'Ecuador in 1881: Report to United States Government'; Prescott, 'Conquest of Peru'; 'République de l'Equateur et sa participation à l'Exposition Universelle de 1900'; Velasco, 'Historia del Reyno de Quito' (3 vols. Quito 1841-4), and a French translation of that work in H. Ternaux Compans' 'Voyages, Relations, et Mémoires Originaux.'

MARRION WILCOX.

Eczema, čk'zě-ma, an acute or chronic disease of the skin, showing a vast variety of changes in the skin itself, and accompanied by intense itching, burning, or pain. The changes in the skin at first are usually marked by redness, papules, then small vesicles or pustules which later become crusted and dry; or the surface is weeping. Infiltrated and scaly patches are common. All of the different forms of eczema (and no less than a dozen varieties are described by skin specialists) have certain definite changes occurring in the skin. There is usually swelling, congestion, and increase of temperature locally. There is almost invariably an exudation of fluid into the tissues, with the formation of vesicles and pustules, as described. There is further a certain amount of plastic exudation which produces in the skin papulous areas that are thickened and infiltrated. Finally there are the subjective symptoms of itching, which may be only a slight tingling or prickling sensation, or may be so intense as to demand continued and deep scratching, until bleeding or oozing takes place. This itching is, as a rule, intermittent in character, being almost invariably worse at night when the patient is covered, the heat of the body causing the aggravation. Sometimes exposure to cold brings about intense itching. The disease usually runs an acute course, and may be limited to one region of the body, or may be general. Its general tendency is to progress rather than to get well. It is perhaps one of the most obstinate of all skin diseases, and at the same time one of the most difficult to diagnose and to treat. The treatment of each case is a particular study. Sometimes the disease is beyond the power of the best skin specialist. At other times corrections of minute errors in diet will bring about cure. So far as household remedies are

concerned, only those that can relieve the itching are deserving of notice in this place. One of the best of these is carbolic acid in weak solution—two to three per cent. This may be applied on a bit of absorbent gauze. Special care being taken not to enclose a particular part completely with the weak carbolic acid. Bland non-irritating powders such as calamine and oxide of zinc are often useful. When the disease becomes chronic it is apt to be extremely obstinate.

Edam, ɛ'dām, Holland, town 12 miles north-northeast of Amsterdam, and about a mile from the western shore of the Zuyder-Zee, with which it is connected by a canal. This place is chiefly noted for its trade in cheese, of which nearly 1,000,000 pounds are annually sold in its market. (See CHEESE.) The town was once fortified, and has still a wall with seven gates. Pop. 6,444.

Edar, India, a Rajput state of Guzerat in the Mahi Kantha agency, tributary to the Guicowar of Baroda, and subject to the political superintendence of the presidency of Bombay. It has an area of about 4,966 square miles, and an estimated population of 260,000. Its capital, a picturesque town of the same name, contains 6,300 inhabitants.

Edda, ɛd'a (Icel. meaning "grandmother"), a name given by Bishop Brynjulf Sveinsson to a volume containing the system of old Scandinavian mythology, as being the mother or source of all Scandinavian poetry. It was originally compiled by Sæmund, a Christian priest in Iceland, who died 1133, and contained poems and chants of a mythic, prophetic, and religious character. A prose synopsis of these poems was made by Snorri Sturleson, an Icelander (b. 1178), a pupil of the grandson of Sæmund, who was court poet in Norway. He was assassinated in 1241, on his return to Iceland. The portion of the book compiled by Sæmund is known as the 'Elder' or 'Poetic Edda,' and the continuation of Sturleson as the 'Younger' or 'Prose Edda.' Translations of both books are found in English, German and French. See ICELAND.

Eddoes, ɛd'ōz, a tropical vegetable. See COCCO.

Eddy, Clarence, American organist: b. Greenfield, Mass., 23 June 1851. He studied with Haupt in Berlin 1871, and between 1877 and 1879 gave a series of organ recitals numbering 100, without repetitions, in Hershey Music Hall, Chicago, in which city he resided for many years. He made successful tours through Europe, and in 1895 removed to Paris. In 1899 he was appointed director of music at the Paris Exposition of 1900.

Eddy, Henry Turner, American educator: b. Stoughton, Mass., 9 June 1844. He was graduated at Yale College in 1867. He was assistant professor of mathematics and civil engineering in Cornell University 1869-73; professor of mathematics, astronomy and civil engineering in the University of Cincinnati 1874-90; president of the Rose Polytechnic Institute, Terre Haute, Ind., 1891-4; in the last-named year accepting the chair of engineering and mechanics in the University of Minnesota. His publica-

tions include: 'Analytical Geometry' (1874); 'Researches in Graphic Statics' (1878); 'Thermodynamics' (1879); 'New Constructions in Graphic Statics' (1880, in German); 'Maximum Stresses Under Concentrated Loads,' etc.

Eddy, Mary Baker Glover: b. Bow, N. H. The world's highest meed of praise is eventually bestowed upon those who have made the largest contribution to its spiritual good, and it is in the light of this fact that the honored place of Mrs. Eddy's name, in the annals of the race, is unqualifiedly assured. The prominence in public thought which she has already attained, as the Discoverer and Founder of Christian Science, and the tender love which glows for her upon the altars of unnumbered hearts, find their explanation in the ministry of good which she has brought to her fellowmen.

Born in the town of Bow, N. H., her youth was spent in sympathetic touch with that picturesque beauty of nature for which the region is famed. Mrs. Eddy's great-grandfather, Captain Joseph Baker, was a man of honored reputation and bore a commission conferred by the Provincial Assembly. Her father and grandfathers were sturdy husbandmen who served God and their country as best they knew, and fostered in their children the elements of a noble character. The intellectual tastes and assertive strength of her father, and the piety and loving winsomeness of her mother, were united in her nature, and one who knew her intimately in her girlhood has spoken of her as being distinguished even then for "her superior ability and scholarship, her depth and independence of thought, and her spiritual-mindedness," all of which were but prophecies of her character, her ministry, and eminence as a religious leader.

She was a student of Sanbornton Academy, and later pursued her studies under Prof. Dyer H. Sanborn, and her brother Albert, who was a gifted and scholarly man. At 16 her fertile pen, as well as her ceaseless inquiry and investigation, began to disclose that impelling and insatiable instinct of the poet and truth-seeker which in later years was to achieve such beneficent and far-reaching results. In all the years which were revealing to her the vanity and unsatisfactoriness of earthly hopes, she was seeking, in the quiet cloisters of spiritual aspiration, for that revelation of truth which would bring her heart assurance and peace. Unaccompanied save by patient and unflinching faith, she followed that ascending path which leads from the plane of common experience to the higher levels of spiritual apprehension, and in an hour of hopeless physical suffering she reached such a realization of the present healing potency of the Master's word that she was immediately made whole. Mrs. Eddy's life since this epoch-making experience and discovery in 1866 has been devoted to that interpretation of the teaching of Jesus, and the practical application of its saving truths to human need, which she has denominated Christian Science.

Her great work, 'Science and Health with Key to the Scriptures,' was published in 1875, and has now reached its 280th edition. This is the text-book of Christian Science, embodying not only its teaching, but the practical rules by which every sincere inquirer may avail himself of its benefits. She has written and published many other works relating to Christian

EDDY — EDDYSTONE ROCKS

Science, including 'Miscellaneous Writings,' 471 pp.; 'Retrospection and Introspection,' 120 pp.; 'Pulpit and Press,' 132 pp.; 'Unity of Good,' 80 pp.; 'Rudimental Divine Science,' 35 pp.; 'No and Yes,' 55 pp., and many other pamphlets, poems, annual messages to the Mother Church, etc. She has organized and conducted the movement, established its periodicals and educational system, and as leader, lecturer, teacher, editor and counselor has accomplished a work whose magnitude, substantiality, and success are a marvel to men.

The First Church of Christ, Scientist, the "Mother Church," in Boston, Mass., was chartered in 1879, and the church edifice was completed in 1895. Its present membership is about 28,000. Seven hundred and sixty-five Christian Science churches and societies, many of them provided with splendid church edifices, are now found in America, England, and other countries.

Mrs. Eddy has ever been known as a very generous and public-spirited woman. Her public and private benevolences have been large, amounting to hundreds of thousands of dollars. She recently gave \$100,000 toward the erection of an adequate Christian Science church in her native town.

Beloved and honored by all who know her, Mrs. Eddy lives in modest retirement at her country home in Concord, N. H., where, with unabated vigor and untiring devotion, she continues to direct that beneficent movement with which her name will ever be associated.

JOHN BUCKLEY WILLIS,

2nd Ed. C. S. Publications, Boston, Mass.

Eddy, Richard, American Universalist clergyman: b. Providence, R. I., 21 June 1828. During the Civil War he served as chaplain of the 60th New York Volunteers 1861-3. In 1877 he was made the president of the Universalist Historical Society, which office he still holds. He was editor of 'The Universalist Quarterly Review' (1884-91) and of the 'Universalist Register' since 1887, and is a prominent prohibitionist. He has published: 'History of Sixtieth New York State Volunteers' (1864); 'History of Universalism in America 1836-86' (1884-6); 'Alcohol in History' (1887); 'Alcohol in Society' (1888); 'Universalism in Gloucester, Mass.' (1892); 'History of Universalism A.D. 120-1890' in American Church History series (1894); and 'Life of Thomas J. Sawyer, D.D., and Caroline M. Sawyer' (1900).

Eddy, Thomas, American philanthropist: b. Philadelphia, Pa., 5 Sept. 1758; d. New York 16 Sept. 1827. He entered the insurance business in 1790, in which he made a large fortune. With Philip Schuyler and Ambrose Spencer he presented a bill for establishing a penitentiary system in 1796, which was passed. He had charge of erecting the first building and for four years was its director. In 1793 he was appointed by the Society of Friends to visit the Indians in New York State; was one of the governors of the New York Hospital; and in 1815 one of the founders of the Bloomingdale Insane Asylum. He was also one of the originators of the New York Savings Bank and the New York Bible Society, and a conspicuous promoter of the Erie Canal. He received the title of the "American Howard" for these labors, and in 1801 published 'State Prison of New York.'

Eddy, Thomas Mears, American clergyman: b. Newton, Hamilton County, Ohio, 7 Sept. 1823; d. New York 7 Oct. 1874. He studied in the classical seminary of Greensboro, Ind., and joined the Indiana Methodist conference in 1842. He was editor of the 'North-western Christian Advocate' from 1856 to 1868; served as pastor in Baltimore for three years; was appointed to the Metropolitan church in Washington, D. C., in 1872, and in the same year he was elected corresponding secretary of the Methodist Missionary Society. He was eminent as a journalist and was an author of no mean ability. Among his works was a 'History of Illinois during the Civil War' (2 vols. 1865).

Eddy Currents are short local currents set up in the iron masses of dynamo electric machinery; according to the law of Lenz they absorb a part of the energy expended in running the machine. The usual way of preventing them is to construct the parts affected, namely, the pole pieces and the armature cores, of laminæ built up so that the mass of the iron is divided by planes in a direction perpendicular to the direction of the electromotive forces tending to start the eddies.

Eddystone Lighthouse. The frequent shipwrecks on Eddystone rocks off the coast of Cornwall, England, led to the erection of a lighthouse on them by Henry Winstanley in 1696-1700. It was a wooden polygon, 100 feet high, with a stone base; but the great storm of 20 Nov. 1703, completely washed it away, with the architect. Another lighthouse was built in 1706-9, also of wood, with a stone base, and 92 feet high, by Mr. Rudyerd, a silk-mercator. This erection was burned in 1755. The next, noted for its strength and the engineering skill displayed in it, was constructed by Smeaton in 1757-9, on the model, it is said, of the trunk of the oak tree. It was built of blocks, generally one to two tons weight, of Portland oolite, encased in granite. The granite was dovetailed into the solid rock, and each block into its neighbors. The tower, 85 feet high, had a diameter of 26¾ feet at the base and 15 feet at the top. The light, 72 feet above the water, was visible at a distance of 13 miles. As the rock on which this tower was built became undermined and greatly weakened by the action of the waves, the foundation of another was laid on a different part of the reef in 1879. The new lighthouse, completed in 1882 by Sir James N. Douglass, is, like its predecessor, ingeniously dovetailed throughout. Its dioptric apparatus gives, at an elevation of 133 feet, a light equal to 159,600 candles, and visible in clear weather to a distance of 17½ miles. See EDDYSTONE ROCKS; LIGHT-HOUSE.

Eddystone Rocks, well known to seamen who navigate the English Channel, consisting of three principal ridges, and extending 600 or 700 yards in length. They lie nearly in the fair way from the Start to the Lizard, and are therefore an object of the utmost importance to mariners. On the summit of the largest rock a lighthouse has been erected, to serve as a beacon or signal to avoid the danger, as they are covered at the flood tide, but become dry at the ebb. It is situated 15 miles south-southwest of Plymouth, 45 east of Lizard Point; lon. 4° 16' W.; lat. 50° 10' 54" N. The swell at these

rocks is tremendous. After a storm, when the sea is to all appearance quite smooth, and its surface unruffled by the slightest breeze, the ground-swell or under-current, meeting the slope of the rocks, often causes the sea to rise above the lighthouse in a magnificent manner, overtopping it as with a canopy of foam. See EDDYSTONE LIGHTHOUSE.

Edelfelt, ä'dël-fêlt, Al'bert Gus'tav A'ristid, Finnish painter: b. Helsingfors, Finland, 21 July 1854. He began his artistic studies at Antwerp and afterward became a pupil of Gérôme, in Paris, where he developed a high skill in draughtsmanship, in the department of genre and portrait painting. He gained a second medal in the Paris Salon of 1882, and a medal of honor in the Paris Exposition of 1889. Two of his pictures have been purchased by the French nation for the Luxembourg.

Edelinck, ä'dêl-înk, Gerard, Flemish engraver: b. Antwerp 20 Oct. 1649; d. Paris 2 April 1707. He was patronized by Louis XIV., and produced over 420 plates.

Edelweiss, êd'êl-wîs; Ger. ä'dêl-vîs ("Noble-white"; *Gnaphalium* or *Leontopodium alpinum*), a perennial plant of the order *Compositæ*, growing at great altitudes in the Alps, the Pyrenees, and also in parts of Austria and Siberia. Its flower is white and somewhat star-shaped, the heads surrounded with a characteristic woolly involucre, and its leaves also having the same woolly character. It is comparatively scarce; generally grows in inaccessible positions; is eagerly sought by Alpine tourists, and has become so rare in some of the Swiss cantons that it is protected by law. The supposed difficulty of gathering it is the groundwork of various legends and poems; as the emblem of purity, it is given by the Tyrolese youth to his affianced bride. It is not difficult to cultivate and is found in American and European gardens, but is apt to lose its distinctive woolly character under cultivation.

Edema. See ŒDEMA.

Eden, Emily, English novelist and traveler: b. Old Palace Yard, Westminster, 3 March 1797; d. Richmond, England, 5 Aug. 1869. Among her works are: 'Portraits of the People and Princes of India' (1844); 'The Semi-detached House' (1859); 'The Semi-attached Couple' (1860).

Eden, Sir Robert, last proprietary governor of Maryland: b. Winderstone Hall, Durham, England; d. Annapolis, Md., 2 Sept. 1784. As captain in the Coldstream Guards he served in the Seven Years' war. He was appointed governor of Maryland in 1768, where he remained until 1776, when that State committed itself to the principles of the Revolution, and virtually declared the proprietary governorship at an end. He left in an English warship, but returned a few months before his death. See Steiner, 'Life and Administration of Sir Robert Eden.'

Eden, William. See AUCKLAND, WILLIAM EDEN, LORD.

Eden, the garden of paradise. It would be difficult in the whole history of opinion, to find any subject which has so invited and at the same time so completely baffled conjecture, as the Garden of Eden. The three continents of the Old World have been subjected to the

most rigorous search; but no locality which in the slightest degree corresponded to the description of the first abode of the human race has been left unexamined. Philo Judeus (flourished about 20) first broached the allegorical theory of interpretation, teaching that paradise shadowed forth the governing faculty of the soul, and that the tree of life represented religion, the true means of immortality. Origen, adopting a somewhat similar view, regarded Eden as heaven, the trees as angels, and the rivers as wisdom; and Ambrosius considered the terrestrial paradise and the third heaven, mentioned by St. Paul (2 Cor. xii. 2-4), as identical. Luther taught that Eden was guarded by angels from discovery and consequent profanation until the Deluge, when all traces were destroyed. Swedenborg, who regarded the first 11 chapters of Genesis as constituting a divine allegory, taught that Eden represented the state of innocence in which man was originally created and from which he degenerated in consequence of the Fall. The account given in Genesis of the situation of Eden is not such as to enable us to identify it with any existing locality. It is said to have had a garden in the eastern part of it, and we are told that a river went out of Eden to water this garden, and from thence it was parted into four heads, which were called respectively Pison, Gihon, Hiddekel, and Euphrates (Phrat). The Pison is said to compass the whole land of Havilah; the Gihon that of Ethiopia (Cush); and the Hiddekel to go toward the east of Assyria. Of the rivers mentioned the Phrat of the original seems to have been correctly identified with the Euphrates, and the name Hiddekel appears elsewhere in Scripture (Dan. x. 4) to be applied to the Tigris; but it is impossible to say what rivers or places were meant by the names Pison, Gihon, Havilah, and Cush. See ADAM.

Eden, a river in England, rising in a hill in Westmoreland, near the northwest boundary of Yorkshire; flows northwest, passing Appleby and Carlisle, and empties into the Solway Firth. Total course, about 50 miles.

Eden of America, a name bestowed on the island of Aquidneck, off the coast of Rhode Island, on account of its great fertility.

Edenhall, the ancient seat of the Musgraves in Cumberland, four miles northeast of Penrith, England. Here is still preserved the famous "Luck of Edenhall," an old painted glass goblet, said to have been snatched from the fairies, on the safety of which the welfare of the house depends. It is supposed to have been a chalice, and its leathern case bears a sacred monogram. Uhland's well-known ballad, 'The Luck of Edenhall,' has carried its fame beyond the British islands.

Edentata, ê-dên-tâ'ta, one of the smaller orders of mammals, most of which are found in South America. It includes the South American sloths, ant-eaters, and armadillos, and two Old World groups, all of which are characterized by an absence of front teeth, and in a few instances, of completely toothless jaws, whence the generic name. Where teeth are present they are without enamel, and lack distinct roots, are all alike, and generally are not preceded by a set of milk teeth. These animals are ranked comparatively low in the scale of

mammals, not only on account of their deficiency in teeth, but also because their brains are relatively small, and lack the convolutions characteristic of the more highly developed orders. With two exceptions, the armadillos and pangolins, the Edentata are clothed with coarse hair. The armadillos are peculiar among mammals, in that their bodies are covered with an armor of bony plate; and in the pangolins the entire body is protected by a coat of overlapping, horny scales. The typical edentates are the sloths (*Tardigrada*), the ant-eaters (*Vermilinguia*), and the armadillos (*Loricata*), all of which are American; the two groups in the order, native to Africa and Asia, are the pangolins (*Squamata*), and the aard-varks (*Fodientia*), although Lydekker questions the correctness of placing the last two among the edentates, preferring to consider the present and extinct forms as an entirely American order. The sloths live on vegetable food exclusively, the other group chiefly on insects or animal matter softened by decay.

Fossil Edentates.—Of the large and numerous edentate fauna which lived in South America during the Tertiary and Quaternary periods, some (*Myloodon*, *Megalonix*, *Glyptodon*) spread to North America during the Pliocene and Pleistocene epochs; the armadillo is still found as far north as the Mexican border of the United States. Their earliest ancestors were, perhaps, North American, but their development was exclusively in the southern continent during most of the Tertiary Period. The earlier stages in their evolution were of small or moderate size; later on they became of huge size and very highly specialized. The most remarkable among them were the *Megatheriida* of the *Bruta* order, ground-sloths, distantly related to the modern true sloths, but terrestrial animals, very heavily proportioned, with massive hind quarters and tail, and immense digging claws; and the *Glyptodonts*, related to armadillos but much longer, with massive unjointed carapace like that of a tortoise, and with hoofs instead of claws. Besides these were numerous true armadillos, both large and small, some ancestral to the modern species, others of extinct races. No fossil ant-eaters have yet been discovered, and fossil tree-sloths are almost equally unknown; but the fossil beds of South America have been so imperfectly explored that this fact is not surprising.

Edenton, N. C., town, county-seat of Chowan County; on the Albemarle Sound, near the mouth of the Chowan River; on two branches of the Norfolk, Va., B. & S. R.R.; about 90 miles north of Beaufort and 115 miles northeast of Raleigh. Four steamship lines enter Edenton, thus making it a good shipping point for the trade of the northeast part of the State. The shallow waters of the Albemarle Sound are a hindrance to more extensive shipping. The name given to the town when founded in 1712 was Queen Anne's Creek, but this was changed to Edenton in honor of a governor of the colony, Charles Eden. In less than one year after the "Boston Tea Party" a number of the housewives of Edenton resolved not to assist in supporting England by paying a tax on tea; and they formed themselves into an organization, none of whose members should drink tea. In addition to being first among

those who held Revolutionary tea parties, they seem to have been pioneers in America in the formation of organizations for women. The chief industries are lumbering and fishing. Pop. 3,210.

Eder, á'dér, Joseph Maria, Austrian chemist: b. Krems on the Danube 16 March 1855. He taught photo-chemistry at the Technical School, Vienna, and 1882 was made professor of chemistry at the Industrial School in that city. He has made great contributions to the development of the art of photography, particularly with reference to the use of chloride or bromide of silver. He also invented a photometre for measuring the invisible ultra violet rays by the oxalate of mercury. Among his works are: 'Photographie aux sels de chrome'; 'Etudes sur l'action de la lumière colorée' (1879); 'Manuel de photographie' (1882).

Edes, Robert Thaxter, American physician: b. Eastport, Maine, 23 Sept. 1838. He was graduated at Harvard 1858, and at the Harvard Medical School 1861; served as surgeon in the United States navy 1861-5; was professor of materia medica 1870-84; and professor of clinical medicine 1884-6 at the Harvard Medical School. He was physician at the Boston City Hospital 1872-86, and at the Garfield Memorial Hospital, Washington, 1889-91, and resident physician at the Adams Asylum 1891-7. Among his works are: 'Nature and Time in the Cure of Diseases' (1868); 'Physiology and Pathology of the Sympathetic or Ganglionic Nervous System' (1869); 'Therapeutic Handbook of the United States Pharmacopœia' (1883); 'Therapeutics and Materia Medica' (1887); and many contributions to medical journals at home and abroad.

Edes'sa, the name of two ancient cities. (1) The ancient capital of Macedonia, and the burial place of its kings, now Vodhena. It is probably the same with the still more ancient Ægæ. (2) An important city in the north of Mesopotamia, which, subsequent to the establishment of Christianity, became celebrated for its theological schools. During the centuries which were affected by the Christianizing of Rome, Edessa became the centre of learning of Syria. (See SYRIA; SYRUS.) The modern city of Urfah or Orfa stands on the site once occupied by Edessa. (See URFAH.) In 1089, in the first crusade, Edessa came into the hands of Baldwin, but ultimately became part of the Turkish empire. It was one of the greatest four cities of Syria, the other three being Antioch, Damascus, and Nisibis.

Edfu, ɛd'foo, town of Upper Egypt; situated on the Nile, 54 miles southeast of Thebes. It contains the remains of two temples, the larger of which is the best preserved monument of its kind in Egypt. It was founded by Ptolemy III. Philopator more than two centuries before Christ, and added to by his successors down to Ptolemy XIII. Dionysus, a period of 170 years. The general plan of the temple resembles that of Dendera. Its length is 451 feet, the breadth of its façade is 250 feet. Its entrance is by a gateway 50 feet high, between two immense truncated pylons, 37 feet wide at the base, and 115 feet high, the whole surface covered with sculptures and inscriptions

in low relief. This splendid façade is visible from a great distance, and is one of the most commanding sights in the Nile valley. Passing through this entrance, a court is reached 161 feet long, and 140 feet wide, enclosed by a splendid colonnade of 32 columns of every variety of capital, and surrounded by walls between which and the pillars there is a stone roof, forming a covered portico. From this court opens a hypostyle hall of 18 columns, joined by an intercolumnial screen, through which access is obtained to an inner hall of 12 columns, leading to the sanctuary, where a great monolith of gray granite was evidently intended to encage the hawk, the sacred emblem of Hor-Hud, the local Horus, to whom the temple was dedicated.

The sanctuary and surrounding chambers, together with the outer and inner halls, are separated by an open corridor from the outer wall of the temple, and both sides of this passage are covered with elaborate reliefs and numerous inscriptions, which present a sort of encyclopædia of ancient Egyptian geography, ritual, and ecclesiastical topography, with calendars of feasts, lists of divinities in the various names and cities, and even a species of church directory, including the names of singers and other temple officials. The smaller temple, erected by Ptolemy Physcon and Lathyrus, consists of only two chambers. The manufactures of Edfu at present are blue cotton cloths, and earthen-ware similar to the ancient Egyptian pottery. Pop. 2,500.

Consult: Wiedemann, 'Religion of the Ancient Egyptians'; Mariette, 'Monuments of Upper Egypt.'

Edgar ("THE PEACEABLE"), one of the most distinguished of the Saxon kings of England, was the son of King Edmund. He succeeded to the throne in 958, and managed the civil and military affairs of his kingdom with great vigor and success. He maintained a body of troops to control the mutinous Northumbrians, and repel the incursions of the Scots, and fitted out a powerful navy to protect his subjects from the Danes. During the reign of Edgar wolves were nearly extirpated from the southern parts of the island, by exchanging a tribute from Wales for payment in the heads of these animals. He married Elfri, daughter of the Earl of Devonshire, in 965. It was during his reign that Dunstan was primate of England. (See DUNSTAN, SAINT.) He died in 975, and was succeeded by his son, Edward the Martyr.

Edgar Atheling, Anglo-Saxon prince: b. Hungary about 1057; d. toward the end of the 11th century. He was a grandson of Edmund Ironside, and his life may be epitomized as a series of abortive attempts. Selected by Edward the Confessor as his prospective heir, he was kept out of the throne by William the Conqueror (1066); having twice engaged in the northern revolts against the Normans, he was twice compelled to take refuge in Scotland, with Malcolm Canmore, who married Edgar's sister, Margaret; then, embracing the cause of Robert, Duke of Normandy, against William Rufus, he was driven away (1091) from the duchy to Scotland; then he embarked (1099) in a bootless crusading expedition to the East; and finally was taken prisoner at Tenchebrai (1106) fighting for Duke Robert against his brother Henry I. Almost the only successful achievement of his life

seems to have been that of reseating his nephew Edgar on the throne of Scotland (1097), which had been usurped by Donald Bane. His last days were spent in obscurity; the date of his death is not precisely known.

Edgar, James David, Canadian statesman: b. Hatley, P. Q., 10 Aug. 1841. He was admitted to the bar 1864, first practising in Toronto; was made a Q.C. by the Ontario government in 1890. In 1872 he was elected to Parliament for Monck, being chief Liberal "Whip"; served on a political mission to British Columbia, and was re-elected from West Ontario 1884. He was elected speaker of the commons in the new parliament 1896, and was instrumental in passing the Canadian Copyright Act 1889. Later he devoted much attention to the question of international arbitration. He was elected a Fellow of the Royal Society of Canada 1897. He has published: 'The White Stone Canoe' (1887); 'This Canada of Ours and Other Poems' (1893); an 'Annotated Edition of the Insolvent Law' (1864); and several other law books.

Edgar, John George, English biographer and historian: b. 1834; d. 1864. In business at Liverpool, he left it for literature: edited 'Every Boy's Magazine,' contributed to the London press, and wrote biographies and histories, mainly for the young; among them: 'The Boyhood of Great Men' (1853); 'Footprints of Famous Men' (1853); 'Crusades and Crusaders' (1859); 'Sea Kings and Naval Heroes' (1860); 'Cavaliers and Roundheads' (1861).

Edgartown, Mass., town, county-seat of Duke's County; situated on the eastern shore of the island of Martha's Vineyard. At present it is a summer resort, but it was once a whaling station of importance. The town was settled in 1642. Pop. (1900) 1,209.

Edgcumbe, ěj'cũm, **SIR EDWARD ROBERT PEARCE**, English traveler: b. 13 March 1851. He was educated at Cambridge, was mayor of Dorchester 1891, and sheriff of Cornwall 1896. He has published: 'Zephyrus, or Travels in Brazil and on the River Plata' (1887); 'Bastiat's Popular Fallacies' (4th ed. 1893); 'Popular Fallacies Regarding Bimetallism' (1896); 'The Parentage and Kinsfolk of Sir Joshua Reynolds' (1901).

Edgehill, ěj'hil, England, an eminence in Warwickshire, 12 miles south of Warwick. Here was fought the first battle of the civil war, Sunday, 23 Oct. 1624, between the Royalists under Charles I. and the forces of the Parliament under the Earl of Essex. It was an indecisive engagement.

Edgeworth, ěj'wẽrth, **MARIA**, English novelist: b. Hare Hatch, near Reading, Berkshire, 1 Jan. 1767; d. Edgeworthstown, Ireland, 21 May 1849. In 1782 her father, Richard Lovell Edgeworth, succeeded to the family estate of Edgeworthstown, in the county of Longford, Ireland, and thither he proceeded and took up his abode. In 1802 she established her position as an author by her 'Castle Rackrent,' a novel of Irish life, in which the manners and customs of a by-gone generation are most graphically and humorously described. A 'Treatise on Irish Bulls' appeared in 1803, and about the same time she began the series of tales on which her fame will rest. These comprise: 'Moral Tales';

EDGREN — EDICT OF NANTES

'Popular Tales'; and 'Tales of Fashionable Life', all written in the clearest and most vigorous style, without the least affectation of sentiment or fine writing. She also wrote: 'The Parents' Assistant,' a collection of tales for children, and the well-known series of 'Early Lessons'; 'Harry and Lucy'; 'Frank'; and 'Rosamond.' Belonging to the class of regular novels are 'Belinda'; 'Leonora'; 'Patronage'; 'Harrington'; and 'Ormond.' In estimating Miss Edgeworth's literary merits too much praise cannot be given to her terse and nervous style, alike simple and elegant, or to the lucidity and consecutiveness which characterize all her compositions. Her skill in plot is considerable, and the interest excited in the characters and issue of the story is never allowed to flag. See Thackeray Ritchie, 'Book of Sibyls' (1883); Zimmern, 'Life of Maria Edgeworth' (1883).

Edgren, Anne Charlotte Leffler, än shär-löt'tē lēf-lēr ēd'grēn, Swedish novelist and dramatist: b. Stockholm 1 Oct. 1849; d. Naples 24 Oct. 1892. A volume of short tales, 'By Chance,' and the dramas, 'The Actress'; 'The Curate'; etc., were a great success anonymously; and she then put her own name to three successive volumes of short stories called 'From Life,' followed by 'A Summer Story'; 'Woman and Erotism'; and many others. 'Ideal Women'; 'The Struggle for Happiness'; and 'A Rescuing Angel' (the most successful of her plays), are notable among her later dramas.

Edgren, August Hjalmar, Swedish-American educator: b. Wermland, Sweden, 18 Oct. 1840. He came to the United States in 1860, joined the 99th New York Regiment as second lieutenant January 1862; and in August 1863 entered the engineer corps. He was connected with Yale University 1874-80, and since 1893 has been professor of Sanskrit and linguistic science at the University of Nebraska. His numerous publications include a Swedish work on the 'Literature of America' (1878); 'Swedish Literature in America' (1883); and 'American Antiquities' (1885); besides many valuable papers for students, pertaining to Sanskrit, romance, and Germanic philology.

Edhem Pasha, pash-ā' or pāsh'a, Turkish soldier and statesman: b. Scio of Greek parentage 1813. He studied in Paris, and on returning to Turkey was attached to the staff of the army with the rank of captain, rapidly attained that of colonel, and was appointed a member of the Council of Mines at the time of its formation. Having been appointed aide-de-camp to the Sultan in 1849, he soon was placed at the head of His Majesty's household troops. In 1856 he resigned the functions which he had fulfilled at the palace, and was appointed a member of the council of the Tanzimat, and afterward minister of foreign affairs, with the rank of *muchir*. Subsequently he played an important part in the affairs of his country, where he was nominated president of the Council of State. He was also for some time ambassador at Berlin. At the Conference of Constantinople (1876-7) he acted as the second Turkish plenipotentiary, and was appointed to succeed Midhat Pasha as grand vizier, 5 Feb. 1877.

Edhem Pasha, Turkish soldier: b. 1851. In 1877 he held the rank of colonel in the Turkish army and rose rapidly during the war with Russia. He was appointed governor-general of the Vilayet of Kossowo, and was later made adjutant-general and field marshal. In the war with Greece (1896-7) he had the chief command of the Turkish army.

Edible Birds' Nests. See BIRDS' NESTS, EDIBLE.

Edict, a public proclamation. In ancient Rome, the higher officers of state, who were elected annually, publicly declared, at their entrance upon office, the principles by which they should conduct their administration. This was done particularly by the *ediles*, who superintended buildings and markets, and by the *prætors*, as supreme judges. These annual proclamations, by which the deficiencies of the general statutes were supplied, and the laws were adapted to the peculiar wants of the period, gradually acquired a certain permanency, as each officer retained, unaltered, most of the regulations of his predecessor (*edictum tralatitium*); and they became, in fact, the source of that branch of Roman law which, being founded on the official authority of the authors, was called *jus honorarium*, and was opposed to the strictly formal law, *jus civile*. Though according to Roman jurists these usually indirect forms of legislation had their object in rendering the civil law more expedient to the public welfare, and always received the seal of the people's approval. Edicts were sometimes made for some special occasion, in which case they were called *edicta repetina*. It was against the abuse of this kind of edicts that the Lex Cornelia in 67 B.C. was directed. Those which were applicable in all cases during the tenure of office of the magistrate who issued them were called *edicta perpetua*. The name of *edictum perpetuum* was also given to a collection and arrangement of the clauses which the *prætors* were accustomed to put into their annual edicts, made under the Emperor Hadrian by Salvius Julianus about 131 A.D. What the exact nature of the work thus done by Julianus was is not known, but the edict prepared by him, and sanctioned by imperial authority, had unquestionably a special force, and it is likely that it restricted in future the right enjoyed by magistrates of issuing edicts, to such cases as were not provided for in the edict of Julianus. Only a few fragments of the ancient Roman edicts have been preserved. See CIVIL LAW.

Edict of Nantes, a decree of Henry IV. king of France, published 13 April 1598, by which he conceded to the Huguenots, or Protestants of that kingdom, toleration for their religious beliefs, teachings, and practises; freedom of public worship and liberty to erect churches, except at Paris and the royal residences, and to maintain the four Protestant universities of Saumur, Montauban, Montpellier, and Sedan; admission as members to the parliament of Paris and the right to special chambers in the parliaments of Grenoble and Bordeaux; further, the right to hold provincial and national synods. In 1620 the Huguenots in their political congress at La Rochelle confiscated all the property of the Roman Catholic churches and constituted throughout France a military and civil organization for Huguenot ends.

EDINA — EDINBURGH

Before the formal revocation of the Edict of Nantes the liberties of the Protestants were largely restricted by partial acts of revocation, which precluded them from office in the government, from membership in trade corporations, etc., and from marriage with Roman Catholics. The edict was formally revoked by a decree of Louis XIV. 18 Oct. 1685. It ordered the churches of the Huguenots to be destroyed, forbade the holding of religious meetings and of synods by Protestants on penalty of confiscation of goods; banished all Protestant ministers; ordered the children of Protestants to be baptized and brought up as Roman Catholics. The Huguenots to the number of some 500,000 made for the frontiers or the coast and sought an asylum in Great Britain, Holland, Switzerland, Prussia, and the American colonies of England. In all those countries they proved themselves as artisans and artificers, a valuable accession to the nations that received them, and added materially to the strength of the enemies and the rivals of France, both in peace and in war.

Edi'na, Mo., city, county-seat of Knox County; on the Omaha, K. C. & E. R.R., about 110 miles north of Jefferson City. Its manufactures are principally lumber, flour, butter, wagons, and carriages; and the trade is chiefly in agricultural products, stock, and the imports needed for local consumption. Pop. 1,700.

Edina, or **Edin**, a synonym for Edinburgh, introduced by George Buchanan, and frequently met in Scottish poetry. See **DUNE EDIN**.

Edinburgh, ɛd-in-bŭr'ō, **Duke of** (**PRINCE ALFRED ERNEST ALBERT**), Duke and sovereign of Saxe-Coburg-Gotha, English prince: b. Windsor Castle 6 Aug. 1844; d. Coburg, Germany, 30 July 1900. He was the second son of Queen Victoria and at the age of 14 joined the navy as naval cadet, and served on various foreign stations. In 1862 he declined the offer of the throne of Greece. On his majority he was awarded an annuity of £15,000 by Parliament, and was created Duke of Edinburgh, Earl of Kent, and Earl of Ulster. In 1873 he received an additional annuity of £10,000, and next year married the Grand-duchess Marie, only daughter of the emperor of Russia. In 1882 he was made a vice-admiral, and subsequently held important commands, being also created admiral of the fleet. In 1893 he succeeded his uncle as ruler of Saxe-Coburg-Gotha, and resigned his annuity of £15,000. He was succeeded by his nephew, the Duke of Albany.

Edinburgh, **Edinburghshire**, or **Midlothian**, a maritime county of Scotland; area, 231,724 acres. The surface is hilly and the productions are about as in Scotland generally. The chief town is Edinburgh. (See **EDINBURGH**.) Pop. (1900) 488,647.

Edinburgh, Scotland, the chief city of Scotland, and one of the finest as well as most ancient cities in the British empire; lies within two miles of the south shore of the Firth of Forth. It is picturesquely situated, being built on three eminences and surrounded on all sides by lofty hills except on the north, where the ground slopes gently toward the Firth of Forth. The central ridge, which constituted the site of the ancient city, is terminated by the castle on the west, situated on a high rock, and by Holy-

rood House on the east, nor far from which rise the lofty elevations of Salisbury Crags, Arthur's Seat (822 feet high), and the Calton Hill overlooking the city. The valley to the north, once the North Loch, but now drained and traversed by the North British Railway, leads to the New Town on the rising ground beyond, a splendid assemblage of streets, squares, and gardens. The houses here, all built of a beautiful white freestone found in the neighborhood, are comparatively modern and remarkably handsome.

The principal streets of the New Town are Prince's Street, George Street, and Queen Street. Prince's Street is adorned with Sir Walter Scott's monument and other notable buildings. The principal street of the Old Town is that which occupies the crest of the ridge on which the latter is built, and which bears at different points the names of Canongate, High Street, Lawnmarket, and Castle Hill. This ancient and very remarkable street is upward of a mile in length, rising gradually with a regular incline from a small plain at the eastern end of the town, on which stands the palace of Holyrood, and terminating in the huge rock on which the castle is built, 383 feet above sea-level. The houses are lofty and of antique appearance. Among the notable buildings are the ancient Parliament House, now the seat of the supreme courts of Scotland; St. Giles' Church or cathedral, an imposing edifice in the later Gothic style, recently carefully restored; the Tron Church; Victoria Hall (where the General Assembly of the Established Church meets); the Bank of Scotland; besides some of the old family houses of the Scottish nobility and other buildings of antiquarian interest. At right angles to this main street and in regular rows are numerous narrow lanes called closes, many of them extremely steep, and very few at their entrances more than six feet wide; those which are broader, and admit of the passage of carriages, are called wynds. In these and the adjacent streets the houses are frequently more than 120 feet high, and divided into from 6 to 10 stories, or flats, the communication between which is maintained by broad stone stairs, winding from the lowest part of the building to the top. In the Old Town the most remarkable public building is the castle. This fortress contains accommodations for 2,000 soldiers, and the armory space for 30,000 stand of arms. In an apartment here is kept the ancient regalia of Scotland.

The palace of Holyrood, or Holyrood House, as it is more generally called, stands, as already mentioned, at the lower or eastern extremity of the street leading to the castle. No part of the present palace is older than the time of James V. (1528), while the greater portion of it dates only from the time of Charles II. In the north-western angle of the building are the apartments which were occupied by Queen Mary, nearly in the same state in which they were left by that unfortunate princess. Adjoining the palace are the ruins of the chapel belonging to the Abbey of Holyrood, founded in 1128 by David I. The Advocates' Library, the largest library in Scotland, contains upward of 250,000 printed volumes and 2,000 MSS.

On the southern side of the Old Town, and separated from it also by a hollow crossed by two bridges (the South Bridge and George IV.

Bridge), stands the remaining portion of the city, which, with the exception of a few unimportant streets, is mostly modern. Besides the buildings already noticed Edinburgh possesses a large number of important edifices and institutions, chief among which are the Royal Institution (containing accommodation for various bodies), the National Gallery of Scotland, the Museum of Science and Art, the new Episcopal Cathedral of St. Mary's, etc. Among the more prominent educational institutions are the university, the high school, the academy, the New or Free Church Theological College, the United Presbyterian Theological Hall, the Edinburgh School of Medicine, the Veterinary College, the Fettes College, the Heriot-Watt College of Science and Literature. The manufactures of Edinburgh are neither extensive nor important. Printing, book-binding, coach-building, type-founding, machine-making, furniture-making, ale-brewing, and distilling are the principal industries. Edinburgh is the headquarters of the book trade in Scotland, and the seat of the chief government departments.

The origin of Edinburgh is uncertain. Its name is thought to be derived from Eadwinsburgh, the Burgh of Edwin, a powerful Northumbrian king who absorbed the Lothians in his rule. The town was made a royal burgh in the time of David I.; but it was not till the 15th century that it became the recognized capital of Scotland. Pop. (1901) 316,479.

Edinburgh Review, The, one of the most celebrated of English quarterlies. It was established in October 1802, at a time when the periodical literature of Great Britain consisted of works conducted with inferior talent and occupying narrow grounds. Its success was immediate. All the great subjects of literature, science, philosophy, and politics were discussed in it with boldness, spirit, varied learning, acute reasoning, elegant criticism, a piquant satire, and original views. It was started by a number of young men in Edinburgh who were accustomed to meet occasionally to discuss questions connected with literature, politics, philosophy, and poetry. The principal of these were Henry Brougham (q.v.), Francis Jeffrey (q.v.), Sydney Smith (q.v.), and Francis Horner. It was edited for a few numbers by Sydney Smith; afterward Jeffrey was the editor from 1803 to 1829, and was one of the most fruitful contributors throughout the long time during which he conducted it. Under his editorship the periodical reached the highest summit of its prosperity, when it had from 12,000 to 13,000 subscribers. Jeffrey was succeeded by Macvey Napier. Among the principal writers (besides those above mentioned) are to be found the names of Playfair, Leslie, Sir Walter Scott, Sir W. Hamilton, Mackintosh, Dugald Stewart, Dr. Thomas Brown, Carlyle, Macaulay, James Mill, Hallam, etc. At present the quarterly is published in London, and upon its centenary (1902) issued a commemorative number.

Edinburgh, Treaty of, an engagement negotiated 6 July 1560, between Queen Elizabeth and the Scots for the evacuation of Scotland by the French. By this treaty Francis II. and Mary fully recognized the right of Elizabeth to the English crown, and agreed that Mary, in time to come, should neither assume the title nor bear the arms of England.

Edinburgh University, the latest of the Scottish universities, was founded in 1582 by a charter granted by James VI. The government, as in the other Scottish universities, is vested in the Senatus Academicus, the university court, and the general council. The chancellor of the university is elected for life by the general council. He is the head of the university and the president of the general council. The rector is elected for a term of three years by the matriculated students. He presides over the university court. The principal is the resident head of the college and president of the Senatus Academicus. The university court consists of the rector, principal, the lord-provost of Edinburgh, and assessors appointed by the chancellor, town council of Edinburgh, the rector, the general council, and the senatus respectively. The general council consists of the chancellor, the members of the university court, the professors, and all graduates of the university. There are four faculties, namely, arts, divinity, law, and medicine. Women may now graduate in arts, science, and medicine. The medical department has an international reputation and attracts students from all parts of the world. Some of the professors are appointed by the crown, others are elected by the university court and by special electors, and a considerable number by the curators, who also elect the principal.

In 1902 the teaching staff numbered 105, and the students about 3,000. The degree of M.A. is conferred on all who have completed their course and passed the ordinary examinations in the classical department (Latin and Greek), the department of mathematics and natural philosophy, and that of logic and metaphysics, moral philosophy, and rhetoric and English literature. Three medical degrees are conferred: Bachelor of Medicine (M.B.), Master in Surgery (C.M.), and Doctor of Medicine (M.D.). The degrees in law are Bachelor of Laws (LL.B.), Bachelor of the Law (B.L.), and Doctor of Laws (LL.D.). The last is purely honorary. The degrees of Bachelor of Divinity (B.D.), and Doctor of Divinity (D.D.), the latter honorary, are bestowed in the faculty of divinity. Degrees in science are also conferred. The degree of D.Sc. is conferred in the physical, in the natural, and in the mathematical sciences, in engineering, in public health or sanitary science, in mental science, and in philology. That of B.Sc. is conferred only in mathematical, physical, and natural science, in engineering, and in public health. The present university buildings were begun in 1789. The library of the university contains about 170,000 printed volumes, besides 2,000 manuscripts. There is also a separate theological library containing about 10,000 volumes. There are various bursaries, scholarships, and fellowships, amounting annually to about \$50,000.

Edis, Robert William, English architect: b. Huntingdon, England, 13 June 1839. He was president of the Architectural Association for two years, and among his constructions may be mentioned the club houses of the Constitutional, Junior Constitutional, and Badminton clubs, London; and the Conservative Club, Glasgow; The Great Central Hotel, London, and the Inner Temple Library. He has written and lectured much upon domestic art and house sanitation, and is a strong advocate of the extended use of

THOMAS ALVA EDISON,
AMERICAN ELECTRICIAN AND INVENTOR.

EDINBURGH.

1. The Castle and Museum.
2. The Old Town, from Princess Street.

EDISON—EDISON PORTLAND CEMENT WORKS

terra-cotta in building. He has published: 'Decoration and Furniture of London Houses'; 'Hand-book on Healthy Furniture'; etc.

Edison, Thomas Alva, American electrician and inventor: b. Milan, Ohio, 11 Feb. 1847. When he was seven years of age his family moved to Port Huron, Mich. Being denied ordinary school privilege, young Edison sought to earn his livelihood, and at the age of 12 became a newsboy on the Detroit and Port Huron branch of the Grand Trunk Railway. His leisure hours were spent in reading and boyish experiment with printing presses and telegraph instruments. He bought a small hand press, and in 1862 published a small weekly newspaper known as the 'Grand Trunk Herald.' His office was in an abandoned freight car where he continued his mechanical experiments. Later he learned to become a telegraph operator at Mount Clemens. Although a brilliant and rapid operator his erratic conduct, being given to pranks and fun-making, lost him several situations. While in Indianapolis in 1864, he invented an automatic telegraph repeater, the first of a long series of improvements and inventions. He soon after went to Boston, where he invented a commercial stock indicator, which he sold to New York capitalists for \$40,000. This gave him the long-cherished opportunity of establishing an extensive laboratory, which he did at Newark, N. J., for the special manufacture of electrical, printing, automatic and other apparatus. In 1876 his health failed and he gave up manufacturing, confining his labor to investigation and invention. He established his laboratory at Menlo Park, N. J., and later at West Orange, N. J., gave employment to hundreds of workmen and became known as one of the greatest inventors of the 19th century. More than 300 patents have been issued on his inventions, and he has besides produced hundreds of minor contrivances and improvements not covered by patents. Among his more important inventions may be named the phonograph, a telephone for long distance transmission, a system of duplex telegraphy (which he subsequently developed into quadruplex and sextuplex transmission), the carbon telephone transmitter, the microtasmeter, the ærophone, megaphone, the incandescent electric lamp, the kinetoscope, and a storage battery for street railway cars and automobiles. There is not an electrical instrument, or an electrical process now in use, but bears the mark of some great change wrought by the most ingenious of Americans. In 1878 he was made chevalier of the Legion of Honor by the French government, a commander of the Legion in 1889, and was the recipient of the insignia of a grand officer of the Crown of Italy bestowed the same year by King Humbert. In 1892 he received the Albert medal of the Society of Arts of Great Britain.

Edison is a man of remarkable personality. To those who believe his work is the product of an inspiration given by nature to but few, the story of the manner in which he achieves success will seem shockingly unromantic. In the genius who works by inspiration Edison has no great faith. "Genius is 2 per cent inspiration and 98 per cent perspiration," is the incisive, epigrammatic answer he once gave to a man who thought that a genius worked only when the spirit moved him. Not being given to scientific

rhapsodies, Edison does not concern himself with what may be of service a century hence; he confines himself rigorously to the needs of the present. Knowing full well that he is probably not the first who has set for himself the task in the performance of which he is engaged, he reads all that is pertinent to his subject in the vast library which forms an important adjunct of his laboratory. Not content with the information gathered from his own shelves his literary agent is ordered to send him more. After a thorough review of his subject, Edison begins laboratory work—an expert keenly alive to the failures of his predecessors, careful to avoid useless repetitions of old experiments. It is now that the 2 per cent inspiration gained by exhaustive reading, and the 98 per cent perspiration which he is ready to expend, are applied. Experiments are made; not a few, but hundreds and even thousands. Model after model is built. Failure upon failure is met with, until further efforts seem hopeless. Undismayed, Edison performs more experiments, builds more models. Failure spurs him on. At last an experiment is performed or a model made which gives faint encouragement. So far from being elated, he regards the promising result with great suspicion. The failures have been too many; the apparent success after all may be due to an accidental combination of circumstances that may never occur again. Only after the partial triumph has been confirmed by many trials does complete assurance come. Edison knows exactly what he wishes to accomplish, and how his end is to be attained. Absolute certainty of purpose and of method saves him from frittering away his time in useless experimentation. Chance has given perhaps an occasional idea, but it has not lightened his work. Tireless perseverance and long hours of work are the secrets of Edison's success. In 1897 Edison devoted his exclusive attention to the invention of a new storage battery, on which problem he had been engaged for some five years. For over a year he worked harder than a day laborer. He was at his laboratory at 7.30 in the morning. His luncheon was sent to him. In the evening he left for dinner, but returned at 8. At 11.30 at night his carriage called for him; but often the coachman had to wait for three or four hours until the inventor came out of his laboratory. Yet when vacation time comes, and with it a chance to leave his laboratory, Edison plays just as he works, with his whole heart and soul. He will hear nothing of business. Science is thrown to the winds.

Edison Portland Cement Works, a manufacturing establishment located at Stewartsville, N. J., and interesting for its employment of new methods, devised by the well-known inventor, T. A. Edison (q.v.), in the making of Portland cement. The rock, having been drawn on flat-cars to the crusher-house, is raised by electric hoists and dumped into the crushing-rolls. These rolls are arranged in four sets, one above the other, the material passing downward by gravity. The first set of rolls is 5 feet in length and diameter, the moving portions weighing approximately 25 tons each. They can receive and crush rocks of 5-ton weight, and are driven at a speed of 200 revolutions per minute. Beneath these rolls is a 10-ton hopper, from which the material is fed to three sets of

EDISON PORTLAND CEMENT WORKS

36-inch rolls. The rock in passing through the four sets is reduced to one half inch in size. The crusher house has a capacity of 3,000 tons per day of 24 hours, allowing for 16 hours of actual running and a maximum of 4 hours for stoppages. From the lowest set of rolls the crushed rock drops through a chute to a 24-inch belt conveyer, which transfers it to the top of the drier-house. Having arrived at the top of the drier-house, the material falls by gravity over screens composed of one half inch mesh screened plates. The rejected spalls are re-crushed and returned to the drier-house. The re-crushed material falls to the drier. The drier consists of a cast-iron box, 40 feet high and 8x8, filled with baffle-plates. Like the crusher, it has a capacity of 3,000 tons daily. The fall of the rock from the last screen to the bottom of the drier requires 26 seconds; the moisture in the crushed rock is reduced from 3 to 4 per cent to within 1 per cent. From the bottom of the drier stock a 24-inch belt conveyer transfers the dried rock to a transfer-tower, where it is received by another 24-inch belt conveyer, which passes along the entire length of the stock-house cupola, and deposits the rock in any bin desired by a self-propelling tripper. There are three bins for cement rock, three for lime rock, and one for mixing purposes. At the transfer tower an automatic sampler is installed, and this withdraws samples of the material as it is dumped from one conveyer to the other. By analysis of the material removed by the sampler, the general constituents of the material in any given bin may be ascertained. Great precautions are taken to dry the material in stock-house, should it become wet after leaving the drier. A 15-foot fan, passing 60,000 cubic feet of air per minute, creates a suction of warm air through the building from the furnaces at the other end, and thus removes excess moisture in the stored stock.

For the next step in the process of manufacture, the crushed rock emerges on a conveyer in a tunnel underneath the bins. By another conveyer it is raised to the first dump at the upper part of the weighing-house. Here are two bins, of 60 tons capacity each, one for the cement rock and one for the limestone. Beneath each of these bins is located a 10-ton weighing bin, the proper proportion of the raw

veyer which traverses the length of the building and passes two stationary trippers. Each tripper supplies 8 bins, whence the material is supplied to the discharge pipes of an equal number of fan-blowers. By a system of baffle-plates the material falls through the current of air maintained by the blower. The fine material is carried by the air-current to settling-chambers, whence it passes to bins. The coarse material is taken by conveyers to the chalk-grinding

The Automatic Sampler.

house for a further reduction. The set of fine grinding-rolls in the chalk-grinding house have a record of 280 barrels per hour. Of this ground material, 85 per cent passes through a sieve of 200 meshes per linear inch. From the stock-house, which has a capacity of 1,000 tons of chalk, the finely-ground material is conveyed to the burning plant. The kilns are of cast iron, 150 feet long and from 8 to 9 feet in exterior diameter. Each rotary kiln is supported on 30 wheels at 15 points of its length, and is moved at a speed varying from one revolution in 35 seconds to one in 40. The output of each kiln is about 750 barrels per day of 24 hours. The clinker formed by the vitrification of the chalk drops out at the lower end of the kiln into a revolving cylindrical cooler. Ordinarily the clinker from the cooler is spouted directly from the bucket conveyer. A second spout carries the clinker away to the bad clinker elevator. Thus defec-

A longitudinal section of one of the 150-foot kilns.

materials being secured in these latter bins. At the small rock stock-house begins a long tunnel, containing a 36-inch belt conveyer, which passes another raw-material or chalk-grinding house, where it receives the material furnished by the rolls, and whence it rises to the top of the blower-house. It is there received by a con-

veyer which traverses the length of the building and passes two stationary trippers. Each tripper supplies 8 bins, whence the material is supplied to the discharge pipes of an equal number of fan-blowers. By a system of baffle-plates the material falls through the current of air maintained by the blower. The fine material is carried by the air-current to settling-chambers, whence it passes to bins. The coarse material is taken by conveyers to the chalk-grinding

house for a further reduction. The set of fine grinding-rolls in the chalk-grinding house have a record of 280 barrels per hour. EDISTO — EDMUND

to the clinker grinders; then to a second blower-house, where fine and coarse are similarly separated, and thence to the cement stock-house. See CEMENT.

Edisto, *ēd'is-to*, a river in South Carolina, which has its rise in the southern part of the State, and which flows in a general direction southeast into the Atlantic Ocean. Its source is at the junction of two streams called North and South Forks of the Edisto River, and it flows into the ocean by two mouths, between which lies Edisto Island (q.v.). The river is 150 miles in length and navigable for 100 miles.

Edisto Island, an island on the coast of South Carolina, about 25 miles below Charleston, and is practically the delta of the Edisto River, which enters the sea by two arms. The soil is particularly adapted for the raising of cotton, the long-fibred product being known as Sea Island cotton. The vegetable industry on the island, raising and shipping vegetables to the Northern markets, has grown to large proportions. Pop. 482.

Ed'monton, Canada, town in the district of Alberta; on the north fork of the Saskatchewan River, and on a branch of the Canadian P. R.R., about 190 miles north of Calgary. Edmonton is the trading centre of an immense region which is rich agriculturally, and has valuable deposits of the precious metals, gold being found in places. The town was originally a settlement of the Hudson Bay Company, and one of the most important fur trading depots in the Northwest, and it has still considerable of this trade. Pop. (1901) 2,662.

Edmonton, England, town in the county of Middlesex, on the New River, eight miles north of London. An extensive trade in timber and other merchandise is carried on here by means of the Lea River navigation. The "Bell at Edmonton" has become famous by association with the adventures of John Gilpin. Charles Lamb died at Edmonton in 1834. Pop. (1901) 46,899.

Ed'mund, Saint, king of the East-Angles: b. Nuremberg 841; d. Oxon, now Hoxon, England, 20 Nov. 870. Edmund belonged, by blood, to the English-Saxon kings, but was not a direct heir to the throne. When Edmund was only in his 15th year, Offa, the king of the East-Angles, desiring to end his days in peace and penance, entreated him to accept the crown and become king. Accordingly he was crowned by Humbert, bishop of Elman, on Christmas Day 855, at Burum, a royal villa on the Stour, now called Bures. Although young in years, he was old in wisdom, and reigned with so much of justice and mercy that he was beloved by all his people. In the 15th year of his reign the land was attacked by the Danes, and they laid waste all the country through which they passed. The king tried to protect his people, but the Danes outnumbered them and spared none. Proposals insulting to religion were made to the king by the Danes, and the promise that his life would be spared if he complied; but the king repulsed their overtures because of the conditions. He was captured at Oxon and the terms, prejudicial to religion, were again offered and rejected. Hinguar, the Dane, exasperated at Edmund's refusal, ordered him to be beaten

with cudgels, and further most terrible tortures to be inflicted. Again he was offered terms of surrender, and again he refused. Hinguar at last ordered his head to be cut off. Saint Dunstan wrote an account of his death as witnessed by one who was armor-bearer of King Edmund. Some time after the body was removed from Oxon to Bedricsworth or Kingston, since called St. Edmundsbury from "bury" in Anglo-Saxon, which means court or place, and this town was Edmund's own patrimony. Consult: Lambert, 'Topographical Dictionary of England.'

Edmund, Saint, Archbishop of Canterbury: b. Abingdon, England, about 1190; d. Soissy, France, 16 Nov. 1240. His parents, Reynold and Mabilia Rich, who lived in humble circumstances, were noted for their piety. His first studies were made at Oxford, and from there he was sent to Paris, from which school he returned home at the death of his mother; but remained in England only long enough to attend to placing his sisters in good homes. After returning to Paris he devoted himself to the study of theology and the Scriptures, and for a time taught the Scriptures in Paris. Returning to England, after his ordination, he became a teacher at Oxford from 1219 to 1226; he was the first who taught Aristotle's logic at Oxford. He desired to work among the poor, and at his own request was transferred to Salisbury Cathedral. While at Salisbury he received a commission from the Pope to preach the crusade against the Saracens, which he did with the result that not only many of his hearers joined the crusade, but numbers became exemplary Christians. William, surnamed Longspear, the famous Earl of Salisbury, through the preaching and instruction of Edmund reformed his life and became active in good works.

Edmund had great power in teaching how to pray; he often said: "A hundred thousand persons are deceived in multiplying prayers: I would rather say five words devotedly with my heart, than five thousand that my soul does not relish with affection and understanding. 'Sing to the Lord Wisely.'"

In 1234 Pope Gregory IX. appointed Edmund as Archbishop of Canterbury. The chapter of Canterbury was unanimous in his favor and the appointment was pleasing to the king, Henry III., but when Edmund was informed of the "honors heaped upon him," he at first refused to listen to the committee appointed to wait upon him. He assured them that they were mistaken, and if not that he would not consent to become Archbishop of Canterbury. The bishop of Salisbury went to him and induced him to accept the office, and he was consecrated Archbishop of Canterbury on 2 April 1234. He at once entered upon a series of reforms in courts, monasteries, and among his clergy. Adversaries arose among those who ought to have been his advocates. His 'Constitutions' in 36 canons, dealing with matters of reform, are still extant. Troubles arose between Edmund and the king, when the king's greed sought various means to secure Church revenues. Both the archbishop and the king appealed to the Pope, who, failing to finally settle the disputes, left the archbishop almost powerless to cope with his adversaries. Fearing that by remaining he

might seem to sanction what he could not redress, he left the country secretly and went to France, where he received a warm welcome.

The testimony of his sanctity and miracles were so numerous that he was canonized in 1246, only four years after his death. Some of his works extant are: 'Constitutions,' to be found in 'Editions of the Councils' by Linwood, Spelman, Wilkins, Johnson, and Labbe; 'Speculum Ecclesiæ,' or 'Mirror of the Church'; and several of his works in manuscript, one on the Sacraments, are in the Bodleian library, Oxford. Consult: Wood, 'History and Antiquity'; Tanner, 'Notitia Monastica'; Butler, 'Lives of Saints.'

Edmund I., or Eadmund, king of England: b. about 921; d. 26 May 946. He was a son of Edward the Elder and succeeded his brother Athelstan in 940. He subdued Northumbria and the Five Danish Boroughs in 944, and in the following year conquered Cumbria, which he bestowed on Malcolm, king of Scotland, on condition of homage. He was killed at a banquet by Liofa, an outlaw.

Edmunds, George Franklin, American lawyer: b. Richmond, Vt., 1 Feb. 1828. He received a common school education, as well as the instructions of a private tutor; studied law, and began its practice in 1849. In 1851 he removed to Burlington, Vt. He was a member of the Vermont legislature 1854-9, being speaker 1856-9, and was a member of the State Senate, and its president 1861-62. He was by this time very prominent in Vermont politics, and at the opening of the Civil War, when a State convention assembled with the intention of uniting war Democrats and Republicans, he outlined the resolutions which the convention finally adopted as the principles of union. On the death of Solomon Foot, in 1866, Edmunds was elected to the United States Senate to fill Foot's unexpired term, and was thrice re-elected for full terms, resigning in 1891. During his quarter-century in the National Senate he served on many important committees, displaying the qualities of an able, accomplished statesman. He was a member of the electoral commission in 1877, and was the author of the act of 22 March 1882 known as the "Edmunds Act" (q.v.), which provided for the suppression of polygamy in Utah and the disfranchisement of any person convicted of practising it. He was also the author of the "Anti-Trust Law" of 1890. During the term of President Arthur he was president *pro tempore* of the Senate. In 1897 he became chairman of the monetary commission which had been appointed by the executive committee of the Indianapolis monetary conference. Since his retirement from the Senate he has devoted himself to his profession, and has a wide fame as a constitutional lawyer.

Edmund II., or Eadmund (surnamed Ironside), king of England: b. about 981; d. 30 Nov. 1016. He was a son of Ethelred II., and on the latter's death in 1016 was chosen king at London, whilst Canute was elected to the same dignity at Southampton. Edmund several times defeated the forces of the Danish ruler, but was himself defeated at Assandun (now Ashington) in Essex. A compromise was then effected, by which the midland and northern counties were assigned to Canute and the southern to Edmund.

Edmunds Act, passed by Congress 22 March 1882; an act to root out polygamy in Utah, not only by direct punishment but by barring out votes, public careers, and official action from polygamists. Mormons held control of the Territory not only through the local offices, but from the fact that all juries were composed of Mormons who would not convict their fellows or admit evidence of polygamy; and the act not only disfranchised but excluded from juries all who either practised polygamy or believed it rightful. The disfranchisement was even more effective, as Utah had woman suffrage, and each polygamous wife was disfranchised also. The act made the living with more than one woman in marital relations a misdemeanor, and several leading Mormons were convicted, including their delegate to Congress; which office, as well as all from justice of the peace to probate judge or sheriff, was made inaccessible to polygamists.

Edom, ʿēdôm, in the New Testament **IDUMÆA**, in ancient times a country lying to the south of Palestine. The Edomites are said in Genesis to be the descendants of Esau, who was also called Edom (a word signifying "red"), and who dwelt in Mount Seir, the mountain range now called Jebel Shera, stretching between the Dead Sea and the Gulf of Akabah. The Edomites were subdued by King David, and after the separation of the 10 tribes remained subject to the kingdom of Judah till the reign of Jehoram, when they revolted and secured their independence for a time. They were again subdued about half a century later by Amaziah and again in the reign of Ahaz, recovered their independence, which they maintained till the time of the invasion of Judea by Nebuchadnezzar. They fell under the rule of the Persians, and latterly their fortunes were merged in those of Arabia. The chief city in this region was Petra, which now presents remarkable ruins, rock-cut temples, and walls.

Ed'red, king of England: d. Frome, England, 23 Nov. 955. He was a son of Edward the Elder, and succeeded to the throne on the murder of his brother, Edmund I., in May 946. He quelled a rebellion of the Northumbrian Danes, and compelled Malcolm, king of Scotland, to renew his homage for his English possessions. Edred died after a reign of nine years, and left the crown to his nephew, Edwy.

Edriophthalmata, ed'ri-of-thäl'ma-ta, a name sometimes used for one of the great divisions of the *Crustacea*, including all those genera which have their eyes sessile, or embedded in the head, and not fixed on a peduncle or stalk, as in the crabs, lobsters, etc. These malacostracous *Crustacea* which were formerly included in this group are now generally called *Arthrostaca*, in which all of the thoracic segments, except the first and sometimes the second, are free from the head. It includes the orders *Amphipoda* or sand hoppers, whale lice, etc. (qq.v.), and the *Isopoda* or wood lice, pill bugs (qq.v.), and their aquatic allies, many of which are parasitic. A third order sometimes associated with these is the *Anisopoda* which includes small forms approaching the higher *Malacostraca* in several respects.

Ed'risi. See IDRISI, ABU ABDALLAH MOHAMMED.

EDSALL—EDUCATION IN THE UNITED STATES

Edsall, Samuel Cook, American Protestant Episcopal bishop: b. Dixon, Ill., 4 March 1860. He was educated at Racine College; became a lawyer in 1882, and later entered the Protestant Episcopal ministry and was graduated at the Western Theological Seminary in 1889. After several years of successful work as a pastor in Chicago he was elected missionary bishop of North Dakota in 1898, and was consecrated 25 Jan. 1899. He was translated to the diocese of Minnesota in June 1901, as coadjutor bishop, succeeding to the headship of the diocese on the death of Bishop Whipple a few months later.

Edson, Cyrus, American bacteriologist: b. Albany, N. Y., 8 Sept. 1857; d. 1903. He was graduated at the New York College of Physicians and Surgeons in 1881 and in the following year was appointed a sanitary inspector. In 1893-5 he was health commissioner of New York. He discovered a new treatment for consumption, malaria, and other germ diseases, in 1896, which he named *aseptolin*. His publications include about 80 papers on medical and sanitary subjects. He was the inventor of many surgical instruments.

Education, the developing of the human faculties; the imparting and acquiring of knowledge; technically the training of the young, physically, mentally, and morally. There are two recognized systems—discipline, or moral training, and instruction, or mental development. Under discipline are grouped self-control, obedience, civility, reverence, and the preservation of life, health and morals; under instruction come language and the arts, and the cultivation of taste, imagination, memory, and specific knowledge.

Education in the United States. Spontaneity is the keynote of education in the United States. Its varied form, its uneven progress, its lack of symmetry, its practical effectiveness, are all due to the fact that it has sprung, unbidden and unforced, from the needs and aspirations of the people. Local preference and individual initiative have been ruling forces. What men have wished for that they have done. They have not waited for State assistance or for State control. As a result, there is, in the European sense, no American system of education. There is no national educational administrative machinery and no national legislative authority over education in the several States. The bureau of education at Washington was not established until 1867, and save in one or two minor respects, its functions are wholly advisory. It is absolutely dependent upon the good will of the educational officials of the States, counties, and municipalities and upon that of the administrative officers of privately conducted institutions, for the admirable and authoritative statistics which it collects and publishes year by year. That these statistics are so complete and so accurate is evidence that the moral influence and authority of the bureau of education are very great, and that it commands a co-operation as cordial as it is universal.

National Government and Education.—But the national government has, from the very beginning, made enormous grants of land and

money in aid of education in the several States. The portion of the public domain hitherto set apart by Congress for the endowment of public education amounts to about 87,000,000 acres, or 135,938 English square miles. This is an area larger than that of the six New England States, New York, New Jersey, Maryland, and Delaware added together. It is a portion of the earth's surface as great as the kingdom of Prussia, about seven tenths as great as France, and considerably greater than the combined areas of Great Britain, including the Channel Islands, and the kingdom of Holland. The aggregate value of lands and money given for education by the national government, as Commissioner Harris shows in detail, is nearly \$300,000,000.

Education a State Function.—The uniform tendency of recent development, as marked by judicial decisions and by legislative enactments, is to treat all publicly controlled education as part of a slowly forming system which has its basis in the authority of the State government, as distinguished from that of the nation on the one hand and from that of the locality on the other. This system may be highly centralized, as in New York, or the contrary, as in Massachusetts, but the theory underlying it is the same. The two fundamental principles which are emerging as the result of a century's growth are, first, that education is a matter of State concern, and not merely one of local preference; and, second, that State inspection and supervision shall be applied so as to stimulate and encourage local interest in education and to avoid the deadening routine of a mechanical uniformity. The State acts to provide adequate opportunity for elementary education for all children, and abundant opportunity for secondary and higher education. But the State claims no monopoly in education. It protects private initiative, whether stimulated by religious zeal, philanthropy or desire for gain, in doing the same thing. It is not customary, in the United States, for State officials to inspect or to interfere with the educational work of privately established institutions. When these are chartered bodies, they are subject simply to the general provisions of law governing corporations of their class. When they are not chartered bodies, the State treats them as it does any private business undertaking: it lets them alone. Standards of efficiency and of professional attainment are regulated in these institutions by those in neighboring public institutions, by local public opinion and by competition. Sometimes these forces operate to raise standards, sometimes to lower them. New York has gone farther than any other State in attempting to define and to classify all educational institutions, private as well as public. Pennsylvania has recently entered upon a similar policy; and it is being urged in other States as well. The public elementary schools are more or less carefully regulated by law, both as to length of school term, as to subjects taught, and as to the necessary qualifications of the teachers. The public secondary schools, familiarly known as high schools, and the State universities are usually without any such regulation.

Statistics of Public Education.—The term "common schools" is often used in the United

EDUCATION IN THE UNITED STATES

States of the public elementary schools alone; but the more correct use is to include under it all public elementary schools,—the first eight years of the course of study,—and all public secondary schools, maintaining a four years' course, as a rule, in advance of the elementary school. In 1900-1 the total estimated population of the United States was 77,262,743. Of this number 21,897,678 were of school age, as it is called; that is, they were from 5 to 18 years of age. This is not the age covered by the compulsory education laws, but the school age as the term is used by the United States census. By school age is meant the period during which a pupil may attend a public school and during which a share of the public money may be used for his education. It is obvious, then, that persons who have satisfactorily completed both an elementary and a secondary course of study may still be returned as of "school age" and as "not attending any school." This fact has always to be taken into account in the interpretation of American educational statistics.
